
Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past 14 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that is claimed for it and give entire satisfaction.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.
First, the flanges or edges of our belt stand at an acute angle tnolining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and orming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that wonld otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.
H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Professional.

STEPHEN H. EMMENS,
Consulting Engineer and Chemist,
Youngwood, Westmorland County, Pa.

Electricity.

Do Lightning Rods Protect.

The occasional destruction of buildings on which lightning rods are erected have more than once excited doubts as to the value of the latter as projectors from Jove's thunderbolts. In some cases it has been possible to trace any observed inefficiency to improper construction, to bad ground connection, or to damage done (as by acid fumes from neighboring factory chimneys) to rods which were once reasonably trustworthy. But in other instances the utter annihilation of a house, factory or church by fire as a result of a stroke of lightning has made it impossible to investigate the condition of the apparatus; and hence the questions excited in people's minds by the apparent failure of the rod to perform its function remain unanswered; nor has it tended to restore public confidence to notice what wide differences of opinion exist among experts as to the theory on which these devices operate, if they protect at all, and as to the proper form to give them if they are to do good instead of positive harm.

Scarcely had the Lightning-Rod Conference of Great Britain, after elaborate research, decided (in 1888) that the rods were really desirable contrivances, that a solid rod was better than a metallic tape, and that any flash, no matter how intense, might be safely conveyed to the ground, before another eminent Englishman, Dr. Oliver J. Lodge, presented some considerations which took his fellow-scientists rather aback. He insisted that lightning is sometimes, if not often, an oscillatory performance, the electric current surging to and fro between the sky and the earth like a pendulum instead of pouring all one way as do the contents of a sewer-pipe. This fact (if it be one) and the excitement of a separate set of electric oscillations by mere induction led him to protest against trying to coax the lightning and conveying downward all the atmospheric electricity which any overhanging clouds may manufacture. The policy he advised was to carry off as little as possible, not as much, and not to connect the rod with the gas and water-pipe systems of a house or the town, but to give it an independent "ground" or connection with the layer of perpetual dampness in the earth. The old theory of drawing from a cloud gradually was all right, he said, if the supply would always come gradually; but no sewer could accommodate a bursted mill dam, and he insisted that wholesale and instantaneous discharges of electricity, which he called "impulsive rushes," would occasionally occur, to which no lightning rod would be at all adequate. It would simply invite disaster. The rod, then, should be so small, according to his ideas, as to discourage the fluid from attempting to flow—a mere wire, in fact. To this form, however, he rather preferred a tape, as the latter gave more conducting surface for the same amount of metal.

Alexander McAdie, now connected with the United States Weather Bureau, and an original investigator of these matters for years, has an article on them in the *Popular Science Monthly* for August. He favors the use of rods, prefers copper to iron; would have them weigh six ounces to the foot if of the former metal, and two pounds if of the latter; accepts Lodge's idea about flat conductors; says that chain or link conductors are of little value; advises putting clusters of points here and there along the ridge-rod, and regards an independent "ground" better than connections with gas and water mains. "The top of the rod," he adds, "should be plated, or in some way should be protected from corrosion and rust." It would be hard to find a more trustworthy authority on the subject than Mr. McAdie.—New York Tribune.

Gas versus Electricity in Paris.

Apropos of the struggle between gas and electricity in Paris, it may be of interest to mention that from the report of the Paris Gas Company it appears that the consumption of 1892 was 3,500,000 cubic metres less than in 1891. The decrease falls wholly on the night service, there being an increase in the day consumption for cooking, gas motors, etc., or 27 per cent of the total consumption. The total earnings for the year amounted to 104,800,000 francs, comprising for gas 79,500,000 francs and for coke 17,250,000 francs. The expenditure amounted to 70,170,000 francs, of which 27,245,000 francs were for coals and other fuel. The share of profits of the City of Paris for the year amounts to 17,000,000 francs. The gas company charge 30 centimes per cubic metre to ordinary customers and 20 centime to city works, theaters, etc. The rates are considered by the public too high, but the company rejoins that it is excessively taxed, having, for instance, to pay an octroi duty of 9½ francs per ton of coal.

Electricity Made Perfectly Plain.

An old man from somewhere among the suburbs stood on a Forty-seventh street corner watching a trolley car moving swiftly eastward with a heavy load of passengers.

"That's some of these 'lectric cars, ain't it?" he said, turning to a bored-looking man who was leaning against a telegraph pole.

"Yes."

"I don't see how 'lectricity can make a car full o' people flip along over the ground like that."

"You don't?" exclaimed the other, becoming interested. "Why, it's easy enough to see through when you once understand it."

"I 'xpect so; but I've never heard enough about it to understand it."

"It is all a matter of watts. A watt, don't you see, is a fraction of a horse power expressed in the technical language of electrical engineering. You know what an ampere is, don't you?"

"A what?"

"An ampere. It is a quantity of electricity that goes through the wire and develops the watt. The electricity comes from the central dynamo through that wire you see running along overhead, runs down through that iron pole and goes to the motor, which is an ingenious but perfectly simple arrangement of wire coils with a revolving frame, acted upon by the current, which sets it to spinning and thus puts in motion a small cog-wheel that engages another cog-wheel that communicates the rotary movement to a third cog-wheel fastened to the axle of the car. It is as plain as day when you get the idea."

"Yes, but how—"

"Don't you understand it yet? There's a sort of wire brush that presses against a copper plate connected with the motor, and the wire is wound on the frame I was telling you about, so that when the current enters the motor it can go either way, and part of it goes one way and part the other, so that the pressure is applied in opposite directions, and that's what makes the jigger revolve and sets the wheels in motion. The current goes back through an underground wire. See through it now?"

"Y-yes. I think I kind o' get the idee."

The affable stranger strolled down the street and the old man took another look at the overhead wire, gazed earnestly in the direction in which the car had gone, took off his hat and wiped his forehead.

"What I'd like to know," he muttered, "is how in thunder the electricity makes the car go."—Philadelphia Inquirer.

An Electric Jute Mill.

The *Mexican Trader* states that Mr. Thomas F. Kinneil, the holder of a concession for the establishment of jute factories at Orizaba and elsewhere, has already secured the capital necessary for the erection of the first factory, which will be situated at Barrio Nuevo, Orizaba. The shares, amounting in the aggregate to £100,000, have been placed in London. The foundations of the factory have been dug out, and those for the house are being prepared. Work on the canal and tunnel is progressing, and both will shortly be finished. The waterfall at Barrio Nuevo is a very fine one, its force equalling an 11,000-horse power. The factory will be situated 1¼ miles away from, and some 600 feet above the level of, the wheel-house. Pelton wheels will be exclusively used, and enough of the electric power generated to drive the machinery. The head-race will be 321 feet in length, and from the head-race the water will be conveyed in pipes to the wheel house. The fall will be 115 feet. Four dynamos will be used, and every machine in the factory will have a motor of its own, varying from 1 to 20-horse power. This will be the first jute factory in the world driven by electricity. The whole of the electric plant has been ordered in England, and will be the largest of its kind—*i. e.*, used for driving a single factory—in the world. The plant has been made specially for the factory. The factory will be built of iron and corrugated iron. The fact that no belting or shafting will be used enables the company to dispense with solid masonry, etc., which would otherwise be necessary, and thus a great saving will be effected. The Santa Gertrudis Jute Mill Company, Limited, by whom the venture is being made, intends manufacturing all articles which can be made of jute, and hopes soon to have its machinery, etc., all erected, so that operations may be commenced with the least possible delay.

REMARKABLE ELECTRIC RAILWAY.—Should the plans prepared by an Italian electrical engineer, Signor Avena, be realized in Naples, Italy will boast one of the most remarkable electric railways in the world. The length of the line is not great, but the idea is bold and original. The railway is intended to establish connection between the districts around Via Roma and the Corso Vittorio Emmanuele, and the line is to be carried across two viaducts built of iron. A stone tower is to be built at the Via Roma, whence the first viaduct, 360 meters long, is to lead to the Corso Vittorio Emmanuele, where it finishes in a tower 150 meters in height. The second viaduct, 290 meters, is to run from this tower to the Via Rione de Vernero.

A NOVEL ORGAN.—It was recently reported that St. Thomas' Church, Taunton, Mass., had imported an organ from Europe, which was something remarkable as a novelty, by reason of its mechanism being controlled by electricity. An experienced organist in Brooklyn, having examined the descriptions, says that, with the exception of some details, the invention is far from new. Organs have been worked by electricity in this country for years. The movable keyboard, or "console" is original, however, and possibly some of the mechanism for mixtures and transposing music from one key to another.

Useful Information.

The Iron Industry.

The official statement of the Iron and Steel Association shows that, in spite of all discouragements and obstacles, the great industry produced and consumed an enormous quantity of iron in the first half of 1893, though a little less than in either half of 1892. The production was 4,562,918 gross tons, but the stocks unsold increased from 535,616 tons January 1 to 578,831 June 30, so that the quantity approximately representing consumption in the manufacture is 4,519,703 gross tons. This is about 100,000 tons less than was consumed in either the first or second half of 1892, but the difference is little more than 2 per cent.

It is true that over 200,000 tons more iron was produced during the first half of 1892, but unsold stocks increased 148,000 tons, so that the approximate consumption was 4,621,062 tons. In the second half of last year production was less, only 4,387,317 tons, but unsold stocks were reduced 240,000 tons, so that the approximate consumption was 4,627,555 tons. In the first half of 1891 production was greatly interrupted, amounting to only 3,368,107 gross tons, but unsold stocks were considerably reduced, and the approximate consumption was only 3,544,462 tons. But much of the work waiting to be done was only carried over into the second half of the year, when both production and consumption rose to the highest point yet attained, the production to 4,911,763, and deducting increase in stocks the consumption was 4,776,385 tons, a part of which was by way of compensation for the interruption during the first half of the year. These estimates do not take into account the small supply going into consumption from foreign imports, which is not definitely ascertained by half years. Reckoning thus roughly, from production and reported domestic stock only, the approximate consumption by half years has been:

	First half, tons.	Second half, tons.	Total, including imports.
1890	4,496,854	4,321,519	8,959,679
1891	3,544,462	4,776,385	8,381,674
1892	4,621,062	4,627,555	9,318,748
1893	4,519,703	.....	.....

It will be seen that, with many furnaces and works now idle, there is little chance that the production or consumption of 1893 will reach the record of former years, remarks the New York *Tribune*, commenting on the figures. But it is a fact of interest that the orders obtained and the contracts made months ago, before the people had voted for a change, were large enough to sustain the manufacture during nearly the whole of the first half of 1893 at about its maximum activity. For three years and a half, excepting only the interrupted half of 1891, this industry has gone on at a rate far surpassing the utmost that ever has been accomplished in Great Britain, either as to quantity of iron produced or as to quantity consumed in the market.

British production last year, according to the British Iron Association, was only 6,616,890 tons—the smallest since 1879. Although stocks were reduced about 540,000 tons, the quantity exported without manufacture was 767,000 tons, so that the consumption in the manufacture in Great Britain was 6,391,650 tons, which is less than the consumption in this country in either of the last six years. But if the advocates of a change have their way, our country may fall back to a second place again.

Comparative Values of Timber.

In a lecture on timbers used for railway purposes, delivered hy Mr. Goff, at the Railway Institute, Sydoey, New South Wales, it was stated that timher when perfectly dry lost about one-third of its weight, and the following timbers shrink in breadth in drying as follows: English oak, 1·12; Riga fir, 1·32; Dantzic, 1·38; elm, 1·24; yellow pine, 1·38; pitch pine, 1·40; and kauri, 1·64. In his comparison Mr. Goff took English oak as a standard of measure of the qualities of strength, stiffoess and toughness, and explained that by strength he meant the property whicb resists fracture or breakage whether as a beam or post; stiffoess, the quality of resistance to flexure or beoding; and toughness, the power to bend the most before fracture. The following table of comparative qualities of various woods was presented:

Variety.	Weight per cubic ft.	Strength.	Stiffness.	Toughness.
British oak	45 to 58 lbs.	100	100	100
Baltic Riga oak	43 to 54 lbs.	108	93	125
American oak	37 to 47 lbs.	86	114	117
Danizic oak	42 to 53 lbs.	107	117	99
Elm	35 to 46 lbs.	82	78	86
Pine or fir	29 to 42 lbs.	80	114	58
Poplar	33 lbs.	86	66	112
Mahogany	35 to 53 lbs.	96	93	93
Tamarack	32 to 40 lbs.	102	88	130
Walnut	50 lbs.	90	70	110

Try, Try Again.

Darning thin places in blaokets as you would stockings.

Rubbing out grease on a carpet with cornmeal.

Whiting and benzine mixed together to clean marble.

Wiplog colored matting with salt water.

Chlorinated soda for ink stains.

Cleaning brass with hot water, rubbing, then, with a soft cloth and lemon juice, rinsing in hot water and polishing with a chamois.

Cleaning willow with salt water.

Shuttlog a boiler of boiling water in a room from which the paper is to be removed.

Weak lye, or saleratus water, for cleaning paint.

This grease eradicator: Two ounces of ammonia, one ounce of soap-shavings, one quart of soft water and one teaspoonful of saltpetre.

Having all flannel or broadcloth goods sponged before making up, to prevent spotting.—Good Housekeeping.

PINE NEEDLES VS. MOTHS.—I have just been circumventing the wily moth, and as I dislike the odor of camphor and tar as much as ever they do, I seldom use either. I once packed a balsam fir pillow away among my woolens, and neglected to take any precautions against moths in that trunk. I was almost afraid to open it the next fall, expecting to find things in it rnined, but a fragrant odor of pines greeted my nostrils and not a sign of moth. I took the hint, and ever since have used pine needles in place of the odious carbolated preventives. Every one knows they won't go near cedar. I wish my lady readers would try my plan and make bags of pine needles to put among their packed-away woolens. Another delightful preventive is to make sacbet bags of ground spices, cloves, cinnamon, allspice and orris root. This, of course, is quite expensive and is used only for my especially nice things.—Indiana Farmer.

EFFECT OF TOBACCO ON BOYS.—The boy who smokes saps his physical strength. In boat races and games of baseball, cricket, bicycling and other athletics the habitual smoker stands no chance against the young man of pure, cleanly and temperate habits. Some investigations have recently been made which convey a startling warning to smoking boys. From measurements of 187

students in Yale college it was found that those who let tobacco alone gained over those who used it during the college year 1892, 22 per cent in weight, 29½ per cent in height, 19 per cent in girth of chest, and 66 per cent in lung capacity. Measurements at Amherst college showed even greater difference in favor of those who did not use tobacco. With such evidence as this before him, no sensible boy is likely to try to cultivate the tobacco habit, or to cling to it if he has already acquired it. Give the boys more opportunities for atheletics and they will require less tobacco.—Troy Times.

THE PIANO AND TEMPERATURE.—This is the gist of what an expert has to say regarding care of pianos, in the *Recorder:* "The most serious injuries that befall pianos are usually the results of temperature; either it is too dry or too damp. The incompetent tuner does great harm, but the extremes of hot air and moisture do more harm than all the tuners alive. If your house is heated by a stove, put your instrument in a room without a stove—in one that is heated from an adjoining room. If you have steam or furnace heat, your piano will do better if kept in a room that is not quite warm enough for comfort. You know the sounding-board—the life of a piano—is forced into the case when it is pressed so tightly that it bulges up in the center. The wood is supposed to be as dry as possible, but of course it contains some moisture, and gathers a lot more on damp days and in handling. Now, when you put a piano in an overheated dry room, all this moisture is dried out and the board lose its 'belly' and gets flabby and finally cracks. Even if it does not crack, the tone loses its resonance and grows thin and tinny, and the felt cloth and leather used in the action dry up, the whole mechanism rattles, and the piano is blamed."

TO PROTECT PILES. — Dr. Willis E. Everette of Tacoma, Wash., appeared before the local Harbor Commissioners last week and told of a chemical preparation he has compounded. It preserves piles from teredo, and lumber from the ravages of all sorts of insects. It renders the wood non-inflammable. If Dr. Everette's discovery is what is claimed, it is indeed very valuable. Its usefulness will be appreciated not only in San Francisco, but on Puget Sound, where the average life of the unprotected pile is two years.

THE cough or puff of a railway engine is due to the abrupt emission of waste steam up the chimney. When moving slowly the coughs can, of course be heard following each other quite distinctly, but when speed is put on the puffs come out one after the other much more rapidly, and when 18 coughs a second are produced they cannot be separately distinguished by the ear. A locomotive running at the rate of nearly 70 miles an hour gives out 20 puffs of steam every second, that is, 10 for each of its two cylinders.

STEEL FOR STAMPING DIES.—Steel for stamping dies should be softer than steel for cutting dies. So, also, there should be a difference in cold and hot cutting dies. One who makes die steel a special study soon becomes aware of this difference. The die-worker should use only a slow fire.—Hints on Steel.

ACTUAL BUSINESS PRACTICE.

Established 1863 PACIFIC Business College, 320 POST ST. SAN FRANCISCO. Established 1863

LIFE SCHOLARSHIPS, $75.

Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON, Pres.

DEWEY & CO.'S

Scientific Press Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

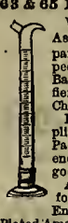
IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco



We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.C.o BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION — JUST OUT.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 60 cents additional per volume.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

THE McGLEW ORE CONCENTRATOR COMPANY.

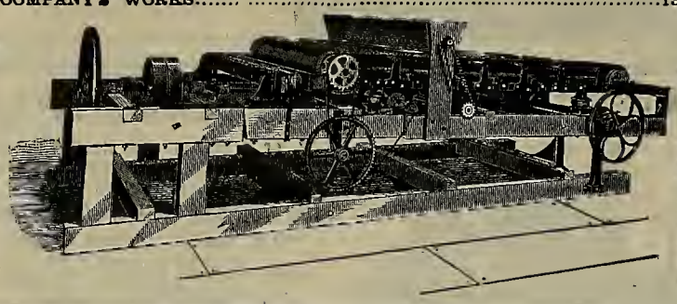
{PATENTED May 5th, 1893.} CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. {FRANK BARRERE, Secretary.}

CAN BE SEEN IN OPERATION AT THE COMPANY'S WORKS.....132 MAIN STREET, SAN FRANCISCO, CAL.

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

MR. THOS. McGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a True, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

Coast Industrial Notes.

—Gila canal has been opened in Arizona and water turned in.

—Salted seal skins have advanced from $14 to $18, following the Behring sea decision.

—Considerable building is going on at Susanville, Lassen county, recently devastated by fire.

—A new racetrack near San Mateo is talked of. The total cost will be between $50,000 and $65,000.

—The citizens of Haywards have decided to bond the town for $33,000 for the construction of a system of sewerage.

—Fires in the State of Washington Tuesday destroyed $40,000 of property as follows: Fairfield, $12,000; Winlock, $28,000.

—It is proposed by Australia coal mines to reduce the price per ton from 10 to 9 shillings. The difference in this city will be about 25 cents per ton.

—J. L. Weaton and E. L. Cooksey have purchased the machinery in the old Hartwell sawmill in American Valley, Plumas county, and intend to move it to Indian Valley and erect a mill there.

—Every transcontinental line, including the Canadian Pacific, has agreed to be represented at the meeting to be held at Chicago August 28th to advance the present war basis of freight and passenger rates.

—The icing of the refrigerator cars is quite an industry at Boca, Nevada county, and affords employment for about 70 men. The number of cars iced per day is from 15 to 25, and are iced for carrying fruit.

—At Grass Valley the city trustees have been requested by the Board of Health to devise some means of providing a sewerage system by submitting the proposition to a vote of the people or by some other method.

—The new ice-houses at Prosser Creek, Nevada county, are progressing finely and are nearing completion. About 80 men are employed in the construction of these buildings, which give this vicinity a lively appearance for a short time.

—The commission appointed to select a site for a State normal school in Whatcom county, Washington, has voted to accept ten acres between New Whatcom and Fairhaven, a beautiful locality on the heights overlooking Bellingham bay.

—The sawmill of A. McIntosh & Sons, between La Porte and Strawberry valley, Plumas county, was burned to the ground recently. The mill and all the machinery is a total loss. The fire also consumed a big pile of lumber, shingles, etc. It was the work of an incendiary.

—The Northern Pacific employes, believing they furnish the most of the ready money in circulation in Tacoma, have determined, in view of the reduction in wages, to establish a local supply store, if the local retailers refuse to sell at prices as low as at San Francisco, Chicago and other large cities.

—The first detachment of the Royal Marine Artillery to replace C Battery, R. C. A., consisting of three non-commissioned officers and fourteen gunners, has arrived at Victoria, B. C. All are trained for submarine work. It is presumed they will construct the submarine portion of the Esquimalt fortifications.

—At a meeting of the stockholders of the Mokelumne Water Company held at Lodi recently, the Board of Directors was empowered to issue bonds in the sum of $500,000 for the construction of the irrigation ditch. The lateral surveys have already been made, and work will commence on the ditch at once.

—The Board of Supervisors of Stanislaus county has granted a franchise and right of way to Messrs. Dunlap and Woodside for a proposed electric road over and along the county-road, from the town of Oakdale to the county line of Tuolumne. The latter is expected to grant a franchise from the county line to the town of Sonora.

—Track-laying on the Baden extension of the San Francisco and San Mateo electric railway is nearly completed, the road-builders having reached Baden last week. In less than a month the road will be in operation direct from the ferries to the Baden packing-houses, and the residents of that town will enjoy a ten-cent fare from their city to San Francisco.

—The steamer Mascotte, built and equipped in Victoria especially for wrecking, and owned by J. C. Prevost, Registrar of the Supreme Court, was totally destroyed by fire last week while lying at anchor in Pachena bay, a point on the coast between Cape Carmanah and San Juan. Mr. Prevost is advertising for bids to construct a new vessel, on the same plan but much larger.

—It has been decided to go ahead with work on the dome for the rotunde of the San Francisco city hall, the design best known as "Mayor Ellert's plan" having been accepted and the octagonal shaft formerly proposed, discarded. The height will be 250 feet from the ground. Architect Shea has been directed to draw plans and specifications for letting the necessary contracts.

—A free restaurant for the unemployed has been established on the new postoffice site in this city. The lumber has been donated, the use of the ground has been obtained by arrangement with the Federal authorities, the work was performed by the men themselves, and the public will be looked to for the materials wherewith the needy may be supplied with simple food in the landlot kitchen.

—Standard barrels of cement are selling in San Francisco at from $2.25 to $2.30 a barrel. One of the leading contractors purchased 1000 barrels from Balfour, Guthrie & Co. some time ago at $2.20 a barrel and 1000 barrels of Balfour, Guthrie & Co. at $2.30 a barrel. These prices are for cement at the warehouses. Of late dealers say there has been a stiffening in the market and that prices will rule a trifle higher.

—The water in the Tuolumne river has receded very rapidly recently, save the Modesto *Herald*, and all of the water is now running through the waterways of the joint dam which will allow the work to proceed for the balance of the dry season without interruption. The force of laborers will be increased fully 200, and the work pushed to completion. There is but little, if any, doubt that the dam will be completed by January 1st next.

—It has incorrectly been stated that 1000 men have been discharged from the Southern Pacific railroad tunnels at Santa Margarita. Altogether there is a force of 1200 men at work on the tunnels and grade. Four hundred men are all that have been discharged, the contractors being so nearly through grading that it was found necessary to discharge part of the working force in order that the tunnel may be finished at the same time as the grading.

—The cannery men of the Columbia river made another attempt Tuesday to get together and form a combination for mutual protection. There was a large attendance, nearly every cannery on the river being represented. Matters were finally left in the hands of a committee, which was empowered to map out a scheme for handling all the canneries under one head and to draft articles of incorporation. It is doubtful whether the new idea will be carried out.

—Local arrangements are said to be practically concluded whereby brick will go up $2 a thousand and there is a prospective rise in lumber and a slight advance in cement. Eight days ago hard brick was selling for $7 a thousand. The price will now be quoted at $9. The principal brickyards from which this city obtains it supply are situated in Alameda, Santa Clara, Marin, Contra Costa and Sacramento counties. The trust consists of an understanding among a large number of brickmakers not to sell below $9 a thousand.

—During the year ending June 30, 1883, the gross receipts of the S. F. Postoffice amounted to $558,954.18. In the year ending June 30, 1893, this had been raised to $820,505.92, a gain of $261,551.74. This makes a gain in the gross receipts of 1893 over those of 1883 of over 45 per cent, although letter postage had in the meantime been lowered 33⅓ per cent and the rate on second-class matter 50 per cent. Without doubt the receipts for 1903 will be at least 60 per cent greater than those of to-day. This will bring them up to about $1,250,000.

—During the time from May 30th to June 15th of this year, six shipments of trout eggs, aggregating 736,000, were sent from Shovel Creek Fishery at Klamath Springs to the Sisson hatchery. Of these, Mr. Richardson has succeeded in hatching out 99 per cent. During the month of July, shipments of young trout were made as follows: Coffee creek, the headwaters of Trinity river; Castle lake, Bogus creek, Angel creek, Shovel creek, Butte creek, Antelope creek from 3000 to 5000, and each of *Salmo fontalis*. Ten thousand young rainbow trout were placed in the headwaters of the Yuba river and a like number in the headwaters of the American river. On August 2d 20,000 rainbow trout were shipped to Carmel reservoir at Pacific Grove. On August 4th the following shipment of rainbow trout was received at Truckee and distributed as follows: Prosser creek, 25,000; Deer Park creek, 1500; Squaw creek, 5000; Railroad creek, 5000; Deer creek, 5000; Donner creek, 500; California, stream, 500. Total, 42,500. All these streams are tributaries to the Truckee river.

—Experimental cheap rates were introduced by the Sunset Telephone and Telegraph Company Monday between the exchanges of San Francisco, Oakland, Alameda and Berkeley. Between subscribers in San Francisco and in any of the other places mentioned the tariff for messages is 15 cents for the first minute and five cents for each additional minute. The time is calculated from the commencement of the conversation and recorded by a time-clock stamp. Non-subscribers will be charged 25 cents for the first minute and five cents for each additional minute. These rates will be maintained for 60 days.

—San Jose is talking of having steel and iron works, erected by H. A. Jones of the Donohoe Steel & Smelting Company, San Francisco. Mr. Jones claims that by his process and methods a steel superior to Bessemer can be produced $5 a ton cheaper than the Bessemer made in Chicago, and by a plant five-sixths cheaper than required for the Bessemer. In his process he requires a superior quality of gas, and this also with power for generating electricity could be furnished very cheaply from such works as he proposes. A plant with a capacity of 100,000 tons of steel a day could be erected for $100,000.

—The earnings of the Southern Pacific railroad for the first six months of 1893 are said to show a material increase over the same period for 1892. The gross earnings for the first half of the year were $23,160,620, the lines west of El Paso being credited with $16,725,698, and those east of El Paso with 6,434,922. The increase on the lines east of El Paso over the same period of last year has been about 10 per cent and about 5 per cent on the lines west of El Paso. In other words, the lines east of El Paso earned gross the first half of this year $589,022 more than was the case for the first six months of last year. The lines west of El Paso show a gross increase of $459 964. The increase in net earnings is about $400,000.

—Contractor Bull is making rapid progress with the work of building the retaining wall on the east side of Humboldt harbor. There are 27 feet of water there now at half-tide, but owing to a mud bank the water shallows down to 15 feet. The retaining wall is run out about a half-mile, and from 500 to 800 tons of rock are being dumped there daily. No small rock can be used on the breakwater, so great care is exercised to have only rock of good size. As the current runs very close to the south wall, and threatens to wear it away somewhat, an effort is being made to turn the channel, and the jetties have done some good. The building of this seawall will cost the Government about $1,500,000.

—The great Sutro swimming baths at the ocean beach near Sutro Heights, in course of construction during the last seven years, will, when completed, take rank among the wonders of the Pacific coast. The tanks are now being roofed over. They are six in number, the largest being 285 feet long and 150 broad. There are to be 500 dressing-rooms. Mr. Sutro's provision for electric lighting is on a large scale. The plant will cost not less than $30,000. It includes 1000 16-candle power incandescent lamps, 20 arc lights of 2000-candle power each, a 20,000-candle power search light and a great reserve storage system. By means of chromatic lenses the search light will make the waves luminous with different colors.

—The Amador Electric Light Company has entered into a contract with the Blue Lakes Water Co. for supplying water for general lighting purposes in Jackson, Amador City and Sutter Creek for a term of 20 years. It is proposed to furnish arc and incandescent lights to Jackson, Amador City and Sutter Creek at a cost to the consumers which will not exceed the expense of burning oil. An electrical engineer will arrive at Sutter Creek in a day or two for the purpose of making surveys, maps, etc., and immediately thereafter the work of putting up the line will begin. Suitable buildings, etc., will be erected in the place of the present structures. The following are officers of the Electric Light Company: Pres., E. C. Voorhies; Vice-Pres., H. H. Towns; Treas., Anglo-California Bank (Limited); Sec'y, C. R. Downs.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BIG YIELD.—Sacramento *News*: The Kennedy mine last year sent over $600,000 to the Mint, and yields regularly every month from $60,000 to $70,000. It is operated with two shafts, one of which has a depth of 1600 feet, the other 1700 feet. J. F. Park, a practical miner, is the superintendent. This mine alone gives employment to 127 men, whose wages are from $2.50 to $3.50 per day, with a pay day once a month. The mill is but one mile from the town of Jackson. A little town has sprung up around the mine, with hotel, stores, etc. The mine, mill, buildings and grounds are lighted with electricity. From present appearance the rich ore in this mine cannot be exhausted for many years.

SHAFT REOPENED.—*Ledger*, Aug. 18: F. Mace and son, P. B. Mace, have reopened the old Modoc shaft, located near Pioneer creek, and are working two shifts of men in its development. The Argonaut Company commenced work upon their property, the Pioneer mine, last week, cleaning out the shaft and getting ready for the extensive development of the property contemplated. At the Hardenburgh the sinking has been completed, the shaft now being 800 feet in depth with a 50-foot enlp. The intention of the owners, Hayward & Lane, is to cut a station at the 800 and drift into the ledge, making a thorough prospect of the property at this level. At the Albany, drifting is now in order. In the Astoria the Littlefield tunnel is still being extended across the country rock with favorable prospects.

CONTRACTS LET.—Amador *Record*, Aug. 17: Two contracts have just been let for the Belmont gold mine at this place—one to drain the Boss shaft down to the 200-foot level and then drive a drift from that point 224 feet; also to extract ore on the south end of the mine and run the company's ten-stamp mill. This work will necessitate a pay-roll of from 12 to 15 miners. The work will be carried on judiciously and systematically under the direction of Supt. Tibbits. The shaft at the South Eureka mine is now down 900 feet. According to the present rate of work, the 1000-level will be reached in another month. The favorable indications encountered on the 500-level make it almost certain that a big mine will be developed when the new level is opened up. Active operations are being inaugurated at the Bunker Hill mine near Amador City. Several men have been put to work and the force will be gradually added to. Supt. Myers is kept busy putting everything in shape, and soon that camp will present the same lively appearance that it did several years ago. The Bunker Hill is a finely located property, and there is not the least doubt that it will develop into a paying one. The mine is well equipped, so that a vast amount of preliminary work and expense is done away with. It is simply a question of going to work at once on the ledge.

Calaveras.

LIVELY AT ANGELS.—Nevada *Transcript*: Mr. N. C. Farnum informs us that everything in the mining line is prosperous in Calaveras county and is looking better now than it has been in years gone by. The Utica mine at Angels Camp, owned by Hobart, Hayward and Lane, is looking exceedingly well, and pays out $100,000 per month in wages. The prospects and mines all around the place give the most flattering prospects, and the owners are all anticipating a larger yield of gold this season than ever before. The company will soon add 100 stamps to the 200 already in operation. The Grover mine, Mr. Farnum informs us, is situated between Drytown and Amador City. The depth of the mine is 1100 feet, and up to within the last 40 days the mine has scarcely paid, it having been close work to meet the expenses. It is different now. Within the last 40 days the miners have cut into quartz that pays $20 per ton and the quartz is plentiful. The mine is being pumped to the depth of 900 feet by electric-power, and now the company will go to work and put in electricity as a motive power for its entire working. Mr. Farnum says that the miners and managers over there have come to the conclusion that the country has only been "skimmed," and that deep mining is the thing that pays.

Lassen.

GOLDEN EAGLE SOLD.—Lassen *Advocate*, Aug. 17: The Golden Eagle mine, one of the oldest and best paying mines at Hayden Hill, and owned by Mr. Hopkins of Susanville, was sold on the 8th inst. to Mr. W. B. Scott of Toledo, O. The price paid was $10,000. The mine is worth every dollar of the price paid. The new proprietor has already put on a good force of men. Hayden Hill undoubtedly has some fine paying mines.

Nevada.

WORK COMMENCED.—*Telegraph*: For the past 22 years the Stockton mine, located about four miles south of Grass Valley, near the ranch of Dawson Handy, has been idle. The ledge was worked about 22 years ago by a company of men from Stockton, and they only sunk the shaft down to about 130 feet. There has been $60,000 in gold taken from the ledge during its activity. A gentleman from Colorado named J. Burrowe has charge of the property and is representing a company of men with ample means, and they intend to thoroughly prospect the ledge. Work of cleaning out and repairing the shaft has been commenced and a whim has been erected. The ledge is quite small as far as the bottom of the shaft, but indications show that it will widen as depth is attained. There is an abundance of water power

at hand and ths shaft will be sunk as rapidly as possible.

Placer.

RIVER MINING.—Placer *Herald*, Aug. 19: F. H. Bell, A. Ambrose and A. F. Bigelow have a forcs of 15 or 20 men at work prospecting and developing a gravel claim on what is known as Brown's Bar on the Middle Fork of the American river a short distancs abovs Mammoth Bar. A good many years ago this Bar yielded with ancient appliances some $90,000 as the resnlt of one summsr's work with a small force of men. Those working it now get a good prospect, and are confident iu tbe belief that, when thoroughly opened, it will yield them a good deal of money.

AT WORK IN EARNEST.—*Herald*, Aug. 22: B. F. Hartlsy and son Frank, H. Qnine and F. L. Evans arrived from the East Thursday. Mr. Hartley has incorporated his mining interests at Ophir, as stated last wesk, into the Colnmbia Gold and Silver Mining Co., of Denver, with a capital stock of $600,000. It looks as thongh the company mean bnsiness, for a largs dynamo and other machinery have arrived, and Mr. Hartley says they will commence work ou an extensive plant immediately. A large boarding-house and the necessary auxiliary buildings will be first erected, and the whole property will bs lighted by electricity, thus facilitating the working of day and night shifts. Mr. Hartley thinks he has a good mine, and says he intends to create aud stimulate a mining industry in the Ophir district hitherto uuknowu siuce the days of '50.

Plumas.

WORKING ON A DITCH.—Plumae *Independent*: The Slate Creek Company has at present 35 or 50 men at work on the ditch and finme. Wm. Metcalf employs eight men ou hie logging contract and eight yoke of cattle in the delivery of logs at the company's mill.

MINING SALE.—*National-Bulletin*: During the past two years ex-Recorder A. W. Cook has been making considerable money at his mine in Mohawk valley. Having made a comfortable sum, a few days ago he sold the property to Messrs. L. M. Christie aud B. A. Turner, who will operate it hereafter.

MINE SOLD.—*National-Rulletin*, Aug. 17: The Centennial mine and mill, in Genesee valley, have been sold to Messrs. Stewart and Dean, of Reno. We understands that the price is $8000, and that the purchasers inteud to put into the mill a full outfit for concentrating purposes. Considerable development work has been done on the property.

FROM JAMISON. — *National-Bulletin*: From Sam W. Cheyney, snperiutendent of the Jamison mine, we learn that 30 men are employed at the Jamison mine, and that work is beiug pushed. They now have a fair prospect in the mine. This mine ie located in a gold country —in close proximity to the famous Plumas-Eureka property which, in past years, has produced millions. Development work in the Jamisou is being prosecuted systematically and economically. Should the company conclude to erect a mill, they will have a most excelleut water power with which to operate it.

Shasta.

HYDRAULIC REVIVAL.—*Courier*: Ontside capital may inangnrate a move that will lead to a revival of hydraulic mining iu western Shasta. There are some good properties in that section which have lain idle for a uumber of years, owing to injnnctious being placed upon them by blackmailing schemers. The Harvey mine at Igo was one of the victims.

LEAGED TO AN OREGON SYNDICATE.—Redding *Free Press*, Aug. 19: During the two weeks' trip of iuspection in northwestern Shasta and northeastern Trinity counties, C. E. Brown, E. M., gleaned the following news: Spring Creek district.—The Minnesota claim is to be leased to au Oregon syndicate. A reduction plant is to be placed in the present mill building, which is already equipped with an excellent water-power. French Gulch district.—Considerable activity in prospecting exists. Messrs. Baker, Osborne, the Webb's, the Lowdou's and many others are in the field. J. W. Conant is placing a steam milling plant ou the American mine, and expects to commence redncing ore from two distinct veius which he expects will yield well. Trinity Center district.—A reliable inquiry for gravel exists. Numbers of men of practical experience in other parts of the State have been inepecting the gravel channel between Minersville and Coffee creek. Carrville district.—Parties spoken of above have been inspecting the Nash, Blythe and Carr gronps of gravel claims and mines, and their reports are very favorable as to yield, extent and facilities. The Oro Grande qnartz mine, owned by J. S. Strode & Bro., continues to improve upou development, and the mill is prodncing amalgam at a rate which is very gratifying to the owners. Miniug engineers and experts pronounce it the coming mine of the district.

Siskiyou.

THE SPENORR.—Ashland (Or.) *Tidings*: J. M. Bacon, of Gold Hill, and a Mr. Oliver, of San Francisco, are inspecting the old Spencer mine on Humbug in Siskiyou county, Cal. The mine has a narrow ledge of rich rock, but has been worked at a disadvantage in the past, and it ie proposed to run a long tunnel to drain the mine and reduce the cost of taking out the ore.

Trinity.

BIG CREW AT WORK.—Cor. *Advocate*: There has beeu a great stir in this and neighboring counties over the projected improvements on the now uoted Ward mine, recently purchased by a syndicate of Freuch and Colorado capitalists. The Coloradans and the French msan business. Three hundred men are busy on the ditch. The contractors are a little hampered by lack of tools, such as plows, scrapers, work animals, etc., but a supply is looked for any day uow. The operators are very much in earnest and the mine is now thoronghly opened. An extra good clean-up is anticipated, and the qnantity of gravel that has already been washed is simply immense.

NEVADA.

Washoe District.

TO MAKE A TEST.—Dispatch from Virginia, Aug. 16: The Crown Poiut mine was shut down to-night pending a test of 400 tons of gold-bearing ore recently extracted from the npper levels. Should the test prove satisfactory, operations will be resnmed. If otherwise, suspension of work in the mine will be permaneut.

CON. CAL. & VA. MINE.—Virginia *Chronicle*, August 19: 1500 level—The upraise started in the main south drift on the sill floor of this level, at a point 256 fest distant from the main shaft has been carried up 31 teet; totsl height 52 feet; continuing iu clay and quartz which shows a low assay value. 1600 level—Ths south drift started at the end of the east crosscut run from ths main south drift at a point where it connects with the upraise carried up to the north drift on the 1500 level has besn extended 15 feet; total lsngth, 104 feet; continuing in porphyry and qnartz of a very low assay valns. 1650 level—Have continued making necessary repairs to the drifts on the sill floor of this level; and from the two sides of the drift run east (at a poiut 20 feet down) from the winze sunk from the crosscut rnn west from the main northwest drift; and from the end of the drift (in working upward) run south from that wing at a point 52 feet down, we have extracted during the week 426 carloads of ore—about 420 tons, chiefly from the latter place. Have shipped to Morgan mill during the week 333 400-2000 tons of ore, the average assay value of which (per car samples) was $41.94 per ton. The average assay value (per battery samples) of all the ore worked at the mill duriug the week (380 tons) was $32.22 per ton.

OPHIR.—1565 level—The east crosscut started from the main drift on the sill floor of thie level, at a point 108 feet south from the winze station, has been advanced 16 feet; total length, 40 feet; in a hard porphyry formation.

MEXICAN.—On the 1565 level—The east crosscut from the north drift from the crosscut run east from the bottom of the winze, sunk from the 1465 level down to this level, near the south boundary line of the mine, has beeu extended 23 feet; total length, 202 feet, iu porphyry, clay and quartz.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has heen advauced during the week 16 feet, making the total length 543 feet; the face ie in porphyry. The joint Sierra Nevada and Union north drift from the west drift, 1520 feet west of the joint shaft, 900 level, is out a total distance of 72 feet; face in clay and porphyry.

UNION SHAFT.—The joint Sierra Nevada aud Union north drift from the west drift, 1520 feet west of the shaft, 900 level, ie out a total distance of 72 feet; face is in clay and porphyry.

ANDES.—On 420 level east crosscnt from main north lateral drift was advanced 13 feet; total length, 51 feet; face in qnartz and clay. This crosscut has connected with south drift from east crosscut No. 1 north.

GOULN & CURRY.—200 level—West crosscnt No. 5, started in northwest drift, 432 feet from main west drift, has been extended 15 feet; passing through porphyry and seams of clay; total length, 586 feet. North drift, started from west crosscut No. 5, 60 feet from northwest drift, has been advanced 12 feet and discontinued; total length 20 feet; face in quartz and porphyry.

BEST & BELCHER.—200 level—Started west crosscnt No. 3, in northwest drift, 295 feet from our south boundary, and extended same 16 feet, passing throngh soft porphyry and bnnches of quartz. 900 level—West crosscnt No. 5, started iu southwest drift, 100 feet from west crosscut No. 4, has been advanced 14 feet; total length, 76 feet; face in hard porphyry.

HALE & NORCROSS.—On 900 level the west crossut No. 1 from south drift was advanced 20 feet; total length, 52 feet; face in porphyry. 1100 level—Have advanced No. 1 west crosscut from the sonth drift on this level 20 feet; total length, 58 feet; face iu porphyry. In the early part of this week the night shift was dispensed with, and for the present work in this mine will be confined to the day time only.

CHOLLAE.—Have retimbered 50 feet the main tnnnel on 250 level dnring the past week. Have men on repairs in the main incline below the 930 level. The north drift from the west crosscut, 930 level, is out 43 feet; face is in porphyry.

POTOSI.—The east crosscut from the sonth drift, 220 feet south of the shaft, 850 level, is out 22 feet; face is in hard porphyry. The east drift, 73 feet above the 930 level, to connect with north raise from 930 level, is out 133 feet; face is in soft porphyry and streaks of quartz. Extracted and sent to the mill the past week 355 tons and 500 pounds of ore from the 930, 1000 and 1150 levels. Milled during the week 355 tons. On hand at mill 100 tons and 1750 pounds. Average battery assays, $29.69; average car-sample assays, $33.58. Shipped to the U. S. Mint, Carson, 376 pounds of crude bullion.

OCCIDENTAL.—Are extracting from five to six tons of ore per day from the 350 and 400 levels of the average assay value of $26 per ton, as per car samples.

KENTUCK.—Have extracted from the west ledge on the 1100 level about 20 tons of ore per day of the average value, as per car samples, of $7 per ton iu gold. The south drift from the joint east crosscut is in 33 feet; face in low-grade ore.

WARD SHAFT. — The west drift from the station, 820 level, is out 72 feet from the shaft; face is in porphyry.

BULLION.—The west drift from the station, 820 level, Ward shaft, is out 72 feet from the shaft; face is in porphyry.

EXCHEQUER.—The west drift from the station, 820 level, Ward shaft, is out 72 feet; facs is in porphyry.

ALPHA.—The west drift from the station, 820 level, Ward shaft, is out 72 feet from the shaft; face is in porphyry.

Silver Peak District.

INVESTIOATINO MINES.—Walker Lake *Bulletin*: A party of capitalists and miuing men are now at Silver Peak investigating the mines there with a view of purchasing. They are under the escort of Barney Gamble, and are said to bs amply able to buy and work the mines on a large scale.

Kennedy District.

TO BUILN A MILL.—Battle Mountain *Central Nevadan*: William Jenkins retnrned from Kennedy district last Monday, where he had been selecting a sight to build a mill which he proposes to erect immediately. This is something that Kennedy has long needed and which will prove of great benefit to the minsrs and also to the district.

ARIZONA.

EXPOSED FORTY FEET. — Prescott *Courier*, Aug. 19: Carr & Dempsey, owners of the new strike in Eugene gulch, have a body of ore exposed 40 feet iu width, from which several horn-spoon tests gave a result of $10 per ton in gold. This is not a ledge proper but an immense conglomerate blanket deposit, which gives good horn-spoon tests from any point. The Henrietta Gold Mining Company has about 50 men at work. The hoist is working splendidly, there is an abundance of water in the well, and sinking on the mine is going right along. A few days ago a man named Ed Rogers found a boulder two miles southwest of the Little Jessie mine which was literally filled with gold, the rock being worth not less than $500. It was a good-sized boulder. Mr. Rogers has not yet discovered the ledge from which the bonlder became detached.

A NEW GROUP OF MINES.—Prescott *Courier*: About one year ago J. H. Stevens commenced to prospect for a mine in the vicinity of Prescott, and he is now the owner of three gold claims eight miles from town, which he calls the St. Julian group. He is now working in the bottom of a shaft 12 feet in depth with a 14-inch vein exposed, which widene as depth is reached. The ore is full of gold, much of it coarse and visible to the naked eye, and assays from $40 to $500 per tou. He has valuable property which is said to belong to the same belt, and classed as the well-known Chaparral gulch properties. The miues are splendidly located, with pleuty of wood and water near by.

INQUIRINO FOR MINES.—Phœnix *Herald*: Attention of Colorado mining men is being attracted to the gold-fields of Arizoua. There is already some private inquiry for properties. The Harcnvar people are building a fine camp at Morgan City. They are located in a shallow, narrow basin within a stone-throw of the working of their mines. The principal work being done now is on the new mill, and when that is done there will be some lively work. McGinnis Bros. have some first-class gold locations on the same ledge which is furnishing the output for the Harcnvar mill being built at Morgan City. There conld be a chance to dispose of some of these properties it they were developed.

IDAHO.

WORK RESUMEN.—Salt Lake *Mining Journal*, Aug. 18: Work waeresnmed on the Star mine, at Hailey, Idaho, this morning, part of the force having gone up from this city last week. When work was suspended about six weeks ago the face of the crosscnt then being run wae just coming into veiu matter composed of clay and qnartz. Work at this point will be continned and the company expect to encounter a big ore body there very soon. A force has also been put to work jigging the secoud-class dump, composed of abcut 500 tons, some of which is very good ore. They expect to get 100 tons or more out of it of ore that will run at least 100 ounces per ton.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDINO AUG. 1, 1893.

502,648.—JEWEL GAOE—J. F. Adcox, Lebanon, Or.
502,267.—GRAIN BINDER—J. F. Appleby, Santa Cruz, Cal.
502,651. — FRUIT-CLEANER — J. L. Blockburger, Pasadena, Cal.
502,348.—EXPLODER FOR PROJECTILES—J. Clark, S. F.
502,410.—RATCHET WRENCH—W. H. Diedrick, S. F.
502,559.—PLANT PROTECTOR—B. F. Gilman, S. F.
502,416 — BITUMINOUS ROCK MACHINE — E. Groat, San Luis Obispo, Cal.
502,417.—BITUMINOUS ROCE MACHINE—E. Groat, San Luis Obispo, Cal.
502,624.—WATER-WHEEL REGULATOR—E. R. Holoomb, Portland, Or.
502,493.—BOOKBINDING—D. K. Howe, Portland, Or.
502,564.—TOOL-HOLDER—J. C. Hunter, S. F.
502,625.—STATION INDICATOR—H. G. Krasky, S. F.
502 568 —GANO PLANE—L. Kuctartz, Portland, Or.
502,628.—CHURN—R. A Ludlow, Globe, Cal.
502,570. — MOTION TRANSMITTER — W. H. Masterman, Oakland, Cal.
502,572.—BUSHING AND FAUCET—G. H. Merrick. S. F.
502,641. — LAWN SPRINKLER — Thos. Scheen, Oakland, Cal.
502,474.—CONDUIT—G. Sterling, Yakima, Wash.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special msution:

PLANE.—Louis Hardt, Yuba City, Cal. No. 502,906. Dated Ang. 8, 1893. This plane has for its objects the provision of an adjustable exposure of the bit-iron and a varying capacity of the throat. Thess objects are attained by means of the vertical and longitudinal adjnstments of the portion of the sole of the stock in advance of the maiu body portion and of the bit-iron, whereby the exposure of the cutting edge of the iron is increased or diminished, and simultaneously therewith the capacity of the throat is varied.

COMBINED INCUBATOR ANN BROODER.—James W. Atkinson, San Jose, Cal. No. 502,900. Dated Ang. 8, 1893. In this machine the npper portion of ths frame forms the brooding chamber and derives its necessary warmth from the heater of the incubator. Provision is mads for supplying ths brooding chamber with fresh, pure air, heated by contigoity with the top plate of the underlying heater. The foul air finds ready escape from the broodcer, which is thus perfectly vantilated and a circulation and constant sopply of pnre, fresh-heated air are maintained. The brooder is so located and constrncted as to permit the ready removal of the heater without dismembering the frame.

BICYCLE.—Henry S. Williams, Madera, Cal. No. 503,513 Dated Augnst 15, 1893. This machine is intended to be driven directly by the hands of the rider, whose feet rest on bearings so located that his legs serve as straining levers, whereby he is enabled to use the full power of his arms, back and legs to the best advantage. The frame of the machine is hinged in a vertical line about its middle. The saddle ie back of this line and the hand-gear and foot-rests are forward of it, so that the machine may be easily steered by the movements of both his hands and feet or of either.

SNAP-BUCKLE.—G. F. C. Schroter, Redding, Cal. No. 503,499. Dated Aug. 15, 1893. This device is a combined buckle and snap-hook. It is composed of an open frame or loop having the ends of its sides upwardly corved, with a top cross-bar, under and back of which is a second cross-bar. The opposite end of the frame serves ae a cross-bar and has projecting from it a slotted hooked bar with a spring-actuated tongue forming the snap. Two other cross-bars in different planes are betweeu the other bars, and upon these intervening bars are oppositely-exteuding tongues finding seats upon the bars adjacent to tbeir free ends. This device has few parts aud no projecting points.

Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition of R. M. Moser and J. O. Boyd for permission to mine by the hydraulic process at the Kelly Hill Gold Gravel Mining property, situated in Butte County, in sections 27 and 28, Township 23, N., Range 3, East, and to deposit tailings in Neshit and Brewer Gulches, which discharge into Big Butte Creek, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on August 29, 1893, at 1:30, P. M. On and before this hour and day all parties interested may file affidavits, plans and maps, in support of their respective claims. By order of the Commission; W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from N. O. Tully for permission to mine by the hydraulic process in the Omega Mining District, situated at the village of Omega, Washington Township, Nevada County, California, and to deposit tailings behind a dam in Scotchman's Creek, which discharges into the South Yuba River, and having also received a petition from Robert McMurray, attorney-in-fact for the Eureka Lake and Yuba Canal Company Consolidated, for permission to mine by the hydraulic process the Farrel mine, situated near Columbia Hill, Nevada County, California, and to deposit tailings behind a dam in an old hydraulic pit, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on September 4, 1893, at 1 o'clock P. M. On and before this hour and date, all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

Mining Property For Sale.

A Drift Gravel Mine of 250 Acres at Forest City, Sierra Co., Cal.

Blacksmith shop and tools, T-rails for 800 feet of tunnel, 500 feet tunnel completed. Mine incorporated. For particulars inquire of the undersigned at Forest City. **B. F. DERICKSON,**

Forest City, July 25, 1893.

THE RUSSELL PROCESS.

See Exhibit at World's Coinmbian Exposition, Chicago, Mining Building, Southwest Gallery, Location, Coinmn 25B.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope Isal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

Voltaic Mineral Rods.

Important to Miners and Treasure-Seekers. Send Stamp for Circular to E. A. COFFIN, No. 47 Bristol Street, Boston, Mass.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 24, 1893.

Lead has hung stationary for some time at about $3.30 to $3.40 per 100 pounds. The normal price of the metal, taking a long series of yearly and monthly averages for a guide, is somewhere about $5 per 100 pounds. From 1870 to 1879 the New York quotation was almost constantly above $6, though there were a few exceptional quotations made just under that line. From 1880 to 1884 it ranged between $4 and $5. In 1885 it fell as low as $3.65, but soon recovered. In the last few years the average has held at above $4, the range in 1892 having been $4.30 to $3.80, but with quotations for most of the year over $4. The strikes in the Cœur d'Alene silver-lead region of Idaho, by curtailing the supply, may have had some influence in upholding prices, but not very much. It should be remembered that under the present advanced methods of lead smelting for the precious metals much less lead is required and used in the furnace charge than was the custom formerly. The lead districts east of the silver-lead smelting country, like the lead mines of Missouri, Kansas, Wisconsin, etc., do not add to their former rate of production, and latterly the imports of silver-lead ore from Mexico have considerably fallen of. Whatever effect the chances of free silver-lead ores, or free metallic lead imports, might have has been long since discounted—being allowed for as long ago as the November elections of last year. On the other hand, the steadily increasing consumption is in favor of better prices, one important new demand being for lead pipe coverings to underground electric wires. At the beginning of the preseot year the stocks of lead at New York, Chicago and San Francisco were reported as unusually light. Since then they caonot have increased mucb.

Silver.

Silver has shown decided strength during the week both lo London and New York. The advance in London Tuesday was 1¼d, and in New Ynrk the galn has beeo 3½ cents for the week.

Trade In Quicksilver.

The receipts of quicksilver at this port during July and for the first seveo months of the present year compare with preceding years as follows:

	For. July.	Jan. 1 to July 31.
1891, flasks	1,289	8,333
1892	1,539	11,216
1893	1,638	14,513

Exports by sea from San Francisco during last month were 1081 flasks, including 750 to New York, 169 to Mexico, 112 to Central America, and 50 to Australia. Exports hy sea for the first seven months of the year were as follows:

	Flasks.	Value.
New York	6,450	$261,050
Australia	650	26,825
New Zealand	67	2,649
Central America	284	11,386
Mexico	2,603	108,378
British Columbia	6	236
Canada	280	11,200
Totals	10,340	$421,751
In 1892	5,546	230,235

The shipments overland in the first six mnnths of the year were 4632 flasks.

The Coinage for July.

The several Mints of the United Slates coined during the month of July all the styles of coin known to the American system except four. The aggregate coinage for the month and since January 1, 1893, was as follows:

	For July.	Jan. 1 to July 31.
Double Eagles	$10,000	$10,298,760
Eagles	220,000	4,952,220
Half Eagles	15,000	1,390,120
Quarter Eagles	75,000	75,132
Standard Dollars	.....	1,455,465
Half Dollars	.....	535,733
Half (Columbian) Dols.	.....	2,026,052
Quarter Dollars	33,000	1,558,550
Quarter (Columb'n) Dols	.....	10,006
Dimes	.....	470,046
Five Ceots	23,000	380,463
Cents	15,000	281,213
Totals	$391,900	$23,433,760
Io 1892	2,018,000	29,814,402

Mining Share Market.

SAN FRANCISCO, August 24, 1893.

After a quiet week lo the stock market Comstocks opened up much improved Monday morning. Much higher car and battery assays of ore taken from the Consolidated California and Virginia and Potosi mines last week counteracted the effect of the news that the Comstock miners and mechanics had refused to accept any reduction in their wages. The improvement has continued through the week, and yesterday sales were the largest for some time. During yesterday forenoon Consolidated California and Virginia sold at as high as $1.40, Ophir 70 cents and Potosi 65 cents, with proportionate gains in the others. Afterward, when certain holders tried to secure the small profits that were lo sight, the market became weaker and closed at a decline of 5 to 10 cents. The miners' uotoos of Virginia City and Gnld Hill will hold a meeting to-night, at which the wages question will again be taken up. H. M. Yerington, president of the Virgioia & Truckee railroad, has beeo invited to meet the miners, and he will do so although he may not attend the meeting.

The miners are said to he willing to accept a reduction of 50 ceots per day io their wages, which would bring them dowo to $3.50, if they have assurance that the rates for wood, lumber, water, transportation and the salaries of officials bave also beeo reduced to the extent agreed upon. It is likely that an offer from them to work for $3.50 per day will be accepted.

The application of the Granite Hill Gold-Mining Compaoy for listing at the San Fraocisco Stock and Exchange Board has been favorably reported on, and the stock has beeo placed upoo the regular list.

The Teirakoff Mining Company of Amador county has levied ao assessment of one ceot per share, delinquent September 28th.

The application of the Gray Eagle gold mine for listing at tbe Sao Francisco Stock aod Exchange Board has beeo favorably reported upon, aod its shares are now on the regular list.

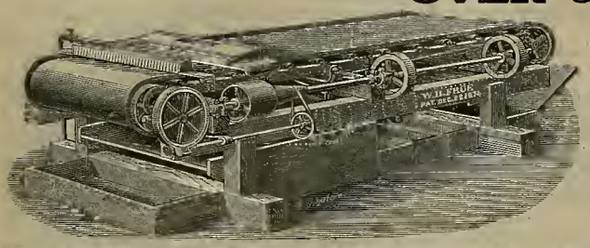
FRUE ORE CONCENTRATOR

OVER 8200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been ton small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner.....$550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

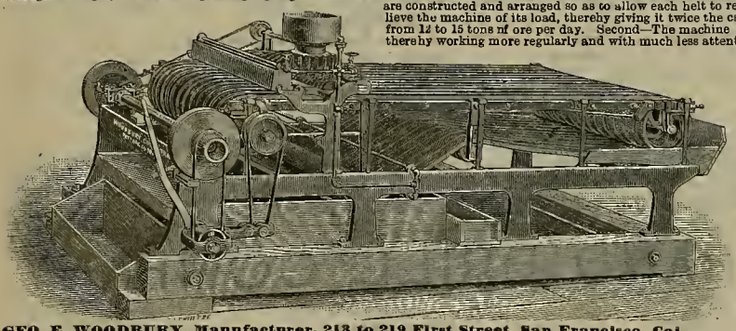
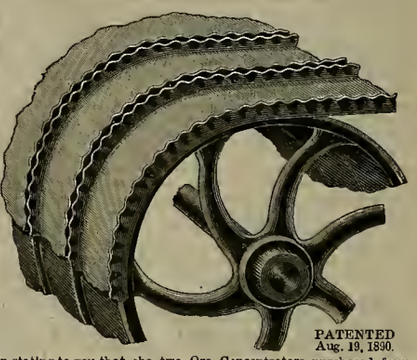
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by having several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allotted to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.





PATENTED Aug. 19, 1890.

[COPY.]

Eureka Tellurium Gold Mining Company, Redding, Cal., July, 21, 1893.—Mr. Geo. E. Woodbury, 213 First St., San Francisco, Cal.—Dear Sir:—We take pleasure in stating to you that the two Ore Concentrators purchased from you last April are giving perfect satisfaction. They are simple, durable and effective, and we hereby conscientiously recommend the "Woodbury" pattern to all intending purchasers of Ore Concentrators. Yours truly,

[Signed] EUREKA TELLURIUM GOLD MINING CO., by GEO. O. JONES, Secretary.

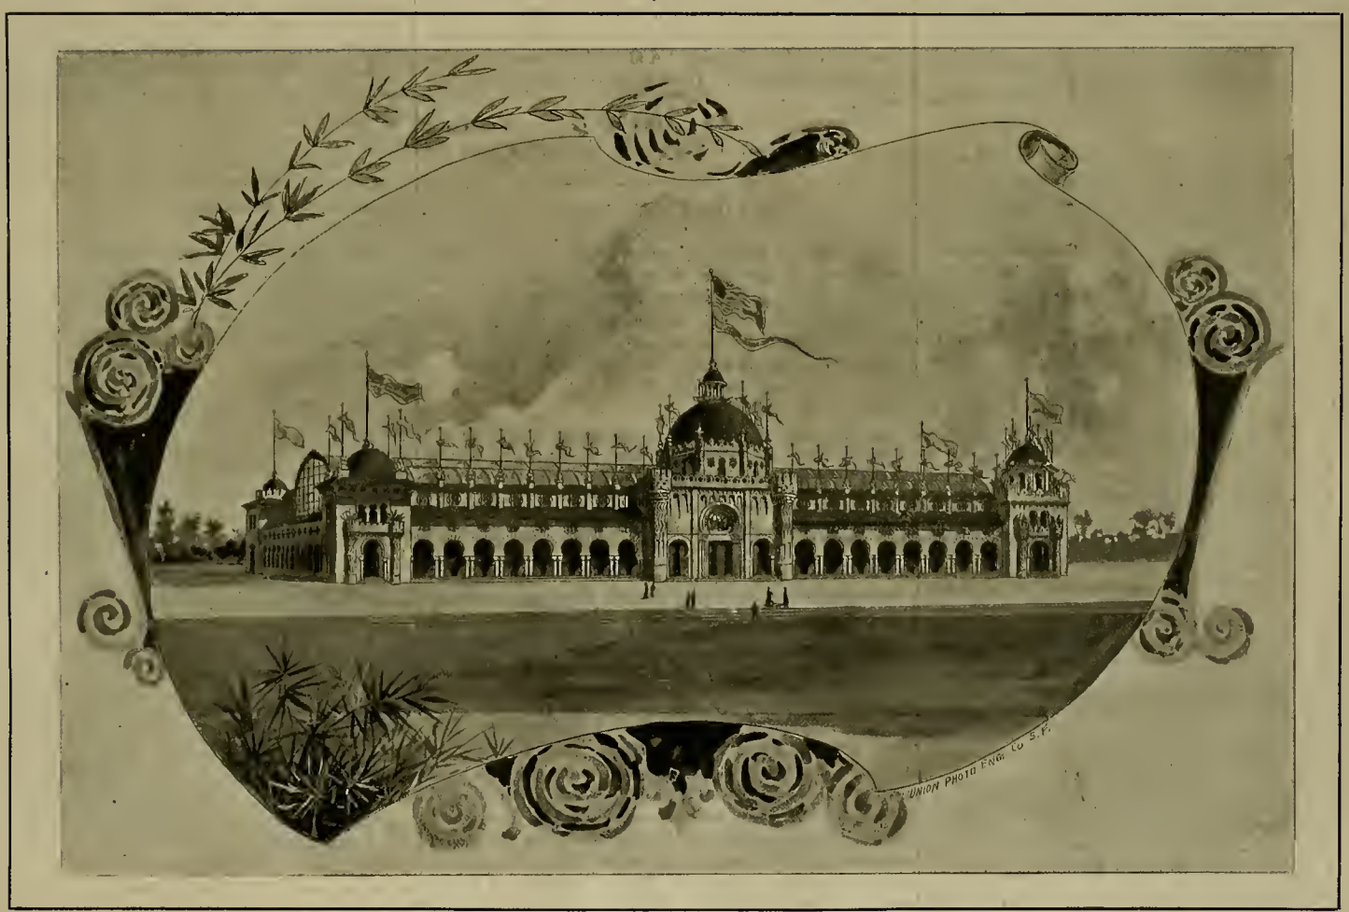
The Midwinter Fair.

Ground was broken last week for the Midwinter Fair, the occasion being marked by appropriate exercises and by tremendous attendance on the part of the people of of San Francisco and neighboring cities. The credit and good name of the city are now pledged before the world to make the fair a success, and there appears to be no donbt that every possible effort in that direction will be made. The arrangements of the management are being made on an elaborate scale, and enough money has been subscribed to afford a sufficient guaranty that the fair is a "go." Too much cannot be said of the desirability and importance of the enterprise. Expressions from coast cities have been of a most encouraging nature; and have shown that interest and sympathy have been excited among people of all classes. The East, too, looks on the project with an approving eye, and promises to send large numbers of visitors across the continent to visit the exhibition and incidentally to enjoy the charms of climate and scenery California will extend them. Intending exhibitors have applied for space in such large numbers that the management is already confronted with a serious question as to what shall be done to accommodate all.

It is proposed to erect five buildings in Golden Gate Park. The plans of four have already been chosen from a competitive display of architects' drawings. The illustration on this page is of the Manufactures and Liberal Arts building, reproduced from the first number of the *California Midwinter International Exposition Illustrated*, the authentic journal of the fair. It is the largest of the five structures and was designed by Mr. A. Page Brown, who was the architect of California's attractive building at Chicago. It is of Moorish design, 450 feet long and 250 feet wide, its height being 55 feet. It has all the picturesqueness that is so readily obtainable in this style of architecture, and with the collonade which surrounds it, and its towers, will introduce the various forms so popular in the mission buildings. Roof gardens will be found in the loggias of the towers. The roof will be covered with curled metal tiles, and a skylight, and the building will be lighted as well from the sides. The building will be constructed of wood, plaster and cement. The exterior will be a creamy white, with the red roof in striking contrast, and in the corridors more glowing colors will be introduced. The estimated cost of the building complete is $105,000.



MANUFACTURES AND LIBERAL ARTS BUILDING OF THE MIDWINTER FAIR.

The opinion is general among those best acquainted with legislation that no change in the essence of the Caminetti law will be made until its provisions have been thoroughly tested and it is satisfactorily demonstrated that it will or will not accomplish the objects for which it was enacted. There may be some corrective legislation, but probably none that is vital or of very great importance. In view of these circumstances, it seems to us that miners should make the best of the situation and start idle mines wherever practicable. It may be true that hydraulic mining will be more expensive than before; but it is also true that gold is actually worth more than it has ever been. The profits of hydraulicking will be less than under former conditions; but there is no important branch of business that does not run on closer margins than ever before. California badly needs the output of the hydraulic mines. They can immensely swell the permanent wealth of the State. They can give employment to many idle men. If it is possible to obtain a license to mine under the law it should by all means be done.

Senator Sherman is no friend of silver, but he is nevertheless placed in the attitude of defending the Sherman silver-purchase law. He frankly declares that the heavy silver purchases by the Government are not responsible for the present monetary evils. But the real cause is the fact that England required us to pay our debts in gold when the balance of trade was against us. Further, when England was so badly bitten in the Argentine Republic smash-up, she called in her American securities and required payment in gold in order to maintain her own institutions. All of which goes to show that silver did not drive gold from the United States.

Secretary Carlisle has ordered that the United States mints at Philadelphia and San Francisco be fully manned and that the full capacity of both mints be utilized in the coinage of gold bullion. The Treasury Department possesses from $85,000,000 to $90,000,000 in gold bullion, which is part of the gold reserve of $100,000,000. Gold bars cannot be used as currency, so it has been decided in the time of the present need to coin the bullion,

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 159.

WHAT is meant by the gold and silver ratio of 16 to 1? is a question frequently asked. The legal silver dollar consists of 412.5 grains standard silver, the legal gold dollar 25.8 grains standard gold. Both are nine-tenths pure, one-tenth alloy. The silver dollar therefore contains 371.25 (412.5 minus 41.25) grains pure silver, 41.25 grains alloy. The gold dollar contains 23.22 (25.8 minus 2 58) grains pure gold. The weight of silver in one dollar is therefore 15 98 times the weight of gold, or, practically, 16 times the weight of gold. Nominally, 16 ounces of silver and 1 ounce of gold are of the same value. At the ratio of 20 to 1 the silver dollar would contain 464.40 grains of pure silver, or 516 grains of standard silver, and be twenty times the weight of the gold dollar, and silver, when coined, would be worth $1.03 per ounce, or over 26 cents per ounce less than its present value.

FOLLOWING is the vote of the California delegation in the House, last Monday, on the several financial propositions under consideration in connection with repeal of the Sherman law:

On a ratio of 16 to 1: Ayes—Bowers, Cannon, Caminetti, Geary and Maguire. Noes—Hilborn and Lond.

On a ratio of 17 to 1: Ayes—Bowers and Caminetti. Noes—Geary, Hilborn, Lond and Maguire. Cannon not voting.

On the ratio of 18 to 1: Ayes—Bowers, Caminetti, Cannon and Hilborn. Noes—Geary, Loud and Maguire.

On a ratio of 19 to 1: Ayes—Bowers, Caminetti, Cannon, Hilborn. Noes—Geary and Lond. Maguire not voting.

On a ratio of 20 to 1: Ayes—Bowers, Caminetti, Cannon and Hilborn. Noes—Geary, Lond and Magnire.

On the Bland-Allison Act restoration: Ayes—Bowers, Caminetti, Cannon, Hilborn and Maguire. Noes—Geary and Loud.

On the Wilson bill: Ayes—Cannon and Geary. Noes—Bowers, Caminetti, Hilborn, Lond and Maguire.

AUSTIN, Nevada, has a Woman's Silver League which takes an active interest in public affairs and is, of course, for unlimited coinage of silver. Strong silver resolutions were recently passed, and copies sent to Nevada's representatives in Congress, to Mrs. Cleveland and others. Mrs. J. A. Miller is president, Miss Mary Egan secretary of the league, and the resolution committee is Mrs. J. R. Williamson, Mrs. O. J. Clifford, Mrs. Wm. Foster, Mrs. W. J. McGlew, Mrs. Thos. H. Dalton, Miss Katie Laughlin, Mrs. Wm. Easton.

IT is reported that a syndicate composed of J. B. Haggin, John W. Mackay and Senator Jones of Nevada has about concluded arrangements for the purchase of all the gold mines and interests in the Beauce mining district in the province of Quebec. These mines are located about 75 miles north of the city of Quebec, and are known as the Gilbert river gold mines.

THERE is a prospect that the differences as to wages between the owners and employes of the big Bunker Hill & Sullivan mine, at Wardner, Idaho, will be adjusted, and the miners will go to work at a reduced scale.

Silver Not Yet Beaten.

The lower house of Congress last Monday passed the Wilson repeal bill by a vote of 240 to 110, after a debate lasting over two weeks and a determined and spirited fight by the silver men. It was evident from the first that the majority was against them and that they were marching into the teeth of defeat. But they went down with banners flying.

The result can scarcely be said to be either a surprise or a disappointment to the friends of free coinage, as it had been fully realized that they were in a minority in the House. The real test of strength was not to be made there. The action of the Senate, and not the House, will determine the fate of silver. While the large adverse vote of the House will have little or no direct influence on the Senate, it ought to be said that it is an indication that the administration is more powerful than either friends or foes of silver had anticipated. All the power of patronage and promise of spoil was brought to bear upon susceptible members, and all the disadvantage and loss of influence certain to accrue from the assumption of an attitude hostile to the President and his monometallistic allies had their effect with others. The mass of indifferent, doubtful and timid members was therefore arrayed for the Wilson bill, and only the outspoken champions of silver were left against it.

There can be no doubt that the same stealthy influences will be brought to bear on the Senate by the administration, and it is not wise to underestimate their effect. At the same time, silver is unquestionably stronger in the Senate, and has more numerous, able and powerful friends. If the silver men cannot defeat the Wilson bill (or its substitute, the Voorhees bill), there is a strong chance that they may be able to load it with amendments or effect some sort of a compromise. A silver bill passed the Senate at the last session. There is no little prestige in that record.

The battle is not ended. The administration has not yet won. The broken blade only makes the fight the closer.

The Old Fight Again.

It is without doubt the purpose of the Anti-Debris Association to resist the resumption of work by such hydraulic mines as were closed down under the Sawyer decision. Their attorney, R. T. Devlin, makes a covert threat that if any such mines are allowed by the Commission to resume operations, an attempt will be made to bring the constitutionality of the Caminetti law into question. Says Mr. Devlin:

> Our association is not opposed to hydranlic mining in the abstract. We merely desire to protect our own interests. If the Commission protects ns from injnry we have no objection to offer, bnt if their precautions are insnfficient we will contend for the protection laid down as onrs by right under the Sawyer decision. We do not claim any right to go contrary to any Act of Congress, but we also claim that Congress has no right to grant privileges to one class to injure another. That is a fundamental right gnaranteed ns by the Constitntion. I understand that petitions will be filed to operate mines enjoined under the Sawyer Act and under the ssme conditions. Such petitions we will resist before the Commission and elsewhere if necessary. Good faith is an element in this matter. The Commission may lay down good and snfficient regulations which may be violated. We must see that the regnlations are snfficient and then see that they are observed.

The association is not opposed to hydraulic mining in the abstract, but it is in the concrete. That is what Mr. Devlin means to say. An attempt is to be made to open up the whole question anew by protest against the application of the Omega mine, Nevada county. The Anti-Debris Association has already placed itself on record as declaring that impounding works will not impondd, and, inferentially, that the Debris Commission is not under the law able to devise any system of protection that will protect. It doubts the engineering skill of the Commission. It has taken snap judgment on the law before its workings have been tried. The fact is, that the anti-debris people have made up their minds to be dissatisfied with any requirement of the Commission allowing mining to be resumed. In the judgment of the self-styled representatives of the valley interests, the truly ideal condition under which hydraulic mines might be resumed would be a general requirement that no water be used.

As to Impounding Dams.

It is already apparent that some features of the Caminetti law can be revised without altering its spirit or intent. For instance, it appears to have been decided by the Debris Commission that for the present all licensees are to be required to erect restraining dams whether needed or not. In many cases, the location of mines is such that no adverse interests are affected in the dumping of the debris. The Kelly Hill Gold Gravel Company, which will doubtless be granted permission to mine, must erect a dam in Nesbit canyon. The dam is said to be a superfluity, but the expense must nevertheless be incurred.

The Debris Commission should be expressly vested with discretion in the matter of requiring erection of dams. As it is now, the law does not in words and terms require that such works shall in all cases be provided. It makes general provision for impounding the debris by government works at the head of navigable streams; but such reservoirs are not erected, and it may be some time before appropriation is made therefor. In other cases, it is provided, before the grant of the license, that the Commission shall "make an order directing the methods and specifying in detail the manner in which operations shall proceed in such mine or mines; what restraining or impounding works, *if facilities therefor can be found*, shall be built and maintained, etc." If facilities cannot be found, the construction of law by the Commission seems to be that the debris must be impounded in the government works; and, if there are no such works, and no facilities are found, license shall not be granted. At any rate, it is deemed wise by the Commission to be on the safe side. It is certainly within its prerogative to require impounding works. It may not be to allow mining in certain cases without such works.

IT is probable that the Senate, in the discussion over unconditional repeal of the purchase clause of the Sherman Act, will attempt to substitute for the Wilson bill another measure by Senator Voorhees, Chairman of the Finance Committee. The Voorhees bill repeals the purchase clause, but contains a pledge for bimetallism, declaring it to be the policy of the United States to continue the use of both gold and silver as standard money and to maintain their parity. The equality is to be secured through international agreement or by other legislation. There is no substantial difference between the Wilson and Voorhees bills. The bimetallic declaration of the latter amounts to nothing and is not binding upon anybody or anything. It means just as much as the pretty double-standard utterances of the Chicago and Minneapolis platforms, which seem to have been designed for use before election only.

CHARLES WARD, a prospector, puts forward the interesting, if not convincing, claim that the great Mother Lode extends south through Fresno county and even to a greater distance in that direction. Mr. Ward says that he has traced the formation four miles in what is now Madera county, making seven locations. These locations have been developed and other openings have been made until now there are some 16 workings on the Mother Lode in the vicinity of Grub Gulch, 14 miles from the Raymond Railway branch. Mr. Ward shows specimens of the rock from these workings that illustrate the character of the mineral deposit. The lode is capped, he says, with an unfavorable-looking sugary quartz, which merges gradually into a fine and rich gold-bearing rock, bearing the precious metal in particles large enough to be visible with the naked eye. The vein, he states, is from 5 to 35 feet in width, and has improved in quality in every shaft as it deepens.

THE gold mines of Nevada county are attracting renewed attention, and the activity of that section is more marked than for a number of years. Nevada City and Grass Valley show more life than most towns in the State of the same population; and the various mining camps have assumed an air of spirit and prosperity that argues well for the future. The hills are full of prospectors, new mining enterprises are being undertaken, idle mines revived, and the days of old and the days of gold appear to have returned in earnest. Better than all, the old reliable mines continue right along in business at the old stand and declare dividends with unfailing regularity. Nevada seems destined to continue in the lead of gold-producing counties of the State. May its namesake soon find also that the silver clouds have a gold lining!

JAMES LEFFEL & Co., Springfield, Ohio, are the manufacturers of the turbine wheel to be used at Niagara Falls, described at length in the PRESS two weeks since. Through inadvertance the name of the makers was omitted. The performance of the wheel was so satisfactory that Messrs. Leffel & Co. have been directed to make an exact duplicate of 1100-horse power. Shipment will be made soon and the application of horse-power made at once.

FOLLOWING the defeat of silver in the House the Carson *Appeal* calls for the impeachment of the President for bribing Congress with promises of patronage, and closes a bitter editorial by saying: "The Goddess of Liberty, which has been farmed out to the highest bidder for years, has now fallen so low that she has become the common strumpet of Wall street."

The First Application.

The public hearing on the first application for license to mine by the hydraulic process under the Caminetti law was held by the California Debris Commission in this city Tuesday, August 29th. State Commissioner Kidder was present and sat with the Federal board. The applicants were Messrs. R. M. Mooer and J. C. Boyd of Butte county. The public proceedings were very brief and hardly gave a sufficient indication of the real importance of tbe occasion, wbich was a part of the first formal step by miners toward tbe resumption of hydraulic mining in the State. The applicants were present in person and by attorney, W. M. Pierson, and the Anti-Debris Association was present by its attorney, R. T. Devlin, and by a prominent member, Geo. Obleyer. Tbe anti-debris people were simply on hand in conformance with their well-known policy of watching tbings and to learn in just wbat manner and under what auspices the law was to be put in operation.

Lieut. Col. Benyuard briefly stated the purpose of the session, and the following documents were read by the secretary, Major Heuer. They are given in full for the purpose of indicating in what manner tbe rules and requirements of the debris commission in making applications are to be complied with:

SAN FRANCISCO, July 21, 1893.

Major W. H. Heuer, Hydraulic Commissioner.—DEAR SIR:—In accordance with tbe instructions set forth in your circular for a permit to erect and operate a hydraulic property, we beg leave to submit the following for your and your associates' approval, believing that we have fully set forth and explained in a clear and comprehensive manner, questions propounded or set forth in your circular. Hoping they may prove satisfactory, we most respectfully ask you to grant us, at your earliest convenience, a permit to erect and operate a hydraulic on the Kelly Hill Gold Gravel Mining property.

Yours very respectfully,
R. M. MOOER.
J. C. BOYD.

KELLY HILL GOLD GRAVEL MINE.

The Kelly Hill Gold Gravel Mining property is situated between the towns of Centerville and Nimshew, distant by a good road about 17 miles in a northeasterly direction from the town of Chico, and about 210 miles from the city of San Francisco.

The property is located in Centerville and Helltown Mining District, in sections 27 and 28, township 23 north, range 3 east, Mount Diablo meridian.

The ground to be worked by hydraulic is 1600 feet in length, average width of 250 feet, and average depth of about 75 feet; fall from upper end of ground to be worked to Big Butte creek, 1100 feet; fall from point where work will be commenced to Big Butte creek, about 700 feet.

The average width of Nesbit gulch to be used as dump, 800 feet; average depth of Nesbit gulch, as dumping ground, 75 feet; length of Nesbit gulch from point of commencement of work to where it empties into Big Butte is about 5000 feet.

The average width of Brewer gulch to be used as dump, 1000 feet; average depth of Brewer gulch as dumping ground, 75 feet; length of Brewer gulch from upper end of dump to where it intersects with Big Butte creek is over 5000 feet; size pipe to be used to convey water from pen-stock to monitor, will be 15-inch, 18-inch and 20-inch; fall or pressure of water, from pen-stock to monitor, about 330 feet; the quantity of water to be used, 500 inches; drainage of water will be into Neshit and Brewer gulches, thence into Big Butte creek. Character of gravel to be worked consists mostly of what is termed as flat wash and ancient channel wash. Source of water supply will be taken from Spring Valley ditch, which is taken from Big Butte creek. Size of ditch, four feet wide on top, two feet on bottom, two and one-half feet deep. Length of mining season 12 months in the year. Ground to be worked 20 hours daily when not interrupted by inclement weather or breakdowns. Grade of sluices, one inch to one foot; size of sluices, three feet wide, two feet deep; amount of ground to be washed per hour will be from 8 to 12 cubic yards, which will be owing to the compactness of the ground. Should cemented ground be encountered much less ground would be washed per 24 hours.

Either the Neshit or Brewer gulches has ample dumpage facilities for holding double the amount of debris contained in the ground proposed to be worked off by hydraulic, none of which will enter Big Butte creek. There is the best of facilities for erecting restraining dams of rock, should they ever be required.

The map accompanying this report will fully show the situation and size of the ground to be worked by hydraulic; also the gulches to be used as dumping ground and their outlets into Big Butte creek, location of buildings, etc., etc.

To reach the Kelly Hill mining property take the Oakland boat at either 8 o'clock A. M., or 7 o'clock P. M. for Chico, distant from San Francisco to Chico by Oregon railroad 193 miles; from Chico to Kelly Hill, either by stage or private conveyance, 17 miles. Stages leave Chico on Sundays, Tuesdays and Thursdays.

Hoping the foregoing description of the property and the plan for fitting it up for active hydraulic operations, and the great advantage for dumps and impounding of tailings, will fully meet your views, for granting us a permit for working the same by hydraulic process.

Yours very respectfully,
R. M. MOOER.
J. C. BOYD.

THE SURRENDER.

To the Honorable the California Debris Commission:

The petition of R. M. Mooer and S. C. Boyd, residents of the State of California, respectfully shows:

That they are the proprietors of those certain hydraulic mining claims known as the Warren mining claim and the Fricker mining claim, situated in the Helltown and Centerville Mining District, Butte County, State of California, and originally known as the Kelly Hill Gold Gravel Mining property, situated in sections 27 and 28, township 23 north, range 3 East, Mount Diablo meridian.

That they are desirous of working said claim by the hydraulic process.

That they hereby surrender to the United States the right and privilege of regulating by law, as provided for in the Act of Congress approved March 1, 1893, or any law that may hereafter be enacted, or by such rules and regulations as may be prescribed by virtue thereof, the manner and method in which the debris resulting from the working of said mines shall be restrained, and what amount shall be reproduced therefrom.

It is understood, however, that the surrender, as aforesaid, shall not be construed as in any way as affecting the right of such owners to operate said mines by any other process or method now in use in said State, provided, however, that said proprietors shall not interfere with the navigability of any of the rivers mentioned in said Act of Congress.

IN WITNESS WHEREOF, your petitioners have hereunto set their hands and seals this 4th day of August, 1893.
R. M. MOORE.
J. C. BOYD.

When these documents had been read, Col. Benyuard asked if there were any others who wished to be heard for or against the grant of the petition. Attorney Devlin announced that the Anti-Debris Association had no objections to offer, but that two applications for license were to be heard next week to one of which the Anti-Debris Association would make formal objection.

He wanted to know when the necessary papers should be filed, and was informed that they must be handed in previous to the hearing. It is understood that a fight will be made on the application of N. C. Tully for permission to mine in the Omega Mining District, Washington township, Nevada county. The mine had been shut down by order of the court.

This closed the public hearing. The Commission afterward met with Messrs. Mooer and Boyd and inquired particularly of their plans, intentions, etc. The applicants were directed to prepare plans for a restraining dam and submit to the Commission. If the plans are approved, license to mine will be granted in due form.

ARIZONA shares in a large degree the general activity that has recently marked gold mining enterprises. Time was when no prospector would trouble himself with a ledge of gold-bearing quartz that assayed less than an ounce to the ton on the surface. Silver mining offered greater inducements. But things are changed. Neglected prospects are now being developed, and in many places paying ore bodies have been opened up. The gold output of Arizona will no doubt be heavily increased in future, and it is not too much to anticipate that its value will in time exceed the loss from the depreciation of silver. One trouble with Arizona is that it has been too modest about its own fine resources and has not sufficiently counteracted a general impression in the East that its chief products are cacti and cowboys. When the cheap humorist who is circulating the Arizona *Kicker* fiction dies, or he is otherwise providentially incapacitated from libeling a progressive, honest and honorable people by further publication of his malicious nonsense, Arizona will have a chance to be known for what it is really worth.

THE MINING AND SCIENTIFIC PRESS this week contains the full text of Admiral Selwyn's Zymean process of ore reduction, with a full review by the editor of this paper. We conceive it to be our duty to tell the truth about any project or process having for its object the welfare of the miner; and it is no less our duty to expose fallacies and correct errors of schemes which wrongfully pretend to open a new, easy and economical way of ore reduction. The task in this instance has been especially unpleasant, inasmuch as Admiral Selwyn is a gentleman of high character, undoubted integrity and honest purpose; and he thoroughly believes in the practicability of his method of ore reduction. If it were feasible, we should bail it with satisfaction and do all in our power to present it properly and fully to the miners. But it is not practicable, and we have endeavored to show clearly wherein and why it is not.

ACCORDING to a recent dispatch, Baker City, Or., has just received from Sloan & Haskell's diggings one gold nugget weighing $375, and a number worth over $100. The output amounts to $5000, the result of 30 days' run. The ground worked was 65 feet wide and 145 feet long, the average depth being 15 feet.

Foundry Notes.

THE Union Iron Works is preparing a twenty-stamp mill for a mine in Sierra county.

THE Government steamers McArthur and McDowell are undergoing repairs at the wharf of the Fulton Iron Works.

THE Union Iron Works has shipped to Nevada county machinery for a new mill for the Champion Mining Company. The plant weighs 22 tons.

THE foundries are engaged largely in repair work and the general run of smaller orders. Hard times are complained of, but there is nevertheless a fair amount of activity among them.

THE California Wire Works have just finished a 1¼-inch cable for use on the Oak-street branch of the Omnibus Cable Company's system. Its length is 14,240 feet, and its weight 36,474 pounds, or over 18 tons.

THE Spring Valley Water Works has placed an order with the Fulton Iron Works for a large pumping plant, supplementary to its present system. Its capacity will be 3,000,000 gallons in 24 hours under 400-foot head; weight, 200 tons.

THE Fulton Iron Works is engaged in filling two orders for mining machinery, destined for Mexico. One is for a hoist, dry crushing mill, and leaching plant; the other a hoist with boiler, air receiver and general mining plant. Work is also going forward on a water-power hoist and pumps for a mine near Chico.

THE Union Iron Works is putting the finishing touches on the big cruiser Olympia. Steam was gotten up last Monday and the cruiser moved for the first time by the impetus of her own machinery. She steamed ahead and then astern as far as the play of her hawser would permit. These little pendulum trips were continued for some time. Tuesday and Wednesday the cruiser steamed around the bay, and every part of her machinery was thoroughly tried. The tests were private. The official trip will no doubt be made within the next few weeks.

Tailings.

THE steamer Bertha last week brought down $65,000 in dust and nuggets from the Alaska mines.

MATTHEW RAPSON AND THOMAS JENKINS, miners well known on tha Comstock, died last week, both of miners' consumption.

FOUR million dollars in gold coin have just been shipped by Superintendent Daggett from the United States Mint in this city to New York.

HAYWARD A. HARVEY, inventor of the Harveyized steel armor plates and roller screw, died at Orange, N. J., Monday, from kidney trouble.

THE Idaho mine, Nevada county, has declared another dividend, the amount being $2 per share on the capital stock. This makes 276 dividends paid by that mina.

WORK on the rich Bassick mine in Colorado was suddenly stopped recently by the discovery of a human skeleton 600 feet below the surface. The terrified miners believed the place to he haunted.

THE Amador *Dispatch* has concluded its thirty-fourth volume, and contemplates extensive improvemants. The *Dispatch* grows better as it grows older, and seems destined for a long career of usefulness.

E. G. SMITH, of Auburn, well known in mining circles, is in the city on his way to Seward City, Alaska, where he is to be employed by the Nowell Gold Mining Company. Mr. Smith is 72 years old, but he intends to grow up with the country, just the same.

AT a meeting of miners held at Redding, tha following telegraphic memorial was ordered sent to Congressman Geary at Washington: "We respectfully request that you use your best endeavors to rehabilitate silver as money before the repeal of the Sherman act."

THE Empress of India Mining Company has been incorporated at Spenceville, Nevada county. The capital stock is $1,000,000, all of which has been subscribed. Directors—I. L. Hoffman, M. Sondheimer, Emil Woenne, Chas. Pietsch, C. C. Bitner, Meyer Rosenthal and I. L. Rosenthal.

THE Eastern Star G. and S. M. Co. have filed articles of incorporation in Nevada county. The directors are: Frank E. Dennen, Elam Biggs, Geo. Vincent, D. N. Coffin and P. H. Paynter, all of Grass Valley. The capital stock is $1,000,000, divided into 100,000 shares at the par value of $10 each.

ALASKA is getting out a good deal of gold this year. There are 300 or 400 miners on the Yukon, or rather on its branches, Forty-mile creek and Sixty-mile creek. A trading post has been established at Forty-mile, so that it is no longer necessary for miners to freight their supplies up on sleds.

ARTICLES OF INCORPORATION of the Kate Hayes Hill Mining and Milling Company have been filed with the Nevada county clerk. Principal place of business, Grass Valley. Directors—John F. Cooper, W. M. Treloar, W. Macdonald Blair, John C. Roberts, W. E. Parsons. Capital stock, $100,000.

THE Diamond Mining and Development Co. have filed articles of incorporation with the Secretary of State. The directors are: Edward B. Thomas of Sacramento, John C. King, John R. Avis, F. T. Van Fleet and John J. Avis of Sacramento. The capital stock is $100,000, divided into 100,000 shares of $1 each.

NEVADA COUNTY, and Grass Valley in particular, is about to witness such an era of prosperity as has never before been known, says the *Transcript*. Every day or so new companies are being formed to develop old mines which are known to have merit, or new locations which are favorably situated for developing gold producers.

A BIG silver meeting was held at Eureka, Cal., last week, and the following resolution was ordered telegraphed to Congressman Geary: "*Resolved*, By the people of Humboldt county, in mass meeting assembled, that our representatives in Congress should oppose, by all honorable means, the repeal of the purchasing clause of the Sherman act, without substituting therefor the free coinage of silver at a ratio of 16 to 1."

THE Colfax *Sentinel* says: The North Fork of the American river is alive with men, all seeking their fortune. A couple of weeks ago some of the Gold Run boys went down to work on the river. They are organized as the "Hard Scrabble Miners of Pickering Bar." Monday morning another company, known as the "Rock-Me-Out Company" of Dutch Flat, under the leadership of Sim Jordan, went down to get out more gold for the market. H. Miner is at work on the "Never Sweat Bar." A. Beebe is working on the "Make-Me-Quick" claim, and W. H. Kinder and son are running the "Oh-Be-Joyful" claim.

THE Hancock Mining company has been incorporated with 100,000 shares of stock at a par value of $1 per share. The company organized with the following directors: Jackson Dennis, president; J. Nichols, secretary; W. D. Chambers, superintendent; John Brown and C. O. Mitchell; 30,000 shares of the stock have been taken in Amador City. The company proposes to sink a shaft 300 feet, says the Amador *Ledger*, about 25 feet from the ledge, and crosscut to the ledge and then drift both north and south. A water hoist is already contracted for and work will be commenced immediately. The ledge on the surface is from five to seven feet wide and shows $5 per ton in free gold.

ARTICLES of incorporation of the Horseshoe Mining Company have been filed at Grass Valley. The mine is to be incorporated with 100,000 shares, of the par value of $1 per share, with the following named gentlemen as directors: J. F. Cooper of Sacramento, T. R. Cooley, J. W. Rumsey, George Enright, Wm. Provis, Jr., of Grass Valley. The Horseshoe mine is situated on Wolf creek, below the Omaha mine and is owned by the Horseshoe Gold and Silver Mining Company, who have bonded the mine to the above company. The new company intends to push right ahead with the development work, as they are confident they have a good mine.

THE lessees of the Succor mine, Gold Hill district, Nevada, claim to have discovered that the Justin and Silver Hill mines have been working their ground. For several years prior to the suspension of operations in the Justice, that mine was producing steadily more than 300 tons of ore weekly, according to the reports of the superintendent, most of which Longabaugh the owner, alleges was stolen from Succor ground, the bullion proceeds of which is roughly estimated to exceed $1,000,000. Longabaugh has applied to the District Court for an order for an underground survey of the Justice and Silver Hill workings

to ascsrtain ths number of tons of ore extracted from ths Snccor by those companies as preliminary to entering suit against them to recover ths amount of the bullion ths ore produced.

DURINO the latter part of the present month (Angnst), says ths Virginia *Chronicle*, the Comstock mining companies have shipped a largsr amonnt of ors to the river mills for rednction than for a long period of tims prsvions. Most of the ors shipped is from ths Gold Hill mines. The ore is milled at the Msxican, Santiago and Brnnswick mills on the Carson river. Last Wednesday the V. & T. railroad transported 25 loaded dumps to ths river mills; on Thursday the same numbsr, and yesterday 39. To-morrow morning a train of 50 carloads of ors will be shipped—14 cars from the C. & C., 12 from the Kentnck, 16 cars of Yellow Jackst ore, and 8 from the Crown Point. The capacity of an ore car is eight tons, bnt the dnmps ars not loaded that heavily. Thirteen cars averags, as at present loaded, abont 104 tons. The V. & T. has on the road 115 ore dnmps, but all are not needed, even dnring the present heavy shipments. Yesterday a donble header bronght in 60 dnmp cars. By ths end of the month the ore bins at the mines shipping rock to the river mills will bs prstty well emptied.

Something About Big Guns.

The largest projectile ever made—if, indeed, any of them have been made—ls that for the Krupp gun now at the Chicago Fair. The projectile for that is four feet long and weighs 2700 to 2800 pounds, writes W. C. Dodge to *Inventive Age*.

The gun itself welghs 248,000 pounds, or 124 tons, ls 46 feet 2 inches long and 6 feet 7⅛ inches at the breech—the largest ever made, though Krupp previously made one or more for Italy that weighed over 118 tons, in 1886, and England some that weigh 100 tons. This Krupp gun will take 700 pounds of powder for a charge and it will cost about $1500 at each discharge. It is estimated that it will pierce 20 inches of steel armor at a distance of 9 miles.

Krupp had a 14-inch gun at the Philadelphia falr, and at the Paris exposition of 1867 he had one weighing 50 tons, 14-inch bore, 17½ feet long, the shell for which weighed 1080 pounds, and the solid shot 1212 pounds. These Krupp guns are made of solid steel and are not built up in sections as are ours and the English guns.

When Gen. Gilmore planted his "Swamp Angel" in front of Charleston the London *Times* ridiculed the idea and said no gnn ever had been or probably ever would be made that could throw a shot five miles. At the queen's jubilee a year or two ago one of thelrs threw a shot 12 miles, and one of our officers made a calculation which was published beforehand of what its flight would be and varied but a few rods from the actual result. It is calculated that some of the guns in existence to-day will throw a shot 15 miles.

Some idea of the tremendous power of the 110-ton gun can be formed when, as is stated, it has thrown a 16-inch steel projectile, 4 feet long, at a velocity of 2079 feet a second, piercing 20 inches of steel and many feet of timber backing. To strike such a blow, it is said, a locomotive weighing 200,000 pounds would have to go at the rate of 135 miles an hour! Persons who have witnessed the effect of a collision with a train moving 30 miles an hour can by that means obtain a faint idea of what the result would be.

Deep Mining in African Reefs.

In the London *Mining Journal* for July 22d there is a long article headed "Progress on the Rand Gold Fields," wherein it is stated: "The workings of the auriferous deposlts of the Witwatersrandt has certainly led to advances in mine management and the treatment of the ores, which it is not too much to say has opened up splendid new vistas for gold mining not only in South Africa but in many other parts of the world. The "main reef" series has been struck at a depth of nearly a half a mile—an event which gives qulte a new aspect to auriferous mining.

"The length of the Witwatersrandt reef is about 40 miles, and at the enormous depth mentioned seems to show that the mlning industry has before it the work of dealing with a gigantlc mass of gold-bearing strata. The assays of the core from the deep borings average 23 dwts. to the ton. The gold was struck not only at a vertical depth of 2400 feet, but at a distance of one mile from the outcrop."

It will require, however, large quantities of the conglomerates to be extracted from the deep workings and milled to prove the truth of the reports of their uniform richness. The word "reef" must not be taken in its ordlnary meaning. The reefs are not lodes or veins in any sense, but are true gravel or conglomerate beds. The term "banket" is often applied in Africa to any conglomerate bed, whether it contains gold or not.

THE Denver *Mining Industry* estimates that there are 60,000 men in Colorado who want work, and who are idle because they cannot get it. The population of Colorado is given by the last Federal census at 412,198 and the popular vote for President in 1892 was 93,891. It would appear from these figures, therefore, that two-thirds of the adult male population are without employment of any kind. It is hardly probable that the actual condition of things is so bad, though it is qnite bad enough.

The Mines of Nevada District.

TO THE EDITOR.—Although the depreciation of silver has had a disastrous effect upon some of the mlnlng disdricts of this coast, it has by no means seriously affected others. Some of the gold-producing districts have assumed a new and active life which could not have been derived from any other source short of new and fabulously rich strikes. Amongst the old districts whlch have received new impetus Grass Valley and Nevada City may be counted. The quartz-mining interests in Nevada districts, especially those within a radius of five miles from Nevada City, are attracting considerable attention at present.

Old and abandoned mines, a few years ago considered worthless, are turning out to he valuable properties, and, as a consequence, all of the old prospects and abandoned mlnes are belng lnvestigated and opened out anew. A great many of the silver men, who were compelled to shut down their mines on account of the decline in silver, are lookling for gold properties, and the gold men are now opening up all of those old propertles which they find will pay well to work by the improved methods of to-day ln order to meet the demand.

The Mountalneer, Providence and Champion mines are all working a full force of men, and their yield of bullion for this year is expected to be np in the figures that will attract the attention of the mlning world to the mines of Nevada City in the futnre.

Work is now under way on the Home mine, situated on Deer creek, a short dlstance below the Providence and Champion. This is an old property, worked in a primltive way years ago, and was finally shut down. In the intervening years, the old workings, situated in the creek bottom, had been totally obliterated by being covered to a depth of some twenty or thirty feet with the debris from the mines above. The present work ls being done on the hillslde, a short distance from the creek. Like many more of the old abandoned properties in Nevada county, worked with varied success in the palmy days gone by, many stories are told of the richness of the ore taken from this ledge. The Wyoming, whlch is situated across the creek from the Home, is shut down at present, the property being in litigation. This mine is also an old one and was worked years ago. Some very rich ore had been extracted.

One fact has been clearly demonstrated and that is, the veins in this district go down an unknown depth, and the most of them are true fissures. The mineral wealth of Nevada district ls unlimited, and all it requires to develop lt is the judicious use of capital by enterprising men who will open up those old properties and develop new ones to their own individual benefit as well as the benefit of the community. Such men, if they will investigate this district, will find many opportunlties for a safe lnvestment that will bring them handsome returns.

There is considerable prospectlng going on in this district this season and some new ledges that promise to become good paying propertles have heen uncovered. Through this and Grass Valley district, experience has taught the prospectors that whenever a ledge is rich in the croppings or near the surface it is invariably rich below the water level, although the pay may gradually diminish from the surface down to the water level in the mine. Could hydranlic mining be resumed to the extent it was carried on before the mines were shut down a few years ago, in the gravel mining sections above here, in a short time those old camps would be infused with new life, and the output of gold—the output of those hydraullc mines—would, to a great extent, decrease the general depression in business, and tend to establlsh good prices for the farmers' products in our local markets. It wonld at least greatly increase the demand for farm products in the counties and those adjoining where the mines are situated, and serve as a mirror to reflect back the farmers' folly in opposing the workling of those hydraulic mines. They have been the means of furnishing hlm a local cash market for his products in years past. I have met farmers on this trlp who say, "Let every hydraulic mine in the country run and give us back the cash market they afforded us ln the past, and glve us a chance to live and get out of debt instead of facing ruin and failure as we are to-day." Those men speak the truth, and realize the dlfference between prosperity and financial embarrassment, and if the radical farmers who "are cutting off their nose to spite their face," by so strongly opposing the resumption of hydraulic mining, could only see their folly as some of these foothlll farmers do, the difficulty would soon be adjusted and an era of prosperity would soon dawn on sunny California once more.

ALEX QUARTZ.

Nevada City, Cal., Aug. 28, 1893.

A New Metallurgy.

[Paper read before the San Francisco Academy of Sciences, Aug. 14, 1893, by Admiral Selwyn of the British Navy, describing his "Zymean Process of Ore Reduction."]

As the public are apt to suppose that a so-called "outsider" cannot know anything about a specialty such as metallurgy, it may not be out of place that the author should endeavor to show the course of events which led him to prosecute researches into the subject of humid processes for the extractlon of metals from their ores. Having been requested in 1871 by an English company, on the board of directors of which I had several personal friends, to proceed to the Territory of Utah, in the United States, in order to report on what was being done at some mines in which they were large shareholders, circumstances led to the stay I had originally intended to make being mnch prolonged. The mlnlng district in which the greater number of the company's mines were situated, known as Ophir Canyon, ls abont 30 miles westerly from Salt Lake City, and the mountain range of which Ophir Canyon is one of the most remarkable gorges, or valleys, had for a considerable time been known to contain rich veins and lodes of silver and silver-lead ores. Of the latter, the foot-wall is generally quartzite and the hanging-wall mountain limestone, full of fossils, the bedding being more or less an approach to the horizontal. The former are in the mountain limestone, and approach the vertical, their strike and dip varylng very widely.

Now seeing that the fossils were clear evidence that the limestone had once been liquid mud, or these shells could not have been included in their generally perfect state; seeing also that, whether the veins occurred at the contact of the two rocks or in the fissures of the limestone, the metalliferous ores had evidently been deposited in the veins or lodes subsequently to the solidification of the llmestone, it seemed to be a reasonable theory that nature had employed some solvent of the metals at the time of the formation of the mud, and from my recollection of Hugh Miller's proofs from the ganoid and ctenoid fishes, I believed that this solvent might well have been a hot salt-water ocean. I had no books to refer to, so I took the ores, powdered them and submitted them to the actlon of boiling brine. In no long time I found that abont half of the silver and lead contained by assay, had gone into a clear solution as chlorides. I had in fact followed unconsciously the experiments of Longmald in 1835 and Henderson in 1840 and had obtained the same results.

Bnt 50 per cent of the metal contained would but ill satisfy the mlner, and I began to consider that, given a hot salt-water menstruum, nature, or rather Providence, must have had an enormous amount of free chlorine to leave behind an ocean of chloride of sodium solution, after chloridizing all the other metals. If this were the case, then a little hydrochlorlc acid would marvelously improve the solvent powers of the brine employed. On testing this idea, with no more than ten drops of hydrochloric acid to a pint of saturated salt water, I found that practically, given sufficient tlme of boiling, the whole of the metals present went into solution, and in some instances, wlth silver, the fire assay was found to give less than that extracted by the humid method.

But still there were refractory ores which contained snlphur, antimony and arsenlc, and these, without a previous roasting, could not be successfully treated by any humid method then known, nor had any one up to the date of my dlscovery in January, 1887, ever snceeeded in conquering thls difficulty by any process which could be considered really feasible on the large scale at a mine remote from civilization and cheap chemicals. Even where chemicals were abundant at a low price, and the use of aqua regia or even cyanide of potassium could perhaps have been resorted to, the large quantities of such substances required to treat 100 or 200 tons of ore per day, their dangerous nature and many other considerations forbade entirely their practical use by rough miners at the mines, yet this is the chief condition of a paying result to the men who are primarily interested, *i. e.*, the capitalists who furnish the money and the miners who furnish the skill and the labor of mining enterprise.

On an average throughout the world, except in hydraulic mines or in the gold-washing districts, not more than one dollar is returned for each dollar spent in underground mining. Bnt if, instead of the low percentage of metals now extracted (the average for gold is not much over 50 per cent of that contained in the ore by assay), more nearly the whole could be obtained, then indeed the dollar expended might return two dollars instead of one—100 per cent instead of nothing—and even more if at the same time the expenses of extraction were materially reduced, and all the now wasted metals and metalloids were returned on the profit side of the balance sheet.

Thus it was an object well worth the attainment if only the difficulties could be overcome whlch had hitherto stood

in the way, especially with those ores denominated "rebellious" or "refractory," because containing sulphur, arsenic and antimony, besides base metals in large quantity, they required so long, so expensive and so complicated a treatment by igneous action as to transfer the greater part of the profits of the capitalists, or the miner, to the pockets of the carriers or the metallurgist.

To show how hardly the burden fell on the former, even where they were able to set up their own reducing works at or near the mines, it may be mentioned that out of a total expense in the United States for treatment of rebellious ores of $12, or say 48 shillings per ton, $8, or 32 shillings per ton went for roasting alone. At the same time the work of the mine as to "output" was bound down by the capacity of the furnace, rarely more than 50 tons per day being obtainable even from a Stetefeldt furnace costing $45,000. Even after the roasting, and the subsequent chloridizing with salt, either amalgamation with mercury or some other equally tedious process had to be resorted to before the bars of metal could be sent away from the mine; and even then the metals were impure and required another and more accurately conducted treatment before attaining a condition of such purity as would give all the value of each metal in the market.

In every way it was clear that if, after comminution, which can now be done by many different methods at a very small expense per ton, all the contained metal of any ore could be at once brought into solution in a short time and at as moderate expense as the crushing, without the use of any additional fuel, and each metal could then be precipitated pure in a separate vessel, very great progress would have been made in the science of metallurgy and highly economical results would follow. The first part of the problem was to get a method which would effectually bring all the metals into solution, and this had already been done by chlorination to a limited extent. A more perfect result might therefore be obtained by following up that method and chloridizing not only the ordinarily tractable metals, but also antimony, arsenic and the other metals known to chemists as forming chlorides. The extraction of the metalloids seemed also to be possible.

With what was already known of the powers of aqua regia or nitro-hydrochloric acid, and the more intense action of all acids in the nascent condition, it became obvious that a solution which should fulfill all the needed conditions would be one in which the chemical substances present could, on the introduction of the ores, so act and react on each other as to generate nitric, sulphuric and hydrochloric acids at the same time and with a superabundance of chlorine, since the last reaction must leave all the metals in the state of chlorides.

Therefore a saturated, or nearly saturated, solution of salt (say from 22 to 25 per cent of salt in water) would be the bulk of the solution desired. If to this were added sufficient nitrate of potash or soda (by preference the latter) to give whatever nitrogen is necessary to dissolve gold and other substances only soluble in nitro-hydrochloric acid, and which might be present in the ore, the elements would be combined, which, with pyritous ores, might react on each other to produce the three acids in the nascent state and dissolve all metals and metalloids that might be contained, leaving them in the state of chlorides. There was something, however, still wanting—the key, namely, that should unlock the combinations rapidly—and this was sought and found in the substance known as the dichloride of sulphur S_2Cl_2, and used principally for dissolving and cold vulcanizing caoutchouc. It is easily and inexpensively made from the sulphur of pyritous ores as obtained in the course of extracting the metals from their ores by this method, and from the chlorine gas which is also then generated, given off, and may be collected. S_2Cl_2 easily separates into its coostituents, if brought into contact with water, even at ordinary temperatures, and more rapidly as the temperature is raised, producing eveotually hydrochloric and sulphuric acids, and thus, so to speak, unlocking all the other reactions. But there are many and rich ores where no sulphur is contained, and with these, if this process is on other accounts preferred to amalgamation, it would be necessary to supply sulphur from some other source. This is generally easy in most mining districts, for the total absence of pyrites in some form, or of sulphides of some metals, is of the rarest occurrence, and even in those mining camps where at first nothing but free gold is to be found, no sooner is the water level reached than the sulphides make their appearance. Now it is not to be supposed that this method of extraction will supersede hydraulicing or amalgamatioo at once where the ores are free milling, though even that may eventually be found desirable, but wherever the gold is mainly float gold, in which case there had always been a great loss on the assay value, it is certain to come into use as soon as known, for it leaves no more than a trace in the tailings and occupies less than one hour in doing it. With copper, too, it offers almost incalculable advantages, for even from ores containing as much as 55 per cent the metal is obtained absolutely pure in about 4 to 5 hours instead of 21 days, which are occupied in smelting, and then it is impure metal that is produced, not telegraphic copper. Besides all this, it is well known that what are called now "rare metals" are constantly to be found in admixture with ordinary ores, but very rarely is any notice taken of them, in consequence, sometimes, of the minute quantities per ton of mineral, but more often on account of the difficulty hitherto attending their separation from the principal metals sought for by the miner and metallurgist. As by this system of metallurgy every one of the contained metals is brought into solution as a chloride by the same treatment at one and the same time, the only question is how best to precipitate each metal in a state of purity, no other being precipitated at the same time or in the same vessel.

Before going into this part of the question it seems desirable to give the formulæ, so far as they are at present known to me, which seem most nearly applicable to the reactions that take place in a boiling tank or vat. Richter says $H_2O+2Cl=2HCl+O$.

(I) Brande says S_2Cl_2 is composed of sulphur 30, chlorine 68.4. In presence of water, sulphuric and hydrochloric acids are formed, in consequence of the decomposition of the water.

(II) Watts' second supplement, page 321. Art., chlorine:

(1) The water is decomposed by the chlorine, $H_2O+2Cl=2HCl+O$.

(2) The chloride is decomposed by the water $2_2NaCl+H_2O=Na_2O+2HCl$.

(1) $S_2Cl_2+H_2O=H_2SO_4+HCl$.

(2) $NaCl+H_2SO_4=HCl+NaH_2SO_4$.*

(3) $NaNO_3+H_2SO_4=NaH_2SO_4+HNO_3$.

(* Query, $NaH_2SO_4+Cl=NaCl+H_2SO_4+O$.)

But as metals, when introduced into this solution, are rapidly attacked, even when in the state of sulphates or sulphides, and are converted into chlorides, *e. g.*, galena and copper pyrites, sulphate of soda, etc., a different formula from that which supposes the formation of sulphate of soda (see No. 2) must be found, and this agrees with Sir H. Davy's observation that salt is a chloride of the metal *sodium* and therefore we ought to get chloride of sodium in the last place and not sulphate of soda. This is precisely what does occur, in the presence of large quantities of nascent chlorine. Sulphuric acid is liberated, HCl acid gas is given off, and NaCl is formed anew. But neither chlorine nor sulphuretted hydrogen are found, because in presence of water they destroy each other. With rare exceptions, therefore, these gases are not observed, but as it is well known that chlorine will deoxodize all substances capable of being converted by it, at less than the temperature of boiling water, and as all metals and some metalloids come under these conditions, they are all equally affected and become chlorides, after a greater or less time of exposure to nascent chlorine gas, in contact with water. When, after filtration, reagents are used, which precipitate each metal in a state of metallic purity, the chlorine combined with them is at the same time liberated, and taking hydrogen from the water, becomes hydrochloric acid, according to the formula $H_2O+2Cl=2HCl+O$. But in dealing with ores on which concentratinn has been used, it is to be recollected that such mineral is no longer in the state of proportion in which it was deposited by natural causes, and the substance of greatest specific gravity will be largely in excess. Unfortunately these are base metals, such as copper, iron and lead, although the nobler metals are also raised in percentage by the same concentration to a certain extent. If dealing with float gold ores, of course it is sheer folly to attempt to concentrate by any humid action that does not dissolve it. But in ordinary concentrates, we shall find that on boiling, the copper, iron, sulphur and arsenic are the first things to go into solution, and that these are capable of influencing the specific gravity of the solution to such an extent as to completely saturate it, and render it incapable of acting on the nobler metals.

The same or a similar thing can occur when slimes containing much alkaline base are treated, for then it must have its share of the acid first, before any of the metals except the sodium, the copper and the iron will work, and this will have the effect of liberating large quantities of carbonic acid gas, which can be collected and stored under pressure—if for no other use than to make soda water (so called) for the miners. But it is, for some metals, an excellent precipitant. Remsen says, when sodium nitrate is treated with sulphuric acid, $NaNO_3+H_2SO_4=NaH_2SO_4+HNO_3$.

Brande says, p. 594-5, article, chlorine: All the metals appear susceptible of combining with chlorine and of producing a class of compounds which may be termed metallic chlorides. There are a few of the metals which resist at common temperatures, but when heated combine with it, some slowly, others rapidly, and with intense ignition.

The attraction of chlorine for metals is greater than that of oxygen, consequently when a metallic oxide is heated in chlorine, oxygen is evolved, and a chloride is formed. The insoluble chlorides are also formed by adding solution of chlorine or of the soluble chlorides, or of hydrochloric acid to the soluble metallic salts.

Turner, page 408-9: Two only of the metallic chlorides are decomposed by heat, gold and platinum. All the chlorides, excepting those of silver and mercury, are readily decomposed by hydrated sulphuric acid, with disengagement of HCl acid gas. The change is accompanied with decomposition of water, the hydrogen of which combines with chlorine, and its oxygen with the metal. All chlorides, when in solution, may be recognized by yielding with nitrate of silver a white precipitate, which is chloride of silver.

Richter, in his Inorganic Chemistry, says on Halogens, page 49: The great affinity for hydrogeo of *chlorine* (translation by Edgar Smith, *als eidos* having the form of sea salt) is manifested in the hydrogen compounds. Most of these are so decomposed by the chlorine that it removes the hydrogen from them and forms hydrochloric acid.

Thus water is decomposed by chlorine into hydrochloric acid and oxygen according to the formula $H_2O+Cl_2=2HCl+O$.

To start with, this statement, on excellent German authority, is certainly perfectly intelligible to all chemists, and even to many others who, like myself, lay no claim to general chemical skill, and if the fact is borne in mind that dichloride of sulphur instantly separates itself, on contact with water, into chlorine and sulphur, and, as shown above, the chlorine so produced decomposes the water, and leaves free oxygen, we shall be able to see what the sulphur does, so soon as it acquires its liberty.

$S_2Cl_2+H_2O=H_2SO_4+HCl$.

That is, as soon as the chlorine has taken the hydrogen of the water into partnership, the abandoned oxygen allies itself with the free sulphur and becomes a strong acid in the nascent state, called sulphuric acid. At the same time the alliance of the chlorine with the hydrogen has given rise to another acid in the nascent state, called hydrochloric or chlorhydric acid. If nitrate of soda $NaNO_3$ is also present it would at first sight be supposed that sulphate of soda and nitrous oxide would be produced in the presence of nascent sulphuric acid, and no doubt this reaction does take place, just as much as with the chloride of sodium. But again the nascent chlorine asserts its supremacy over all metals, and the sulphate of soda has to become without any delay NaCl, chloride of sodium, common salt, again, the nitrous oxide becoming nitric acid. When in such a solution as we have been now considering, metallic compounds are present, the chlorine at once separates every one of them from its previous combination and reduces or transforms each into the state of a soluble metallic chloride—soluble in a hot salt water menstruum and capable of being separated from the combination with chlorine by a great variety of precipitants, foremost among which is an electrical current of low intensity but enormous quantity, if only sufficient time be available without inconvenient results. Such and no other do I believe to have been and still to be nature's precipitant for the metals, but the life of man is too short for him to adopt it, if more rapid action can otherwise be secured. Therefore the young metallurgist is taught to use what are called "group" precipitants, and from practice on the large scale he soon learns the use of certain "special" precipitants which deal more satisfactorily with the particular metals he wishes to obtain from his solution. The art is, however, far from being perfect, and often calls for the sacrifice of a common metal in order to obtain that which is more precious. Thus we still sacrifice a large percentage of iron to obtain pure metallic copper, and it answers well enough where scrap iron is a drug on the market. But not at a copper mine, remote from transport, can such a method be a really practical success, and better means can be found, and will no doubt be soon adopted, which will give us the copper (as is done when precipitating with iron) in a chemically pure and metallic state, ready to be cast into bars. When this can be done with every metal, we shall have reached that stage of progress which I have here shown is now available, as far as bringing metals into solution is concerned.

But even at the present time, gold can be and is precipi-

NOTE.—The equations (or formulæ) shown at the Academy were as follows:

(1) $H_2O+2Cl=2HCl+O$.—Authority, Richter and others.

(2) $S_2Cl_2+H_2O=H_2SO_4+HCl$.—Brande, &c., &c.

(3) $NaCl+H_2SO_4=HCl+NaH_2SO_4$.—Turner, &c., &c.

(4) $NaH_2SO_4+Cl=NaCl+H_2SO_4$?—(Suggestion.)

(5) $NaNO_3+H_2SO_4=NaH_2SO_4+HNO_3$.—Watts, &c., &c., Remsen.

(6) $NaH_2SO_4+Cl=NaCl+H_2SO_4$?—(Suggestion.)

These suggested equations are given because, as a fact, no sulphate of soda, but pure chloride of sodium, is found at the end of the operation.

tated by sulphate of iron; silver by sulphide of sodium or calcium; copper by iron; lead by washing soda, etc. To a skilled metallurgist there is no great difficulty, but only objectionable delay, in completely precipitating any metals likely to occur, when once they have been brought into solution as chlorides, and precipitating them in a separate and pure state, as far as admixture of any two metals is concerned, though often recovered as sulphides, which are cumbrous and bulky, and therefore, if possible, to be avoided.

But I do not, at present, wish to bring forward new means by which I believe more rapid and complete precipitation can be obtained, of each metal by itself. If I am able to convince the audience that all the metals can be brought into solution from any ore, however refractory, at the mine, cheaply and speedily—that is, I submit, a long step towards giving the miner a very much greater share of profit than he has hitherto been able to obtain, and may even enable him to continue producing silver at a profit although the market price should fall to 50 cents an ounce.

Review of Admiral Selwyn's Lecture.

The subject of the admiral's lecture is one which always interests our mining men, and, while it is an ungracious task to point out the errors and fallacies of a gentleman who seems to be quite honest in his endeavor to improve the practice of metallurgy, yet the exalted station of the lecturer, the circumstance that the lecture was delivered in the hall and under the auspices of the Academy of Sciences, and the fact that it has excited considerable interest among many who do not assume to be competent judges of the subject, make it our duty to notice what we should gladly have passed over in silence. There are heights of absurdity and abysses of error which one can but contemplate with astonishment and a sense of utter hopelessness, and this is a case in point.

When the admiral meddles with chemistree,
He's just where an admiral ought to be—
All at sea.

It would be superfluous to point out to chemists or metallurgists the fallacies, the false equations and the impossible combinations which are offered us, and to explain them to those who are not chemists would be an equally thankless task. The chemist needs no prompting to see the absurdity of the formula NaH_2SO_4, representing a compound which is neither known nor suspected to exist, though apparently intended to represent hydrogen sodium sulphate, nor to perceive the falsity of the ostensible equation $S_2Cl_2+H_2O=H_2SO_4+HCl$. Neither is it necessary to call the attention of the scientist to the gratuitous and unwarranted assumption that all of the metals ever existed in the form of chlorides. But we understand the admiral does not attach much importance to these matters, but pins his faith to what he alleges to be practical facts, and as our non-chemical readers probably take a similar view, we will confine ourselves chiefly to that aspect of the case.

First we must notice what seems to be a misunderstanding as to the chief reagent used in the process. The admiral *calls* it dichloride of sulphur, and *writes* it S_2Cl_2, which is the formula of the monochloride. He says it is the substance formed by passing chlorine over melted sulphur, and is used to dissolve and cold vulcanize caoutchouc, which indicates the monochloride again; and yet he gives the percentage composition of the dichloride.

The fact seems to be that the substance is really the monochloride, which was perhaps called dichloride by the old chemists, just as cuprous chloride used to be called dichloride of copper. The formula SCl in the old notation is SCl_2 in the new, having, in each case, the percentage composition given in the lecture, allowing for the rectification of the atomic weight of chlorine. The S_2Cl_2 of the present system corresponds to S_2Cl in the old system and contains 52.56 per cent of chlorine.

It is not merely a question of name; the reactions of the two substances differ in important particulars. As the admiral uses the symbol H_2O in his other formulas, we conclude that he intends his S_2Cl_2 in accordance with the new system, but has mistaken the name through reading old authors; this assumption accords best with his general statement.

The lecturer makes the following assertions :

(1.) That the sulphur compound S_2Cl_2 forms sulphuric and hydrochloric acid on contact with water.

Mixter says :

$2S_2Cl_2+2H_2O=4HCl+SO_2+3S$, and with another molecule of water we have $SO_2+H_2O=H_2SO_3$.

This means that we get hydrochloric acid, sulphurous acid and sulphur, not sulphuric acid, as stated by the lecturer. It is true that sulphurous acid, H_2SO_3, in cold solution, does slowly absorb oxygen from the air, forming sulphuric acid, H_2SO_4, but in a hot solution even this cannot occur; the sulphurous acid rapidly evaporates unchanged. If we should use the true sulphur dichloride, SCl_2, we might have some sulphuric acid formed, because that substance gives off chlorine, leaving sulphur monochloride, S_2Cl_2, which then decomposes as above, and sulphurous acid *with chlorine* forms sulphuric and hydrochloric acids. But, in fact, as repeatedly stated by the admiral, sulphate of soda is not formed, although salt is present, and that *proves* that sulphuric acid is not produced, which again proves that chlorine is not evolved, and hence the sulphur compound is not the dichloride SCl_2.

(2.) That sulphuric acid produces chlorine from salt water.

This is an error, as every chemical tyro knows. It produces hydrochloric acid and sodium sulphate, or disulphate. (The above assertion has been made and insisted on in conversation if not in the lecture.)

(3.) That salt water converts all metal sulphates to chlorides.

This is not true. Salt water converts to chlorides those sulphates of which the bases have less affinity for the sulphuric acid radical than the sodium of the salt has, and then sodium sulphate is formed. Potassium sulphate is not changed to chloride by salt water. Copper, iron and lead sulphates are so changed.

(4.) That sulphuric acid does not produce sulphate of soda from salt water in this process, or that any sulphate of soda formed is changed to chloride by chlorine.

Error. In the first place, chlorine is not produced in the process; in the second place, chlorine cannot change sodium sulphate.

(5.) That the sulphur chloride acts like a ferment, starting a reproductive action which continues as long as any ore remains.

This is arrant nonsense. If it were true, an ounce of the stuff would suffice for an unlimited quantity of ore; a little fermenting pulp from a vat in operation would suffice to start fermentation in another charged vat, and there would be no necessity for constantly preparing the ferment anew.

(6.) That the acids are more active in the "nascent" state than otherwise.

This is more than doubtful. No chemist, we believe, talks of nascent hydrochloric acid. The theory of the *statu nascendi* is applicable only to elementary atoms and compound radicals which act as such; neither hydrochloric nor sulphuric acid is either of these. So far from being in *statu nascendi* at the moment of formation, they are more like newly-married couples, to be parted only by high temperature, or by the offer of greater inducements to the components to form new alliances, in which case a divorce must precede or be simultaneous with the readjustment.

What then does this process amount to? To treating the ore with hot hydrochloric acid, unless nitre is added, in which case we shall have a portion of aqua regia, and *then* we must form sulphuric acid which, however, at once acts on the salt water with production of hydrochloric acid and sulphate of soda. There may be an advantage over the simpler process of adding hydrochloric acid to the brine, in this way: The sulphur chloride sinks to the bottom of the vessel; the ore also sinks. The acid produced then attacks the ore, while not diluted so much as it would be if simply added to the brine.

It may be, also, that a part of the sulphur chloride is decomposed, not by the water, but by the minerals in contact with it, the chlorine thus not forming hydrochloric acid, but uniting directly with the metals. This is indicated by the statement that the gold in an ore is acted on, even in the absence of nitre, but not rendered completely soluble, as it would be if aqua regia were present, or free chlorine were evolved "in large quantity."

The lecturer says that our metallurgical processes are too complicated for the use of "rough miners." What does he offer us in exchange? The rough miner must provide a little sulphur to begin with, salt, a dynamo and an engine to drive it, apparatus for making the sulphur compound from sulphur recovered, and chlorine developed by electrolysis from salt water; a number of vats for dissolving, filtering, and precipitating the different metals separately, either in metallic state or as compounds; precipitants, or material and apparatus for making them; apparatus for filtering, washing, drying and reducing the various metal compounds obtained, and for melting the metals; and a large and varied assortment of chemical and mechanical knowledge and skill to enable him to execute the multitude of operations required, not forgetting the final purification and restoration of his salt bath, which is not to be thrown away, but used over again *ad infinitum*.

And in the wild and woolly West, to which this beautifully simple (?) process is so eminently adapted, many of the substances which must be separated, if the bath is not to be thrown away, would not be worth the freight to a market.

That this process will extract the metals from many ores, if enough of the medicine be used, may be admitted, and more so if nitre is added. That it is cheap, simple, or desirable in any way, we cannot concede. And our readers may be sure that the sulphur compound must be used in even more than the quantity which may be chemically equivalent to the compounds to be decomposed by it, including the carbonate of lime which is so common a constituent of silver and copper ores. The proposal to utilize the carbon dioxide evolved in making "soda water," for the refreshment of the weary workman, must be a joke, or it is too silly for comment.

If we have an ore with five per cent of galena, and nothing else, such as lime, to consume hydrochloric acid, we shall require 177 pounds of S_2Cl_2 per ton to produce the hydrochloric acid strictly necessary to convert the lead into chloride; but much of the acid will be lost, so we may say about 200 pounds to a ton of such ore. It would require about 94 pounds of sulphur to reproduce the reagent; a part or all of this sulphur would be recovered from the operation. If nitre were also freely used, it would economize the sulphur chloride.

We advise our non-chemical patrons to leave this process alone, and not be mislead by the ancient and worn-out pretense that professional metallurgists in general will not receive a really valuable new process with open arms. It is now many years that this process has been in evidence, more or less, and it is in use nowhere.

EDITOR MINING AND SCIENTIFIC PRESS.

Diminished Wheat Supply.

Whatever the effect upon the market, says the London *Farmer*, it is certain that the supply of marketable wheat will be materially less this year than it was in 1892. This applies to the total contributions—home and foreign—to British as well as other markets. We notice that *Beerbohm* ventures upon a quantitative comparison of the production of wheat this year and last in the United Kingdom, France, Germany, Hungary, Roumania, Bulgaria, Spain, Italy, the United States, and India, making the total for 1893 something under 187,000,000 qrs., or 19,000,000 qrs. below the return of 1892.

It will be noticed that several important wheat-growing countries are omitted from this estimate, notably Russia, the Argentine Republic, and Canada. The Russian crop is as yet too uncertain to permit of a fair estimate. In the Argentine Republic a substantial increase is expected, but this again will probably be fully counterbalanced by the anticipated falling-off in the Canadian crop. It has to be noted, however, that the stock of old wheat in the United States is about 6,000,000 qrs. in excess of that held last year, which makes up for about a third of the deficit in this year's crop. Russia may alter this estimate to some extent, of course, but the chances of the deficiency being fully made up are very remote.

If this seven per cent estimated reduction in the wheat produce of the year has any effect in raising the price of wheat to something like the figure of former times, it will be a welcome state of things to the British wheat-grower.

The United States' crop is now believed to be even less in bulk than was expected a month ago. The latest report issued from the United States Department of Agriculture returns the winter and spring crops taken together at only 76.7 per cent of a full crop, as compared with 78.8 for June and with 90 for July last year. As the area of the crop is several millions of acres less than it was last year, it may now be regarded as almost certain that the total produce will be under 400,000,000 bushels. Last year the crop was returned at 516,000,000 bushels, and in 1891 at 612,000,000 bushels. To say the least, then, America will this year harvest 116,000,000 bushels less than the produce of 1892, and 212,000,000 bushels less than that of 1891. The home requirements for the cereal year are at least 370,000,000 bushels, so that America will have a surplus of less than four million quarters from the crop now being harvested. Allowing for the great stores of old wheat, the total surplus for export can hardly exceed thirteen million quarters, against more than twenty-three millions for the cereal year just ended in the United States, and over twenty-eight millions in 1891–92. Such a great reduction in the supply of wheat must tell sooner or later, even if the combined surplus of Russia, India and the Argentine Republic will make up for the deficiency in nearly all European countries except Russia.

India, on the other hand, has a good crop. In that country there are 26,238,000 acres under wheat this year, compared with 24,482,000 last year, which give an estimated product of 7,149,000 tons, or 32,548,300 qrs. of wheat, as against 5,535,000 tons, or 25,200,300 qrs. in 1892. These figures show India to have some 7,348,000 qrs. more to dispose of this season than last. If all this increased surplus should come into the market during the approaching season it would in some measure atone for the American falling-off. But as the condition of other crops largely influences the volume of Indian trade, the estimates really afford little criterion of what the extent of the shipment from that country may be. It may, however, be rightly contended that if prices remain at their present low standard during the coming season it will be from some other cause than an excessive supply.

A New and Important Book on Coal Mining.

JUST READY.

The Mine Foreman's Handbook

Of Practical and Theoretical Information on the Opening, Ventilating and Working of Collieries. Questions and Answers on Practical and Theoretical Coal Mining. Designed to Assist Students and Others in Passing Examinations for Mine Foremanships. By ROBERT MAUCHLINE, ex-Inspector of Mines in Pennsylvania, Superintendent of Coal Mines. A new, revised and enlarged edition, illustrated by 114 engravings, in one volume, 8vo, 337 pages, price $ 3.75.

☞ *By mail free of postage, at the publication price, to any address in the world.*

ABSTRACT OF CONTENTS.—Chapter I, Mine Gases; II, Safety Lamps and Instruments; III, Ventilation; IV, Ventilation Continued; V, Ventilation Continued; VI, Maps—Pillars; VII, Mine Timber - Dams, etc; VIII, Opening Collieries; IX, Railroad Tracks, Switches, Frogs, Pulleys, etc., in and about a Mine; Ind-x.

☞ *An Illustrated Circular of 4 pages, quarto, giving the full Table of Contents of the above volume, sent free to any one who will furnish his address.*

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other catalogues, the whole covering every branch of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish us with his address.*

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is berally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cash, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Scientific Progress.

Harmonic Vibrations.

Impolses which, occurring singly or at irregular intervals, are incapable of producing any noticeable effects, may, when made regularly, under favorable circumstances, yield astonishing results, says George M. Hopkins. The rattling of church windows by air waves generated by a particular pipe of the organ, a bridge strained or broken by the regular tramp of soldiers or by the trotting of horses, the vibration of a six or eight-story building by a wagon rumbling over the pavement, a factory vibrated to a dangerous degree by machinery contained within its walls, a mill shaken from foundation to roof by air waves generated by water falling over a dam, are all familiar examples of the power of regular or harmonic vibrations.

Harmonic vibrations result from regularly recurring impulses, which may be very slight indeed, but when the effects of the impulses are added one to another, the accumulation of power is sometimes very great.

To secure cumulative effects the impulses must not only be regular in their occurrence, but the body receiving the impulses must be able to respond, its vibratory period must correspond with the period of the impulses, and, further than this, the impulses must bear a certain relation to a particular phase of the vibration, in order that they may act upon the vibrating body in such a way as to augment its motion rather than diminish it.

There are railroad bridges that vibrate alarmingly when crossed by locomotives running at a certain speed, the vibrations being caused by the comparatively slight lack of balance in the driving-wheels and connecting rods. For this reason the speed is restricted on such bridges.

During the early tests of the East River bridge, between New York and Brooklyn, it was found that the structure was so massive and its vibratory period so slow that it could not be injuriously affected by the marching of men or the trotting of horses; consequently, travel proceeds on this bridge as upon any highway.

A well-known English physicist is reported to have said that with suitable appliances he could break an iron girder by pelting it with pith balls. An experiment of this kind would certainly show in a striking manner the effects of very slight rhythmic impulses. As it is manifestly impracticable to perform such an experiment, an easier method of illustrating harmonic vibration must be sought.

The Alloys of Lead.

Few metals form so many alloys as lead. It alloys with potassium, sodium, arsenic, antimony, tellurium, bismuth, tin, cadmium, manganese, mercury, silver, gold, platinum, paladium and iridium; not with aluminium, iron, cobalt, nickel, zinc or copper, says the New York *Tribune*. Alloys of arsenic with lead occur in leaden shot. Alloys with antimony are of great importance; type-metal is one. It is harder, more tenacious and more fusible than either of its components, and expands on solidifying, thus giving a sharp impression in the mold. Common type-metal contains about 15 per cent of antimony. An adulteration of six per cent of tin is said to promote durability. Many alloys are specified for various uses, stereotype plates, music plates, etc. It would seem that there is here a field for experiment and invention, inclusive of the introduction of aluminium and nickel, etc., and their alloys. Stereotype metal containing bismuth, which expands much in solidifying, has been tried; but bismuth costs now about $2 per pound. Alloys with tin include pewter, soft and hard solders, and fusible alloys. The latter are usually triple alloys of lead, tin and bismuth. "Rose's alloy" contains one part of lead, two of bismuth, and one of tin. It melts at 201 degrees Fahr. An American chemist named Wood, by substituting cadmium (a little less costly) for bismuth, got an alloy melting at 160 degrees. The addition of mercury to any of these reduces the fusing point still more. Solid metallic casts have been taken of living human faces, etc., by this means, which can then be multiplied indefinitely by electrotyping or otherwise. The uses of fusible alloys have been far from receiving from inventors the attention that they merit. Were there a large demand for bismuth it could be made a very much cheaper metal.

Aluminium in the Household.

The appearance of aluminium cooking utensils in the windows of hardware and grocery stores of San Francisco suggests the fact that the metal is becoming both common and cheap. We may expect that it will eventually become as useful in the household as tin or granite ware, and probably it will be found that it is quite as durable. Aluminium, though light, is nearly five times heavier than the lightest metal of somewhat similar kind, namely lithium, but all the other metals of the earths and alkalies are marked by their too great combustibility, of which property the photographer avails himself in magnesium, whence he obtains his flash light. Aluminium alone seems to be useful for mechanical purposes, and, it is said, does not combine with mercury, but there does not seem to be a field for it either in quality or price as the substitute for iron. Aluminium has been probably vastly overrated as a material for heavy structures, as bridges, etc., but this is no fault of the metal.

In this connection it is interesting to note a press dispatch from Duluth, Minn., August 23d, declaring that a local chemist has found a process for obtaining aluminium from its own oxide. The discoverer of this process and his Duluth associates say that they can produce pure aluminium at a price considerably below that of any of the electrical processes, and cheaper, bulk for bulk, than copper. Experiments have been under way where the clay is rich in aluminium, for much over a year, looking to the perfection of the process.

Soldering Glass and Porcelain.

The soldering of glass and porcelain with metals is a novel French process, and its adaptations are likely to be as numerous as they are valuable. It is also simple. The portion of the tube that is to be soldered is, according to an exchange, first covered with a thin layer of platinum, this deposit being obtained by covering the slightly-heated glass by means of a brush with very neutral chloride of platinum mixed with essential oil of chamomile, the latter being slowly evaporated, and when the white and odoriferous vapors cease to be given off, the temperature is raised to a red heat, the platinum is then reduced and covers the glass tube with a layer of bright metal. On connecting the tube thus metallized and placed in a bath of sulphate of copper to the negative pole of a battery of suitable energy, there is deposited on the platinum a ring of copper which will be malleable and very adhesive if the operation has been properly performed. In this state the glass tube covered with copper can be treated like a genuine metallic tube, and be soldered to iron, copper, bronze, platinum or any metals that can he united with the solder.

An Electrolytic Copper Refinery.

An immense electrolytic copper refinery has been started at Great Falls, Mont., by a Boston company. It comprises 288 depositing vats capable of containing at one time 1,600,000 pounds of pig copper anodes, and has a capacity of 1,200,000 pounds of pure electrolytic copper per month. The plant is run by water power, situated at a distance of 1200 feet from the works. The current is supplied by two dynamos, of 165 kilowatts capacity each. The total cost of the plant, exclusive of real estate, is said to have been over $350,000. The metal refined contains a large percentage of silver, all of which will be saved by the electrolytic process.

Metallurgy of Lead.

At the recent annual meeting of the Royal Society, held in London, a memoir on the metallurgy of lead was presented by Mr. J. B. Hannay. He described several new volatile compounds of lead, the discovery of which gave the key to the solution of many of the difficulties which had hitherto beset the path of the investigator, and by examining all the furnace reactions of lead compounds in the light of those discoveries he was enabled, he said, for the first time, to present a true explanation of the metallurgy of lead, founded upon accurate knowledge. The process consisted in passing a stream of air through the lead ore in a Bessemer converter, by which simple means the whole of the ore was converted into pig lead, or litharge, or sulphate of lead, as might be required, thus enabling the manufacturers to make the product bringing the best price in the market. The oxidation of the ore supplied all the heat required to conduct the process, so that no fuel was required. The importance of this new process, Mr. Hannay declares, might be judged from the fact that not only was the whole of the lead obtained as finished products without loss, as against 20 per cent loss by the old method, but every ounce of silver was separated and collected without any expense, no matter how little silver might be present.

Stone Under the Microscope.

It is often held that the best method of determining the probable durability of a building stone is to study its surface, or thin, transparent slices, under a microscope. This method of study in recent years has been most fruitful in developing interesting and valuable knowledge of a scientific and truly practical character.

An examination of a section by means of the microscope will show not merely the various substances which compose it, but also the method according to which they are arranged, and by which they are attached to one another. For example, pyrites is considered to be the enemy of the quarryman and constructor, since it decomposes with ease and stains and discolors the rock.

Pyrites in sharp, well-defined crystals sometimes decomposes with great difficulty. If a crystal or grain of pyrites is embedded in soft, porous, light-colored sandstones, its presence will certainly soon demonstrate itself by the black spot which will form about it in the porous stone, and will permanently disfigure and mar its beauty. If the same grain of pyrites is situated in or near very hard, compact, non absorbent stone, the constituent minerals of which are not rifted or cracked, this grain of pyrites may decompose and the products be washed away, leaving the stone untarnished.—Stone.

Bed of the Atlantic Ocean.

It seems that the hollow of the Atlantic is not strictly a basin whose depth increases regularly toward the center, the latest investigations showing that it is rather a saucer or dish-like one, so even is the contour of its bed. It is found that, proceeding westward from the Irish coast, the ocean bed deepens very gradually—in fact, for the first 230 miles the gradient is but six feet to the mile, though in the next 20 miles the fall is more than 9000 feet, so precipitous being this sudden descent that, in many places, depths of 1200 to 1600 fathoms are encountered in very close proximity to the 100-fathom line. With the depth of 1800 to 2000 fathoms, the sea bed in this part of the Atlantic becomes a slightly-undulating plain, whose gradients are so light as to show but little alteration of depth for some 1200 miles, the extraordinary flatness of these submarine prairies, therefore, rendering the familiar idea of a basin rather inappropriate. The greatest depth in the Atlantic is claimed to have been found some 100 miles to the northward of the island of St. Thomas, where soundings of 3875 fathoms were obtained. The seas around Great Britain, instead of forming part of the Atlantic hollow, as heretofore generally regarded, are now alleged to be rather a part of the platform banks of the great European continent which the ocean has overflowed.

Mechanical Progress.

Trying to Raise a Wrecked Steamship.

The abandonment of the attempt to raise the wrecked collier, San Pedro, in Victoria harbor, ends one of the most expensive and pretentious works of that kind in the marine history of the Pacific coast. It is estimated that the Southern Pacific company has expended no less than $250,000 in the effort. The ship has been lying on Brotchie Ledge for upward of 18 months, and the steel plates amidships have been punctured every two feet between the heavy ribs; besides the injury is so located that it is impossible to get at it. So long as the vessel remains on the rock the water cannot enter, but the moment she is lifted the sea rushes in with terrible force.

Since January of this year the work has been in charge of Capt. J. M. Lachlan, of New York. On March 16th Capt. Lachlan began active operations. By this time the upper deck had fallen in, and the vessel was so much injured that he was compelled to adopt the inclosed coffer dam which was afterward built.

After long work and several failures, arrangements were made for the final attempt. Capt. Lachlan says:

"I determined to make sure of the pumps and had four more placed in position on the wreck, so that last week, when we made our last test, there were all the pumps necessary. I had in all 23, with capacities ranging from 750 to 5000 gallons per minute. These were kept going steadily and incessantly for 14 hours and 20 minutes, and all that time were discharging over 130 tons of water per minute, so that the total discharge for the period mentioned was over 111,800 tons.

"At full high tide, when the water would flow no longer, and after all those hours of pumping, I had the tug Tacoma, one of the most powerful on the sound, try and pull her off. We used a hawser, a brand new one, 19 inches in circumference, but when this was straightened out there was not a budge. Then the Tacoma went back a little and ran ahead, giving the bawser a great jerk, but still there was no move. Once more this was tried, the Tacoma going back still farther, then full steam ahead with such force as to snap that big rope like a piece of twine, but the San Pedro did not even tremble.

"The attempts made during the last fortnight are the only occasions on which the San Pedro has ever been raised from the ledge. She has a double bottom, the false bottom, or the outer one, being four feet below the inner one. Now, let me tell you what the result of my work was. The forward end of the vessel, from the stem to the foremast, or the first bulkhead abaft the collision, was perfectly tight, with absolutely no water in it.

"In No. 2, abaft, I could control the water down as far as the orlop or lower deck, which was covered over, a false deck having been put in. In the boiler room I could do nothing except plug the leaks on the inner bottom, which is four feet from the real bottom of the ship. The outer bottom was pierced through and through, and it was only where the rocks came through the inner bottom that I could plug. From the pilot house on the side I constructed a house batter shutting the water out, and inside of that a wooden bulkhead.

"From there to the ship's stern, a distance of 40 feet, I built an inclosed coffer dam. Now, the two ends of the ship would be sufficient to float the ship and carry the middle part with the water, but the vessel was lying for 65 feet on the port bilge so

so close to the rock that you could not get your hand in between on either side. The great desideratum was to get her to come upright so that the men could slide in the collision shutter I invented for the purpose, and the four large collision mats kindly loaned by Rear Admiral Stephenson.

"After all this pumping we raised her eight degrees, but when the water came rushing in through these 65 feet of holes, and as we could not pump the Royal Roads dry, she went back to her old position. I had no idea the ship was damaged to the extent she was. Knowing now the injuries that have been done, I am satisfied that it is impossible to raise the vessel. The area of the holes I had filled up was 51,840 gallons per minute, but the snip is hung on the rocks which have pierced her between the ribs, and the girders from the hatches to the bottom are caught so that she cannot be moved."

The Steam Pumping Plant of the Future.

F. W. Dean, member of the American Society of Mechanical Engineers, recently prepared an exhaustive article on recent practice in pumping engines. Mr. Dean's investigations have led him to the conclusion that the most economical steam plant of the future will be designed as follows:

The boiler will be of the locomotive type, having a ratio of heating to grate surface of 75 or 80 to 1, working with over 200 lbs. of steam, having artificial draft and burning 30 or 40 lbs. of coal per square foot of grate per hour. This type of boiler is selected because it is the most economical of all boilers, either when forced or not, will stand the highest pressures, extreme forcing and general abuse without harm for many years. It is the pioneer of high pressures throughout the world, and its success under the most trying conditions shows it to be perfectly safe.

The engine used will be a moderately fast running vertical quadruple expansion furnished with steam superheated by the waste gases of the boiler. The cylinders will be steam jacketed, and the initial steam in the high-pressure cylinder may be wire-drawn considerably below the boiler pressure. There will be reheaters between the cylinders, the condensation from the working steam side of which will be passed through evaporators in the smoke flue of the boiler and returned to the most advantageous point of the engine.

The live steam should not evaporate any of this condensation, on account of the great amount of heat required, but should merely prevent condensation. The condensation from the live steam side of the reheater should be returned to the boiler. There will be a feed-water heater in the low-pressure exhaust pipe, and this water will have added to it the rejected heat of the auxiliary engines, if there are any, and will then pass through an economizer in the flue beyond the superheater and evaporator on its way to the boiler. The jacket condensation will pass to the boiler independently. The smoke-box end of the boilers will be near the engine in order to diminish the dissipation of the superheat of the steam which occurs very readily.

In the case of pumping engines the pumps will have a large valve area with many small automatic valves, or with few large automatic lifting and mechanical closing valves.

Large Guns for the Navy.

The experience of Great Britain and Italy has not tended to predispose our authorities in favor of exceptionally heavy ordnance. The 110-ton guns have been removed from Italian ships. The war vessels Indiana, Massachusetts and Oregon are each to be supplied with four 13-inch pieces. They are nearly 40 feet in length. The diameter at the breech is somewhat over 4 feet and at the muzzle 21 inches. The guns throw a projectile of 1100 pounds, with 550 pounds of powder as a charge.

G. W. PENNINGTON & SONS,
STEEL WORKS.
MANUFACTURERS OF
Best Refined Cast Tool Steel, Machinery and Hammer Steel,
Steel Piston Rods, Shear Blades, Lathe Spindles, and all kinds of Steel Forgings Made to Order.
REFINED BAR STEEL IN OCTAGON, ROUND, SQUARE OR FLAT, MADE IN SIZES AND LENGTHS TO ORDER.

723 MARKET ST., SAN FRANCISCO, CAL.
Open all year.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50.
ESTABLISHED 1864. Send for Circular.

Nevada Metallurgical Works,
NO. 23 STEVENSON STREET,
NEAR FIRST AND MARKET STS., SAN FRANCISCO.
C. A. LUCKHARDT, Manager.
ESTABLISHED 1869.
ORES WORKED BY ANY PROCESS.
ORES SAMPLED.
ASSAYING IN ALL ITS BRANCHES.
Assays of Ores, Minerals, Waters, Etc.
WORKING TESTS (PRACTICAL) MADE.
PLANS AND SPECIFICATIONS furnished for the most suitable process for working ores.
SPECIAL ATTENTION paid to examinations of mines; plans and reports furnished.
C. A. LUCKHARDT & CO.
(Formerly Huhn & Luckhardt),
MINING ENGINEERS & METALLURGISTS.

JULIUS H. STRIEDINGER, M. Am. Soc. C. E. OTTO VON GELDERN, M. Am. Soc. C. E.
STRIEDINGER & VON GELDERN,
CIVIL AND MINING ENGINEERS, TECHNICAL EXPERTS, LICENSED SURVEYORS.
Hereby announce that they are prepared to make the Examinations, Surveys, Technical Drawings, Estimates, and Reports required by the
CALIFORNIA DEBRIS COMMISSION,
Created by an Act of Congress, approved March 1, 1893, and to represent the petitioners before the Commission.
Address: 819 Market Street,
SAN FRANCISCO, CAL.

EVERETTE'S MINING OFFICE.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
Mining Law, Mine Examinations, Metallurgy.
ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES in any part of the world. Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will be honestly given.
DR. WILLIS E. EVERETTE, 1318 E. ST., Tacoma, State of Washington, U. S. A.

HEALD'S
BUSINESS COLLEGE.
24 POST STREET.....SAN FRANCISCO.
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. SEND FOR CIRCULAR. E. P. HEALD, Pres. O. S. HALEY, Sec.

THE RUSSELL PROCESS.
See Exhibit at World's Columbian Exposition, Chicago, Mining Building, Southwest Gallery, Location, Column 25B.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. No 220 Market St., San Francisco Cal.

Electricity.

Rapid Transit and The Advent.

Rev. A. J. Wheeler, pastor of the Advent Christian Church, of Boston, recently preached a sermon on "Rapid Transit." The pastor's idea appeared to be centered chiefly upon the fact that electricity and rapid transit are closely connected, taking from this a significance of the fulfillment of Old Testament prophecy. He read from Daniel, where it is said: "Many shall run to and fro, and knowledge shall increase," and upon similar prophecies he based his remarks.

"Rapid transit," said he, "is the fulfillment of God's prophecies. It was what he spoke of to those prophets thousands of years ago.

"Rapid transit is not simply for the development of commercial interests. I believe there is a divine economy interested with it.

"God has made these electric cars, these electric wires, His agency to fulfill the promise of that great day of days, when the trumpets shall sound and when the dead in Christ and those on the earth shall rise to meet Him.

"God has arranged everything for this day through this agency; the rails are laid, the wires are stretched. The lightning of the heavens shall meet with the lightnings of earth. He has made the earth ready for that day of the second coming, that we shall be ushered into the new kingdom. The wires, the cables are all slaves to Him, and when He bids them move they will bow to Him."

Cutting Fabrics by Electricity.

A new instrument has been devised that will cut fabrics of every description, of many thicknesses, with remarkable rapidity. The finest of linen is severed with the same ease as the firmest and coarsest goods, and a thickness of three inches and a half offers no obstacle to the progress of the cutting blade. The machine weighs about 35 pounds, and is 17 inches high and 8 inches in diameter. The cutter revolves at a speed of 2500 revolutions per minute, and is kept sharpened by a little attachment carrying a small emery wheel, which can be applied to the rapidly revolving knife at such an angle as to ensure a perfect cutting edge. The machine can be operated on any incandescent circuit, and is so simple that it cannot get out of order. Its operation entails no special training, and any novice can use it after an hour's instruction. It is no slight advantage to be able to operate an effective cloth cutter for less than three cents per working hour, which is said to be the actual rate of this machine. It is claimed that the machine will do the work of eight men, and, furtbermore, that in one house in New York, one machine alone is cutting 1000 dozen pairs of trousers per week of five and one-half working days. A lamp is attached to the machine, so that it can be used in dark lofts and on dark days. An instrument which is used to advantage in conjunction with this machine is the electrical sad-iron, the heating current for which can be instantly turned on or off.

For Protection of Passengers.

The New York State Board of Railroad Commissioners has sent a circular to every street service railroad in the State, recommending that every car operated by the electric trolley system in the State on a double track line be equipped with gates on both ends, and that only one gate—that opposite the other track on the rear platform—be open for the ingress and egress of passengers; also that no person, except an instructor when necessary, be allowed to ride on the platform with the motorman on any electric car. The board also recommends that on all open cars operated by the electrical trolley system on double tracked lines there shall be attached a guard on the side of the car next to the opposite track, running the entire length of the car, to prevent passengers entering or leaving the car on that side; this guard to be of such a nature that it may be transferred from one side to the other.

Forging Round Shapes.

The claim, according to an exchange, has been made by a Boston company of producing the first successful machine for electrically forging round shapes. The machine, which is designed and built for rapid and accurate work, is rotary in all its movements, and thus no time or power is lost in the return of the dies to their working position. Articles from one-half inch up to six inches long and from one-half to an inch in diameter can be turned out, meeting, in its capability, the production of the great variety of things now made of iron or steel, of low carbon, in order that they may be turned out economically. By this machine, however, it appears that highly carbonized steel may be worked equally as well as iron or soft steel, and it is within its range to roll successfully steel of the highest grade of crucible down to the open hearth and Bessemer; copper and brass are also satisfactorily worked. By this rolling process it is said that 100 perfect handles are capable of being made in the time required to make one by former methods. Anti-friction steel balls, from one-eighth to two inches in diameter, are likewise manufactured by this forging process at a speed otherwise unapproached. A red-hot steel bar is inserted between the revolving dies, and for every revolution of the dies a ball is forged, or a conical shot, a chair screw, a bolt with thread and head complete, a boiler rivet, a staple or taper pin, etc., are produced.

A New Electric Safety-Lamp.

Mr. C. N. Gauzantes, a French electrician, has invented an electric safety-lamp that in point of size and weight seems to be superior to any electric safety-lamp yet produced. In commenting on it, an English exchange says: "In size the lamp is 4 inches wide, 2 inches broad, and about 8 inches high. Its weight when fully charged is about 3 lbs. 12 oz., and it gives a light of ¾-candle power. The first cost of construction is only $1.25, and the weekly cost of replenishing the battery is only 11 cents, while so little wear and tear do the internal parts undergo that the life of the lamp is reckoned to be five years. The metal which serves as the anode of energy is refined by a new and simple process, and allows a maximum generation of current without fear of rapid polarization, which has up to the present time proved the great obstacle to the employment of the direct source of electricity. The fluid which serves as an exciter is a new combination, giving in a single liquid all the properties necessary for the production of a regular and constant current, not only from a dynamic point of view, but also in the re-absorption of the sulphates thereby produced. The new fluid can be manipulated without the slightest danger in either preparation or use. The lamp has been tested in Belgium by the firm which manufactures the great bulk of safety lamps for the north of France, and the opinion of the firm was distinctly that the lamp was a good one."

Electrically Welded Steel Barrels.

A large industry is being built up at Barrow, Eng., in the production of steel barrels for the conveyance of petroleum. The barrels are made in halves by means of a compression in a mold, when hot. Afterward they are welded together by means of electricity. The barrels are intended for use by large oil-carrying companies engaged in the oil trade in the East, where the temperature has a great effect on wood casks, and results in so much leakage.—American Engineer and Railroad Journal.

Diverging Apparatus for Search Lights.

Search lights have become indispensable to steamers of all classes, and in military and naval operations. By their use objects miles away can be revealed and illumined in the darkest night, and their powerful beams of light can be thrown in any direction. One of the earliest applications of the search light in marine work was to vessels passing through Suez canal. Formerly the passage could only be made in daylight, and was very tedious and costly; now the electric light is at the service of every ship as it enters the canal, and the journey is, in nearly every case, pursued uninterruptedly, says the Chicago *Journal of Commerce*. A most excellent innovation has been made by the Suez canal authorities, who have pronounced that it shall be obligatory, after October 1st next, on all vessels passing through the canal by night to employ an apparatus for dividing the light of the projector into two divergent rays. Approaching vessels may, by this means, travel right up to each other without their respective helmsmen being blinded. The diverging apparatus which is to be used has been devised by one of the agents of the company.

Useful Information.

New Substitute for Sugar.

Paschkis has recently given some attention to the properties of this new sweetening agent, and comes to the conclusion, with reference to its relative value as compared with sugar, that it cannot be denied that sucrol fully accomplishes one object for which sugar is used, viz., that of sweetening food and drinks. It has a pure, sweet taste, has no disagreeable taste accompanying or following its use, and does not spoil the food to which it is added.

Coffee, tea and lemonade that are sweetened with sucrol taste very good; their sweet taste never becomes disgusting or sickening. Sucrol is best used for sweetening liquids that have a comparatively high specific gravity. Those that are lighter and bitter will not have this taste covered by sucrol, on account of their want of viscosity and the small quantity of sucrol necessary for sweetening.

Something similar is known to be a fact with sugar; a purely bitter taste will not even be neutralized by much sugar (viz., quinine); it is only combined with the sweet. How much sweeter sucrol tastes than sugar cannot be stated exactly; according to his gustatory experience with aqueous solutions and with various foods and drinks, he believes it is about 200 times as sweet as sugar, maybe more. At all events, the quantity of sucrol necessary to sweeten a liquid is much too small to give it the same density as it possesses when sugar is employed. This shows very markedly in tea or coffee.—American Druggist.

The Opal.

There are three varieties of this famous gem. Ranking first comes the oriental; as second in value, the fire; and, lastly, the common opal. The affection for this treasure, as expressed by the ancients, can hardly be believed. Nonnius, a Roman senator, absolutely preferred exile to parting with a brilliant opal of the size of a filbert, which was earnestly coveted by Marc Antony. An opal ranking as third among the finest in the world is described as having three longitudinal bands of the harlequin kind, from the uppermost of which rose perpendicularly the most resplendent flames. It measured nine inches by six.

In the last century a very round and brilliant opal was the property of the amateur Fleury. Another, said to be fascinatingly vivid, was owned by a noted French financier. These two were regarded as marvels of beauty among gems. On account of the thousand fissures of the stone, engraving is always difficult and often impossible. A head of Sappho engraved upon a "presumable opal," an antique, has been highly valued and carefully studied by experts in gem lore. It is catalogued, so we read, among the treasures of a princely home.

Origin of Grain.

Nearly all the grains now in use are of unknown antiquity. Wheat was cultivated in all latitudes as far back in the past as we have authentic knowledge. Barley is thought to have originated in the Caucasus, but it was known and used everywhere in the most ancient times. Oats, like rye, was unknown in ancient India and Egypt and among the Hebrews. The Greeks and Romans received it from the north of Europe. Had there been an early civilization on the continent the wild oats found here and there would probably have developed into the useful cereal now considered absolutely essential to the proper nourishment of horses.

This continent is credited with having given Indian corn to the Old World, but this useful cereal was doubtless known in India and China many hundred years before the discovery of America. Cotton was used for making garments in India at a date so remote that it cannot even be guessed at. The fact is mentioned by Aristotle. The first seeds were brought to this country in 1621. In 1666 the culture is mentioned in the records of South Carolina. In 1736 the culture was general along the eastern coast of Maryland, and in 1776 we heard of it as far north as Cape May.

The Sun and the Stars.

The sun is a star, and the stars are suns. This fact has been a familiar one to astronomers for many years. That the stars shine by their own inherent light and not by light reflected from another body, like the planets of the solar system, may be easily proved.

That many of them at least are very similar to our own sun is clearly shown by several considerations. Three facts prove this conclusively. First, their great intrinsic brilliancy, compared with their small apparent diameter—a diameter so small that the highest powers of the largest telescope fail to show them as anything but mere points of light without measurable magnitude.

Second, their vast distance from the earth, a distance so great that the diameter of the earth's orbit dwindles almost to a point in comparison. This accounts satisfactorily for the first fact. Third, the spectroscope—that unerring instrument of modern research—shows that the light emitted by many of them is very similar to that radiated by the sun.

Their chemical and physical constitution is, therefore, probably analogous to that of our central luminary. The red stars certainly show spectra differing considerably from the solar spectrum, but these objects are comparatively rare, and may, perhaps, be considered as forming exceptions to the general rule.—Gentlemen's Magazine.

The Human Ear.

Few people realize what a wonderfully delicate piece of mechanism the human ear really is. That which we ordinarily designate as the "ear" is, after all, only the mere outer porch of a series of winding passages which lead from the world without to the world within. Certain of these passages are filled with liquid, besides having membranes stretched like parchment curtains across the corridor at different points. When a sound wave strikes these they are

thrown into vibrations and made to tremble like the head of a drum does when struck with a stick or with the fingers. Between two of these parchment-like curtains a chain of minute bones extends, which serves to tighten or relax the membranes and to communicate vibrations to them. In the innermost place of all, a row of white threads, called nerves, stretch like the strings of a piano from the last point from which the tremblings reach, passing thence inward to the brain.—Hall's Journal of Health.

To Take Foul Air Out of a Well.

The well was to be cleaned, but the man who took the job was afraid to go down until he had ascertained the quality of the air at the bottom. He let down a lighted candle, and when it descended to within six feet of the bottom it went out as suddenly as though extinguished by a whiff of air. That was all he wanted to know. He was then sure that the well had poisonous gas in it, and took a small umbrella, tied a string to the handle and lowered it open into the well. Having let it go nearly to the bottom, he drew it up, carried it a few feet from the well and upset it. He repeated this operation some 20 or 30 times, with all the bystanders laughing at him, then again lowered the light, which burned clear and bright even at the bottom. He then condescended to explain that the gas in the well was carbonic acid gas, which is heavier than air, and therefore could be brought in an umbrella just as so much water. It was a simple trick, yet perfectly effective.—Globe Democrat.

Automatic Bed.

A Bombay man has constructed a bedstead priced at 10,000 rupees, and I append the description for the benefit of my Birmingham readers: "It has at its four corners four full-sized gaudily dressed Grecian damsels, those at the head holding banjos, while those at the right and left foot hold fans. Beneath the cot is a musical box, which extends the whole length of the cot, and is capable of playing twelve charming airs. The music begins the moment the least pressure has been brought to bear from the top, which is created by one sleeping or sitting, and ceases the moment the individual rises. While the music is in progress the lady banjoists at the head manipulate the strings with their fingers and move their heads, while the two Grecian damsels at the bottom fan the sleeper to sleep. There is a button at the foot of the cot which, after a little pressure, brings about a cessation of music, if such be the desire of the occupant."—The Ironmonger.

New Ship-Saving Device.

An Englishman proposes to divide up a ship into air-tight compartments, the doors to which are fitted with proper packing. Then from each chamber a tube leads up on deck, all uniting with a "junction chest," connected with an air compressor. By this means, and with the aid of switches, the inventor believes it possible to force the water out of any compartment when the vessel has sprung a leak. In the switch-room there are to be electrical indicators which will reveal the presence of water in any part of the ship. By a modification of this device it is claimed a sunken vessel that has been suitably constructed can be raised by pumping in compressed air from above.

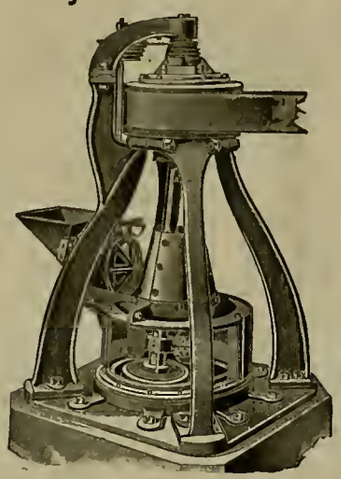
Queen of the Evening Sky.

Venus, after an absence of nearly a year, has again made her appearance as an evening star, and may now be seen for a short time in the early evening in the west. She will continue to adorn the western skies during the remainder of the year, growing brighter and brighter, and not reaching her greatest brilliancy until the 6th of January next.

THE GRIFFIN MILL

The Only Perfect Pulverizer

OF QUARTZ, GOLD OR SILVER ORES, PLUMBAGO, PORTLAND CEMENT,



OF PHOSPHATE ROCK, FOUNDRY FACINGS, And All Other Refractory Substances.

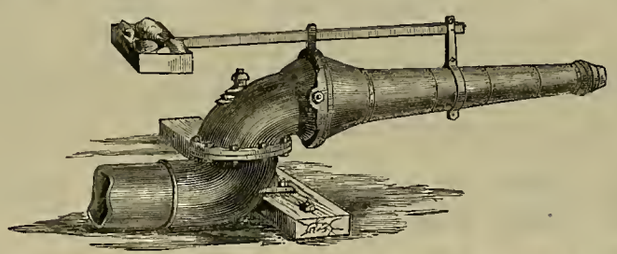
Will work either wet or dry, and deliver a finished product. Capacity, 3 to 4 tons per hour on Phosphate Rock, 1½ to 2 tons per hour on Portland Cement, Quartz or Ores, depending on hardness of material to be pulverized and fineness of product. Grinds from 30 to 250 Mesh with equal facility.

NO JOURNALS IN GRINDING CHAMBER. BALL RIGID ON SHAFT HAVING DIRECT POSITIVE ACTION ON MATERIAL. MINIMUM POWER PRODUCES MAXIMUM AMOUNT OF PRODUCT. IT IS ABSOLUTELY GUARANTEED IN EVERY RESPECT, BOTH AS TO CONSTRUCTION AND CAPACITY. FIRST COST, WEAR, AND OPERATING EXPENSE MUCH LESS THAN STAMP MILLS. LARGE NUMBER OF MILLS IN USE ON DIFFERENT MATERIALS WITH POSITIVE SUCCESS IN EVERY INSTANCE.

Correspondence solicited, and illustrated descriptive pamphlet furnished on application to

BRADLEY FERTILIZER CO., 92 State St., Boston, Mass.

IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINOLE-JOINTED style. The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

M.C.Co BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Dennfston's** Silver Plated Amalgam Plates The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charges; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assays; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION — JUST OUT.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

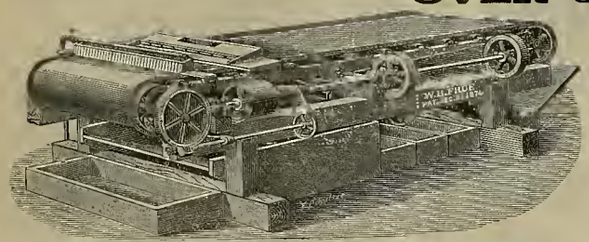
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

FRUE ORE CONCENTRATOR

OVER 8200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

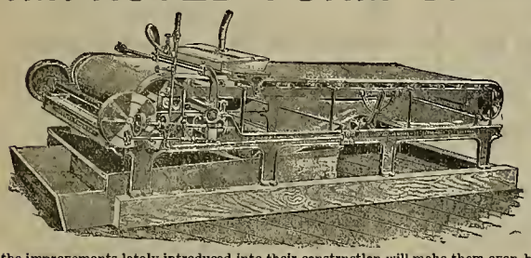
I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

Price of 4-foot wide Plain Belt Frue Vanner.....$550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.
No. 132 Market Street. - - San Francisco, Cal.

IMPROVED FORM OF "TRIUMPH" ORE CONCENTRATORS.



The annexed cut illustrates the **"TRIUMPH" CONCENTRATORS.** and shows the recent improvements which have been introduced into their construction, by which many advantages are gained over any other form of Vanners, Vanning Machines or Concentrators.

These advantages are obtained by reason of the fact, as will be observed, that the crank-shaft is now placed and fitted at the head of the Concentrator, clear of the belt and in direct view of the operator or attendant. This, of course, greatly facilitates the oiling of the bearings of the shaft and connecting rod and precludes the possibility of any sand or detritus, passing over the belt, from reaching or getting into the bearings.

The forms of the bearings and as well of the connecting-rod brasses have also been very much improved, making them stronger, simpler and more easy of adjustment. Important changes have also been made in the feed screw and quadrant for regulating the belt, with the view of making all parts of the machine stronger, more accessible and as easy of regulation as is possible.

We furnish the "TRIUMPH" Concentrators with either the plain or "Blasdel" Riffled Belt and shall be pleased to quote prices with the adaptation of either, as may be requested, and shall further be pleased to show one of the Improved form, set up ready for operation, at our office.

REDDING, CAL., April 22, 1893.

Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco, Cal.—Gentlemen:—Following the testimonial letter which I addressed to you December 9th, 1890, in relation to the superiority of the "Triumph" Concentrators over either the "Frue" Vanners or "Woodbury" Concentrators for concentrating our Texas ores, I hold now to the opinion then expressed; and with nearly two years and a half further experience in their operation I can confidently assert and am more fully convinced than then, that the "Triumph" Concentrators are better in all respects than any other form for concentrating our Texas and Bully Choop ores, and in evidence of such confidence I refer with pleasure to the order recently placed with you for four (4) of the "IMPROVED TRIUMPHS," to make up the complement required for use in the new twenty (20) stamp mill at the "Cleveland Consolidated Mining Co.'s mines in Bully Choop Mining District in Shasta and Trinity Counties, this State, and I feel assured that the improvements lately introduced into their construction will make them even better than the old form which I have had in operation for so many years past in the different mills under my supervision. I am, very truly,

(Signed) R. G. HART, Sr., Manager Texas and Cleveland Cons. Mining Co's.

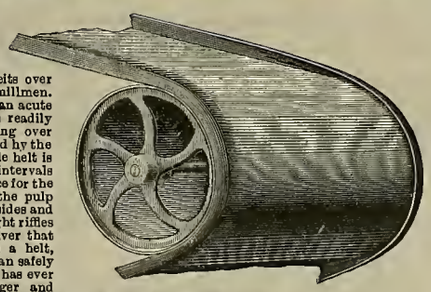
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

TUBBS CORDAGE CO.
(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice

611 & 613 Front St., San Francisco, Cal.

QUICKSILVER

—FOR SALE BY—

The Eureka Company of San Francisco,
Rooom 1,
426 CALIFORNIA ST., SAN FRANCISCO.

THOMAS PRICE & SON,

ASSAY OFFICE, SAMPLING WORKS,
AND
CHEMICAL LABORATORY,
524 Sacramento St.,
SAN FRANCISCO, - - - - CAL.

Coast Industrial Notes.

—Fires at the following places have destroyed property in varions amonnts: Biggs, $8000; Visalia, $1200; Boise (Idaho), $37,500; San Luis Obispo, $4000.

—The Blatchley sawmill, owned by Dolley, Rousseau & Co., at Sierraville, Cal., and 600,000 feet of lnmber were burned Sunday. Ths loss is $10,000; insurance $2000.

—The Pacific Mail Company has promulgated recent orders to cut down salaries all along the line. It ls a reduction of from 15 to 40 per cent. The cut is to go into effect September 1st.

—The Printers' Union at Victoria, B. C., bas reduced the scale for newspaper work ten per cent. Machine hands will get $22 per week; hand compositors, night, 45 cents per thousand; day, 40 cents.

—A movement is being made to form an electric-light company to furnish not less thsn 600 lights for Placerville, Cal. It will be incorporated, if sufficient subscriptione are obtained, with a capital stock of $10,000. Of the amount, $4000 must be subscribed. Chas. Green is eoliciting snbscriptions.

—Friday, Sept. 1, the Southern Pacific and the Santa Fe pnt a rate into effect to the Missouri river which will admit of a round-trip fare of $80 to Chicago, limited in time to 30 days east of the river and 60 days west. Notice to this effect hae been wired to the general passenger agents of all the mid-continent lines.

—The statement of the Southern Pacific Railroad Company shows that 2,897,870 pounds of freight were shipped from San Joss last week. Of this, 1,772,095 ponnds went East and 1,125,775 pounds to San Francisco and other points in California. The amount of green fruit sent East was 792,420 pounds and of new dried apricots 352,705 pounds.

—Commencing September 1st, the Southern Pacific will dispense with baggagemen on the Los Angeles division, between Los Angeles and Yuma, also probably on eome of the shorter rnns. Wells-Fargo express messengers will perform tbe work hitherto done by the baggagemen, the railroad company paying Wells-Fargo half the wages of the baggagemen.

—The Sbasta Lnmber Company have finished their railroad into choice engar pine lnmber, and things are very lively at the mill in Shasta county. Just now they are compelled to work a qnarter of a day overtime in order to fill their contracts for lnmber, and in view of the eteadily increasing demand they will put on a night crew at the sawmills on September 1st, thereby increasing their daily ent to 85,000 feet.

—The wages of workmen at the San Francisco slate quarry, Placerville, were reduced 20 per cent, and in consequence they all quit work. Slate-splitters have been receiving $3 psr day and ordinary quarrymen $2.50, and the redncotion makes these wages $2.40 and $2. E. Bind, the superintendent, has resigned. It is said that a new force of qnarrymen will be brought from San Francisco to carry on the operatione.

—A force of ship carpenters and joiners are at work on the steamer St. Paul, lying at Lombard-street pier. The steamer is to have extra staterooms, for the accommodation of cabin passengers, built on her, and will receive a thorough overhauling. The St. Panl is expected to be ready for service in ahout three weeks, and will then he placed on the run between this port and Mexican and Guatamalan ports, as far south as Champerico.

—Fire in the woolen mills at Merced Falls last week destroyed the mills, Nelson's flour mill, the warehouse belonging to the woolen mill, which held a large stock of goods, aud a residence owned hy Henry Nelson. The flonr mill was owned by John Ruddle, aud his loss is $25,000. The woolen mills were owned hy a San Francisco stock company, and the loss will amount to $150,000; about half insured. Thirty white men and forty Cbinese are thrown out of employment.

—Arrangements are ahout perfected for the establishment of a Roman Catholic convent and college at Pasadena. Plane for the convent are completed. A church will be built elsewhere. The college will represent an expenditure of $75,000 and will he erected hy the Redemptorists, an order of priests with headquarters at Milwaukee. It is proposed to locate the college on a commanding site at Altadena, north of Pasadena, on the line of the Mount Lowe railway. Work on the convent will begin eoon.

—The stockholders of the North Beach and Mission Railway Co. have authorized the directors to create a bonded indebteduess to the amonnt of $2,000,000, for the purpoas of making needed repairs. The motive power to be used has not as yet been definitsly decided upon, but in all probability electricity will be chosen. Tbe bonds will not bs placed npon the market for some time to coms, as a nnmbsr of preliminaries have to bs arranged, which will increase ths valns of ths property, in order to more thoronghly substantiate the loan.

—At a meeting of the Board of Supervisors of Berksley, Monday, a petition was presented signed by over 250 property-owners of Berkeley remonstrating against the removal of the Judson Powdsr Works, as has lately bssn pstitioned hy citizens of Bsrkeley. The signere of thia petition etate that they believe tbat all necessary precautions had been taken for safety by tbe Judson Dynamite Powder Company, and reqnest that the plant be snffered to remain where it is. The petition represents that the company employs a large force of men and disburses a considerable amount of money in wages.

—Sacramento has entered into a contract with A. L. Fish of San Francisco for construction of new water works. By the terme of the contract Fish is to supply the city with pure water from artesian welle at the rate of 3 1-10 cents per 1000 gallons. If the water is not up to the plans and specifications, the contract is rescinded. He is to put in a 30-inch main through the city at his own expense. This and and the erection of the plant means an expenditnre of between $80,000 and $100,000. The city will regulate and collect from consumers as now, merely bnying the water at wholesale from Mr. Fish. The contract can be ended at any time, and mnst be terminated at the completion of 30 years. At the close of 20 years the city can purchase the entire plant at a valuation to be fixed by arbitration, but not to exceed $300,000.

—The salmon pack of Frazer river for 1893 is abont as follows: Beaver cannery, 17,500; Wellington Canning Company, 15,000; Delta Canning Company, 15,000; Holly cannery, 15,000; Laidlaw's, 15,000; Harlock Packing Company, 15,000; Deas Island cannery, 10,000; Ewen's cannery, 40,000; Phœnix cannery, Brittania cannerv, Wadhame' cannery, Canoe Pass cannery, British American cannery and Birrell'e cannery, 103,700; Lnln Island Canning Company, 20,000; Pacific Coast Packing Company, 16,000; Imperial Canning Company, 16,000; Brunswick Packing Company, 16,000; Munn'e Sea Island cannery, 20,000; Stevenson Canning Company, 20,000; Canadian Pacific Canning Company, 20,000; Bon Accord cannery, 20,000; Terra Nova cannery, 15,000; Richmond cannery, 16,000. Total, 425,200. The pack already is the largest ever pnt up on the Frazer by abont 75,000 cases.

—The Navarro Mill Co. has been adjndicated insolvent, npon a petition presented in the name of the company. Sheriff McDade has been appointed receiver, nnder honds of $20,000. Thnrsday, Ssptember 28th, ie fixsd for the holding of a creditors' meeting, at which an assignee will be selected. The petition in insolvency is signed hy J. Fessenden Clark, the company's vice-president. He sets the liabilities of the concern at $1,038,719.85, which sum is divided up in the following manner: Open accouuts, $58,708.92; accepted drafts, $17,582.62; unaccepted drafts, $4,225.22; notes, $444,466.86; indorsements, $13,616.23; bonds eold, $1120; bonds pledged, $499,000. The creditors of the unfortunate company are very nnmerous, and while some accounts are hut small, there are others that amount to a very large percentage of the liabilities.

—The West Coast Plumbing and Supply Co. of San Francisco has failed under douhtful circumstances. The company was managed by L. D. Arnold, who organized it. With him were associated James A. Maguire and Fletcher F. Ryer, son of the millionaire who left him $250,000. The company closed the doors of its place at 58 First street on Augnst 1st. Arnold has disappeared, and his brother says he has gone East to effect a settlement with creditors. The shortage in the company is given at $40,000, owed mainly to Esstern firms. The principal creditors are: Eaton, Cole & Burnheim of New York, to whom the West Coast Plumbing and Supply Co. owed $6000; the L. M. Rnmsey Manufacturing Co., which has a hill for $4000; and the J. L. Mott Iron Works of New York, with $4500 on its hooks against Arnold and his associates. The Heep Manufacturing Co. is another creditor, aud Oscar S. Levy of 205 and 207 Market street holds a number of other claims aggregating nearly $1000.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MINE BONDED.—*Record*, Aug. 24: Ths Bell-Weather miue has been bonded to an Eastern company. At the Pionesr mine hoisting works hava been pnt up and it is proposed to sink a shaft 1000 feet before stoping is begun. The Zeile mine at Jackson employs 125 men. The ledge is 35 feet wide of low grade ore. Over $20,000 has been expended this year in repairs to shafts. At the South Eureka mine they have stopped sinking and are now engaged in opening np a level and drifting for the contact, which they will reach in abont 180 feet and probahly a month's time. D. Gntman the energetic mining operator, says this company has begun active operations on the Mattley Hill mine, adjacent to the Irma property, and will develop it on an extensive scale.

AT THE ALMA.—*Ledger*: The Alma people have commenced work at their mine site. During the week the superintendent, J. B. Francis, contracted for timbers with Lessley'e mill, and as soon as the necessary timbers are on the gronnd sinking will be commenced with a windlass. By the time 50 feet is reached they expect to have a hoist on the ground. They have decided to put in a eteam hoist, believing steam to be as oheap as water for power. . . . Snrveyor Reeves and B. F. Taylor spent a portion of this week snrveying the Argonant mine to determine the best pitch for the shaft and other data before commencing their einking on an elahorate scale.

Butte.

STRUCK A BONANZA.—Oroville *Mercury*, Aug. 24: The quartz ledge recently discovered by Messrs. English and Parks at Bangor, still continnes to prove of almost marvelons richness. The ledge is about two feet wide, is worked by a tunnel, and the ore crusher is a hand mortar. In fact, the vein is almost pure gold. In the last five days the owners have pounded ont by thie method $5184. Yesterday they extracted over four pounds of gold and the ledge shows no signs of giving out. Since its discovery the owners have taken out a fortune, and at the present rate will soon be independently rich. It is one of the biggest bonanzas ever strnck in the county.

A LIVELY CAMP.—Oroville *Mercury*, Aug. 29: Forbestown is now a typical California mining camp. It ie situated at the junction of two ravines, with only two or three hundred yards of level land to build on, while from all around slope precipitons hills. The narrow, level strip was the site of the old town, but now that new enterprises have necessitated the constrnction of new buildings, the hills are being utilized and houses are being erected in places which, to the resident of the valley, would eeem almost inaccessible. Bnt they are being built and there are not enongh to afford shelter to the inhabitants, and occasionally one sees a family living in a tent pitched beneath the pines. Within a year the town has more than doubled in population. It is the Mecca for every man looking for work, and there is consequently a large floating population. The three principal mines employ something over 200 men, while there are about 100 more working in the woods and on hnildings. The town now consiets of three hotels, three general merchandise etores, four saloons and a brewery, besides fruit and confectionery stores, barber shops, a drng store and photograph galleries, meat market, and several other smaller concerns. There are three large quartz properties being worked which have a total of 80 stamps, and two large reduction works. The hills are full of prospectors, and several more ledges are being opened. Taken altogether, Forbestown is now the liveliest camp in northern California, and indications are that it will continne so to be.

Calaveras.

A VALUABLE MINE.—Angels *Echo*: The Adelaide mine situated at Robinson'e Ferry, owned by Harvey Wood and sons, is heing steadily worked and hids fair to take rank with the richest mines in this section. Specimene of the ore taken from the mine recently are very rich. This mine has from time to time yielded large sums of gold.

THE JONES MINE.—*Echo*: The mill on the Jones mine situated at the mouth of Carson creek is kept continually running. The company is going to add 20 more stamps to the mill immediately. Mr. Roberts, the superintendent, tells us that the main shaft ie 250 feet deep, and levels are heing rnn at that depth. Sinking will be commenced in the near future.

El Dorado.

RENEWED ACTIVITY.—*Democrat*: There seems to he a renewed activity in mining operations throughont the county, which meaus prosperity and a general henefit to all. C. D. Lane was over from Angel's Camp last week and is pushing work on the Oro Fino. Chas. A. Bishop, of Portland, Or., ls making arrangements to open the Daly mine, near Grizzly Flat, in the near future, aud Frank Staples, hacked hy San Francisco parties, has commenced work on the Minnehaha mine, near Logtown, formerly known as the Capital mine. He has purchased the mill and machinery on the old Greenstone and has a numher of men already at work. A. D. Staples, near the same place, is at work on an extension of the old Pocahontas, and has a shaft down about 60 feet, taking out some fine-looking quartz, rich in free gold. He hae had several opportunities to hond thie mine, hut thinks he has a good thing and prefers to keep a controlling interest.

Mariposa.

FAST TIME.—Red Cloud Mins Cor. Mariposa *Gazette*: On Ssturday evening last the smployes gave an entertainment and dance to their many friends abont hsre to cslebrate tha event and completion of sinking the shaft in this mine another 100 fset, which was accomplished in the unprecedented time of 54 days, by six miners working 50 days on eight-hour shifts, two miners working two days on 10-honr shifts, and four miners working two days on 10-honr shifts; total, just 54 days, and with this additional 100 feet the shaft is now 700 feet in depth. At no plaes in ths sinking of ths 100 feet is the shaft in dimsnsions less than 8x10 feet, and in many places mnch larger, as the vein mattsr increased in places to 14 feet wide. Ths rock all the distance remained uniformly hard as at any other place in shaft, above, and every inch was blasting ground.

Mendocino.

COAL DEPOSITS.—Ukiah dispatch, Aug. 25: J. W. Miller, of thie city, arrived from Redwood valley to-day and reports the discovery on the Hargis place, ten miles from Ukiah, of a eix-foot vein of anthracite coal. The place was bonded some months ago by Dennie Quinleven, an old Pennsylvania coal miner. The shaft was down 30 feet when the vein was encountered, and the prospects of an extensiva deposit more than meets the expectations of Mr. Quinleven. The mine ie eituated on tbe right bank of Russian river and directly on the line of the proposed extension of the San Francisco & North Pacifio railway.

Mono.

LEDGE OF ONYX.—Bridgeport *Chronicle-Union*: W. E. Lindsey has located a claim 600x1500 feet on a ledge near Allen's Hot Springs, half a mile from Bridgeport, from which he has taken some fine pieces of onyx, of whioh there is an nnlimited quantity. Specimens are very fine. One large piece which he partially polished would make a beantifnl table top.

Nevada.

FINE CLEAN-UP.—*Union*: A splendid clean-up of 28 loads of ore has just been made from the Norambagua mine, Forest Springs, the ore yielding at the rate of $27 to the load, making an aggregate for the whole crushing of $756. The qnartz now being extracted looke better than that just crushed, and it is estimated that it will pay close on to $50 to the load. The ledge, though comparatively small, varying from 6 to 17 inches in sizs, is rich mining ore. Tha Noramhagua is owned principally by Wm. Campbell, the well-known Boston Ravine merchant.

GOON SHOWING.—*Telegraph*, Aug. 25: Mr. Thomas, who has a bond on the Spring Hill mine, and who is now taking ont ore from the ledge, to-day bronght to town 30 ounces of amalgam, the result of a crushing of about six loads of ore from the mine. About 1000 tons of ore on the dnmp are awaiting the mill. The rock will be crushed at the Crown Point mill.

THE YUBA MINE.—*Telegraph*, Aug. 23: The Yuha mine, in Washington district, after remaining idle quite awhile, is to be worked again soon. Superintendent Webber and Jamee Gribble, foreman, are now at the mine and had preparatory work begnn Monday. The pnmps will be put back and the water pnmped out of the mine, after which regular operations will be resnmed.

MINE BONDED.—Nevada *Telegraph*, Aug. 23: John C. Roberts has bonded the old Kate Haye Hill mine (now called the Oregon) and work of clearing the shaft, preparatory to active operations, will commence immediately. No active mining has heen done ou the Kate Hays Hill mine since 1866, and np to that time the ledge has yielded npwards of $90,000. The shaft is down about 240 feet and the ledge varies in eize from 10 inches to 4 feet, the average width being ahout 2½ feet.

PUMP STARTED.—*Telegraph*, Aug. 23: Superintendent George Mainhart informs ns that the pump at the Lone Jack mine was started this afternoon. The work of einking the shaft will he immediately commenced, and it will not he very long before the 1500-foot level will he reached.

GOOD GRAVEL MINE.—*Herald*: The Union Company, at Relief Hill, has as fine a gravel mine as can be found on the ridge. It has a great deal of ground opened up, and is still prospecting. The property is a paying one.

RICH SULPHURETS.—*Herald*: The Bellefontaine mine is turning out some heavily sulphuretted ore, said to be worth upwards of $200 per ton, and 20 tons of it are to he ehipped to the Selhy emelting works for reduction. Ten tons will be ready for shipment by the last of this week. The rock is so rich that some free gold can be seen in the snlphnrets, and it is really very fine ore.

STRUCK GOON ROCK.—*Transcript*, Aug. 20: The shaft at the Reward mine is down between 120 and 130 feet, and is being sunk as rapidly as possible. A good ledge of quartz has been struck, the rock showing free gold and being well charged with sulphnrets. It is the intention to sink the shaft 300 feet without etopping. When a depth of 200 feet is reached a level will he opsned up, and the working force will then be increassd.

NEW ENTEEPEISE.—*Transcript*, Aug. 20: What promises to prove an important mining venture is soon to be inaugurated on Sweetland creek, not far from the town of Sweetland. Hon. R. I. Thomas of Birchville, J. J. Ott and L. P. Schmidt of this city, and a gentleman of Sweetland, have made a location of 3000 fset on Sweetland creek. The claim is a continuation of the well-known Boss ledge. It is an immense deposit, similar in character to the famous Spanish mine at Washington. The ledge matter is composed of decomposed qnartz,

talc and ochre, and is 40 feet wide. Milling tests have been made from different portions of it and the results have been highly satisfactory. The owners will put a Huntington mill and other machinery on the mine before long.

Plumas.

PRODUCING BULLION.—*National-Bulletin*, Aug. 24: The Johnny Bull mine, owned and operated by Sam Firmstone and others, has been producing bullion of late in most satisfactory quantities. The mill has only five stamps, but during last month $2030 was realized from the cleanup, the ore yielding from $10 to $11 per ton. Crushing is in progress this month on equally as good ore. This is a very good showing for a small mine which can be operated with four or five men and little expense outside of the employment of these.

San Bernardino.

THE YUMA PLACERS.—San Bernardino dispatch, Aug. 18: About September 1st a large English company, together with several home capitalists, including Wilbur and Chandler, and A. Caldwell of Riverside and L. C. Moreland, will begin working the placer claims about 15 miles above Yuma, on the California side of the Colorado river. Immense pumping works have been erected—one on the banks of the river, with 500-horse power, which will raise a large stream of water to the high bluffs above, from where it will be conveyed in steel pipes to the placer mines, four miles away. After the water is used once, it will be again pumped back by a second pumping plant and used over and over again. The plant is completed except for the laying of the pipe line. It is thought that about 300 men will be employed on the day and night shifts. Contracts for labor are being made.

Shasta.

IMPROVEMENT AT SHASTA.—*Democrat*: Jim Hill says the mines around the old town of Shasta are improving right along, and several good properties are developing finely. Mr. Fitch, the gentleman from Santa Cruz who was in the county a month ago, and who bought the mine on the head of Middle creek, about a mile from Shasta, owned by the Drury Bros., will be in Shasta in about ten days, and intends to erect a custom quartz mill at Shasta, in the south end of town.

THE POOTEM MINES.—*Democrat*: W. A. Montgomery, writing to us from Pootem creek, has the following to say about the mines there: "I feel warranted in saying that I believe Mr. Bowley has one of the finest mines here in the State, and I consider it very valuable property and believe it will be worth half a million dollars or more when it is developed. The road is within three miles of the mine, and it will be completed in three weeks, and by that time the ferryboat will be running. Then Mr. Bowley can get his supplies in."

Siskiyou.

GOOD LEDGE FOUND.—Yreka *Journal*, Aug. 23: Kiernan & Dale are still prospecting their quartz ledge in Butte district, at the headwaters of Shasta river, and feel confident that they have a valuable permanent ledge of two to three feet thick, with an abundance of water close at hand for running the quartz mill and washing out the gold, also plenty of timber for building and firewood. Other parties are working locations in the same vicinity, with favorable indications of success, to make that section one of the richest quartz-mining districts in the county. K. McPherson, who has been prospecting on Greenhorn for some time past, has a small rich ledge, from which he realizes good pay by the slow process of pounding the quartz in a mortar. He has been troubled with the la grippe lately, so that he has not been able to do much work. He is in hopes of eventually finding the ledge much wider and permanent, as he sinks down, to justify putting up a mill. John Napper, who has a good paying claim on Trail gulch, Humbug creek, alongside of the grade from the summit of the mountain to Humbug crossing, is now building a good ditch from the gulch to his claim, so as to be in readiness for securing the gulch water when the winter storms commence. The Bellevue quartz mine at Salmon river, near Sawyer's Bar, has been yielding good average pay right along, ranging from $37.50 to $45 per ton. It is owned by C. Nicolet, an enterprising and persevering miner, who crushes the quartz in an ingenious arrastre rigged up by himself. The ledge varies from two to three feet in width, from which over 400 tons has already been taken out. He is sinking down on the lode, and feels hopeful of striking one of the largest and best-paying ledges on the coast.

RICH QUARTZ.—Yreka *Journal*, August 30: Dale & Co. still continue to find rich quartz in their ledge on the head of Shasta river, about 6½ miles west of Igerna. The lode ranges from 30 to 36 inches in width, and exhibits gold in good quantity to the naked eye. They are now building an arrastre for crushing and are making arrangements to put up buildings and get ready for winter work, so that the heavy snows in that section may not interfere with sinking shafts and tunneling. An expert has been sent to the mine from San Francisco by J. D. Frye, the well-known mining operator, with instructions to purchase, if possible. Dale & Co. have come to no conclusion yet what they would be willing to accept. J. Cavanaugh, of Edgewood, has located a ledge near Dale & Co., and placed three men at work for a thorough prospecting. The Greenhorn blue gravel mine, near Yreka, still continues to show good prospects, but the hot weather has dried up the water supply so that very little washing can be effected. As soon as the winter storms commence a large force can be employed to good advantage with the certainty of realizing a great amount of gold-dust every day. Mr. Sterns, the mining man, operating on south fork of Scott river, has bonded J. H. Pollard's mine at that place, and will give a thorough test in developing it. The Spencer quartz mine, on Siskiyou mountain, near Cole's railway station, continues to pay well, this quartz taken out yielding an average of $35 to the ton. The miners on Klamath river, in the Honolulu district, are now getting down to the bedrock in good shape, the storms of May and June having delayed commencement until later than usual for river mining. From this time on we may anticipate large returns of the glittering ore at every cut to the bedrock bottom of the old channels.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Virginia *Chronicle*, Aug. 26: 1500 level—From the upraise started in the main south drift on the sill floor of this level, at a point 256 feet distant from the main shaft, a west drift has been started 52 feet above the sill floor and advanced 20 feet, connecting with the east drift from the bottom of the winze, sunk from the southwest drift from a point 75 feet above the sill floor. From the west drift a south drift has been advanced 50 feet. All these openings are in quartz formation averaging $5 per ton. 1600 level—The south drift started at the end of the east crosscut run from the main south drift at a point where it connects with the upraise carried up to the north drift on the 1500 level has been extended 7 feet; total length, 111 feet; continuing in porphyry and quartz of a very low assay value. From the end of this south drift an east crosscut has been started and advanced 21 feet in clay and quartz formation. 1650 level—Have continued making necessary repairs to the drifts on the sill floor of this level; and from the two sides of the drift run east (at a point 20 feet down) from the winze sunk from the crosscut run west from the main northwest drift; and from the end of the drift (in working upward) run south from that winze at a point 52 feet down, we have extracted during the week 427 carloads of ore—about 420 tons. Have shipped to Morgan mill during the week 417 1950-2000 tons of ore, the average assay value of which (per car samples) was $32.08 per ton. The average assay value (per battery samples) of all the ore worked at the mill during the week (383 tons) was $26.60 per ton. Bullion shipped to Carson Mint, assay value, $14,670.51.

OPHIR.—1565 level—The east crosscut started from the main drift on the sill floor of this level, at a point 108 feet south from the winze station, has been advanced 15 feet; total length, 55 feet; in a hard porphyry formation. Have raised to the surface 18 tons of ore, which had been stored in a drift on this level. Average assay value, $17.44 per ton.

MEXICAN.—On the 1565 level—The east crosscut from the north drift from the crosscut run east from the bottom of the winze, sunk from the 1465 level down to this level, near the south boundary line of the mine, has been extended 25 feet; total length, 227 feet, continuing in harder porphyry formation.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 10 feet, making the total length 553 feet; the last 170 feet being in a mixture of quartz and porphyry; the face is now in hard rock. The joint Sierra Nevada and Union north drift from the west drift, 1520 feet west of the joint shaft, 900 level, is out a total distance of 93 feet; face in clay and porphyry.

POTOSI.—The east crosscut from the south drift, 220 feet south of the shaft, 850 level, is out 45 feet; face is in soft porphyry and streaks of low-grade quartz. The east drift, 73 feet above the 930 level, has been connected with top of north raise from 930 level; total length of drift, 155 feet. Extracted and sent to the mill the past week 336 tons of ore from the 930, 1000 and 1150 levels. Milled during the week 336 tons. On hand at mill 100 tons and 1950 pounds. Average battery assays, $25.30; average car-sample assays, $33.83.

CHOLLAR.—The north drift from the west crosscut, 930 level, is out 50 feet; face is in porphyry. From the face of this drift have started a crosscut west, which is now out 15 feet; face is in soft porphyry.

WARD SHAFT.—The west drift from the station, 820 level, is out 90 feet from the shaft; face is in clay and porphyry.

EXCHEQUER.—The west drift from the station, 820 level, Ward shaft, is out 90 feet from the shaft; face is in clay and porphyry.

BULLION.—The west drift from the station, 820 level, Ward shaft, is out 90 feet from the shaft; face is in clay and porphyry.

ALPHA.—The west drift from the station, 820 level, Ward shaft, is out 90 feet from the shaft; face is in clay and porphyry.

OCCIDENTAL.—We continue to extract from the west ledge on the 350 and 400 levels from four to five tons of ore per day of the average assay value of $27 per ton, as per car samples.

KENTUCK.—From the stopes above the track floor on the 1100 level we have extracted and shipped to the Santiago mill about 25 tons of ore per day of the average assay value, as per car samples, of $8 per ton in gold. The south drift from the joint east crosscut, on same level, is in 41 feet; face in low-grade ore, with branches of good ore.

HALE & NORCROSS.—On 900 level the west crosscut No. 1 from south drift was advanced 10 feet; total length, 62 feet; face in porphyry. 1300 level—Are cutting out a winze station north of the shaft on this level, preparatory to starting a new winze on the ledge. The preliminary work has disclosed fair-grade ore, which this winze will follow. Sinking will be commenced early in the coming week.

BEST & BELCHER.—200 level—West crosscut No. 3, started in northwest drift, 295 feet from our south boundary, has been extended 18 feet, passing through porphyry, clay and quartz. 900 level—West crosscut No. 5, started in southwest drift, 100 feet from west crosscut No. 4, has been advanced 13 feet; total length, 89 feet; face in hard porphyry.

GOULD & CUREY.—200 level—West crosscut No. 5, started in northwest drift, 432 feet from main west drift, has been extended 16 feet; total length, 602 feet; face in hard porphyry. At a point in west crosscut No. 5, 50 feet from northwest drift, we have started a south drift in a face of quartz giving low assays; this drift was advanced 12 feet during the week.

Silver Peak District.

THE SILVER PEAK MINES.—Walker Lake *Bulletin*, August 23: The party of experts and capitalists who have been examining the Silver Peak mines are satisfied that there is an immense quantity of low-grade ore in the mines, but they think that the price asked ($500,000) is exceseive, because that much more must be expended in building mills, tramways, securing water, etc. If they can come to terms with the owners of the property, they will work the mines on a large scale, giving employment to 500 or 600 men.

Pine Grove District.

GOOD PROSPECT.—Walker Lake *Bulletin*, Aug. 23: H. Norton and J. H. Rae are working a mine near Pine Grove. They have ont quite a quantity of ore that is now being hanled to the Gignonx mill for crushing. The mine is a gold producer. From a small quantity of ore worked at the Douglass mill a few weeks ago a little over $40 per ton was received.

ARIZONA.

THE YARNELL CAMP.—Prescott *Courier*: Wm. Robinson, recently returned from the Virginia Gold Mining and Milling Company's properties, reports that their Yarnell camp now presents an unusual scene of activity. Forty-five men are now at work and more men being put on; the mill is being run steadily on ore from a ledge recently struck in the lower drift, about 100 feet from the top of the mountain of ore; this is of higher grade than that previously worked. The main tunnel is still being pushed. The starting up of this prosperous camp, so near Prescott, is one of the most favorable signs of the times hereabouts. Miners say the amount of milling ore in sight is something enormous and inexhaustible.

A PROGRESSIVE DISTRICT.—*Southwest Sentinel*, Aug. 24: The strike which was made in the Pyramid Company's mine recently is showing up very well as development progresses. It is the most important strike ever made in the district. There are several mines in the Tres Hermanas district which will be worked as soon as a little better price can be obtained for silver. Some very fine bodies of silver-bearing lead ore have been exposed in that district and a good many men would have been at work there had it not been for the low price which has been paid for silver recently. Placer miners are having better success in the placer mines of this county this year than they have had before since the discovery of gold in the Pinos Altos district. There is little reason to doubt that the water supply will hold out for several weeks yet. The new mill which is being erected at Pinos Altos to treat ore from the Mountain Key mine will be completed soon and then the force at the mine will be increased. There are now about 20 men employed there. At Cook's Peak preparations are being made to work the Flower Queen. Repeated attempts have been made to work this mine, but the ore contains so much zinc that no very satisfactory results have been obtained. Pinos Altos is now one of the busiest camps in the Territory. The mills are running on full time and there is plenty of water to keep them going for the remainder of the year. More men are employed in the mines than have been employed there at any time since the closing down of the Pacific Gold Company's mine and mill and there are no idle men in the district. Considerable prospecting is going on out in the Burro mountains. There is an excellent prospect that there will be some very good gold mines opened there this year. Turquoise mining in the Burro mountains is attracting considerable attention just at present. Several new locations have been made recently and others are being developed. The stones found are generally of very fair quality, though many of them are a little off color.

BEING ENLARGED.—Globe *Silver Belt*: The Mammoth Gold Mining Company's mill on the San Pedro is being enlarged to 100 stamps. Experiments with the Raber process have proved very satisfactory. All the tailings can be worked by this process and a large amount of gold saved. It is estimated that the old process saved only 40 per cent of the gold, while the new one will extract 90 per cent.

BIG BUG DISTRICT.—Prescott *Courier*: Few people in Prescott know that within 24 miles of this city is a prosperous and rapidly growing gold-mining camp, with a population almost exclusively of working miners, numbering, according to different estimates, from 300 to 500. Such is Big Bug district, the foremost gold camp in northern Arizona at present, where the early riser hears the whistle of no less than six quartz reduction works, which are all within a radius of three miles.

IDAHO.

SNAKE RIVER PLACERS.—Placer mining on the Snake river, in Idaho, bids fair to develop into a growing industry. The Pocatello *Tribune* tells of a prospector who has been working near American Falls with a gold-saving machine of his own invention, and one that promises to make the banks of Snake river alive with prosperous miners. The machine is an inexpensive one (costs about $150) and one man can work it. He has at present only one of these machines at work, but is now preparing to get 20 more on the ground at once and will then put from 20 to 25 men to work at once. It is claimed that each machine will save $100 worth of gold a day.

OREGON.

MUCH PROSPECTING.—Brownton Cor. Josephine *Courier*: Most of the miners are about through cleaning up for the season, and although they do not laugh over the outcome or report any big thing, they try to be satisfied and hopeful for the coming winter. Crosby & Hopkins have struck what they think is the old Cowen lode. The rock prospects fairly. Although the vein matter is but small, it may open up better as they go down. W. A. Johnson has commenced sinking on his location. The ledge is quite large and looks very favorable. Dicky is now working with the Briggs & Doney Company on McDonna gulch. This company are getting their ditches in shape for a long season's run. I have not heard from Sucker Creek basin, except that the men are all at work and quite sanguine of making a big run and cleanup.

CLEANING UP.—Jacksonville *Times*, Aug. 18: The Sterling Mining Co. is engaged in cleaning up, and the prospects for a good yield are excellent. A. W. Sturgis, of Jackass district, has finished this season's work and made a big cleanup, running well up into the thousands. It is said that a genuine fissure vein has been struck at Dr. Hinkle's mines in Sardine Creek district. The ore prospects very well. Simmons, Cameron & Co., who are operating an extensive mining claim in Waldo district, Josephine county, have finished cleaning up and realized handsomely from the past season's work. The placer mines of Jackson and Josephine counties yielded better during the past season than for years past. Many thousands of dollars of gold have been put into circulation during the past few months. W. H. Hampton, the well-known mineralogist-negotiated the sale of the Dysert mining property in Grave Creek district to Portland capitalists, and is taking steps to acquire adjoining placer mines. It is the intention to incorporate a stock company and inaugurate a big mining enterprise.

CROWNING WORK.—Ashland *Tidings*, Aug. 18: Col. Thos. Ewing returned Tuesday morning from Seattle, to look after his mining operations, and is crowding work upon the prospect tunnel at the Mountain Lion mine. . . Geo. F. Gund, of Seattle, with whom Lon Edwards is interested in mining investments, arrived last Saturday and spent several days visiting, with Mr. Edwards, the several mines where they have prospect work in operation. Mr. Gund is well satisfied with the prospects, and expects to spend more time here during the fall. The Anderson land at Wagner Creek Gap, the St. Patrick claim owned by Jos. A. Wilson, the Park ledge owned by Vannatta and others, and the Hope mine, are some of the properties bonded by Gund & Edwards. . . Beagle & Brunk have bought a placer claim of a Chinaman on Gronse creek, just above the Patterson mine. They already had the Beagle claim on Beaver, just below the Patterson mine. Charles Cowles and a partner have located a placer claim on Mt. Sterling, below Flett's mine, and will prospect it this fall. . . Tom Hurd reports that Jack Morris has just worked up a $700 pocket of gold quartz in the Blackwell district. Morris has made a scientific study of this sort of mining, and has found and worked 13 pockets in that region within the last six years, from which he is several thousand dollars ahead.

CLEANING UP.—Jacksonville *Times*, Aug. 25: The Sterling Mining Co. is engaged in cleaning up, and the prospects for a good yield are excellent. The Mountain Lion mine in Missouri Flat district has been bonded to John H. Simons for $12,000. Work on the Clark mine in Williams Creek district will soon be resumed, Portland parties having purchased it. Prospectors still continue to be numerous and a great deal of prospecting is being done in Jackson and Josephine counties. Messrs. Burke & Drew, who purchased a mine in Jump-Off-Joe district, are expected to return in a few days with machinery to work the mine. F. Grob and J. Nunan, representing Joe Braendle, this week bonded their quartz mine in Jackson Creek district to Fred Hogg, Judge Holcomb and others. The placer mines on Wolf and Grave creeks have paid better this season than for a long time past. It is said that at least $10,000 will be cleaned up at the Ruble mine.

GREEN HORN DISTRICT.—Word comes from the Greenhorn district that the mines continue to improve as development work progresses, says the *Democrat* of Baker City, Or. There are quite a number of properties in that section which show up large bodies of ore, carrying both gold and silver, and with the monetary question settled, as is now probable, looking to the improvement of the present situation, the camp will take its place among the leading producing districts of the West.

RICH PLACERS.—Albany *Herald*: Three men from Mill City (Mr. Fuller, Mr. Wadsworth and a companion) have recently been opening a placer mine near Quartzville. They brought back with them $30 in coarse gold, taken out in two days, and have struck pay dirt in plentiful quantity. They have taken in tools and will work the claim steadily.

THE SIMMONS & CAMERON.—Rogue River *Courier*, Aug. 24: J. L. Wilder went down to Galice Creek Thursday, where he has a contract to put up 2500 feet of hydraulic pipe in the Simmons & Cameron mines. He intends manufacturing the pipe at the mines, and it will probably take three months to complete the job. This property is one of the "permanent" ledges of the county, and the owners hope, with the additional pipe, to be able to make a better showing than ever at the end of the coming winter's run.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 31, 1893.

The passage by the lower house of Congress of the Wilson repeal bill had little effect on the silver market. The fluctuation for the week has been no greater than in the past several weeks. The New York price dropped Tuesday 10 73 from 74¼ the day before. The Treasury Department yesterday was offered 260,000 ounces of silver at 74⅛@75¼ cents, and purchased 30,000 ounces at 74¼ cents. The same price was tendered for the remainder.

The mints in India were closed to free coinage on June 26, 1893. It was feared that this would seriously affect the demand for fine silver in that quarter. It is gratifying to know that these fears have not been realized. For the six weeks following the closing of the India mints, the shipments of silver from Europe to India, China and the Straits compare as follows with the corresponding period last year:

	1892.	1893.
To India	£948,300	£538,200
To China and Straits	342,500	817,500
Total	£1,290,800	£1,355,700

Referring to these statistics, the London *Statist* says: "The consumption of silver does not and will not abate. The recent fall was due to the policy of the Indian Government, and was not the consequence of a cessation of the demand." This will be good news to American silver producers.

Large Treasure Exports.

The shipments of treasure from San Francisco by sea this month have been unusually large, especially Mexican dollars, while a large amount of silver bullion has also been sent away. There have been 1,326,921 Mexican dollars and $232,000 in silver bullion already shipped. Gold coin amounting to $99,000 has been sent to Honolulu.

Imports of Tin Plate.

The following table shows the exports of British tin plate to the United States for each month in the past five years in tons of 2240 pounds:

	1893.	1892.	1891.	1890.	1889.
January	23,498	17,554	32,018	23,613	28,471
February	20,190	24,268	28,253	18,334	27,879
March	31,334	22,789	38,638	17,245	30,936
April	31,651	31,061	45,208	23,373	31,017
May	26,988	23,799	53,569	25,619	31,929
June	26,759	23,550	53,539	30,793	29,269
July	22,248	24,750	4,823	37,011	23,718
August	.....	24,221	5,629	25,519	26,756
September	.....	22,535	11,139	25,557	28,890
October	.....	19,901	12,461	36,955	25,647
November	.....	20,634	14,831	28,330	30,345
December	.....	23,417	13,536	25,709	21,756
Totals	.....	276,479	325,145	318,108	336,692

The Iron Outlook.

The situation in the iron trade has not improved, says the *American Manufacturer*, Aug. 25th. It is claimed in some quarters that there are evidences of an expansion of trade, but it would be difficult to support such a statement by facts. It is true that the volume of business shows no increase. Bright anticipations are indulged in, but buyers are waiting for some evidences of increasing confidence, and firmer prices, before placing heavy orders. Easier monetary conditions will change everything. The only statement warranted by the facts is that there is a general anticipation of improvement, and honest intentions of entering upon active work as soon as it is safe to do so. Favorable reports come from Chicago and one or two other Western markets. Throughout the East sluggishness prevails, and resumption of work is progressing but slowly. Stocks are very low, and this is a strong and encouraging feature of the situation. The railroad companies contemplate large purchases as soon as they are assured that the most favorable time for action has arrived.

Silver and the Metals.

NEW YORK, Aug. 31.—Following are the closing prices for the week:

	Silver in— London.	N. Y.	Copper.	Lead.	Tin.
Thursday	34⅝	74¼	9 60	3 50	18 90
Friday	34	73	9 50	3 45	19 02½
Saturday	34	73	9 50	3 45	19 02½
Monday	34	73	9 40	3 55	19 10
Tuesday	34	73	9 50	3 72½	19 10
Wednesday	34½	73¼	9 50	3 56½	19 25

Mining Share Market.

SAN FRANCISCO, Aug. 31, 1893.

The Comstock market has been exceedingly dull during the week. Practically no business has been done, and brokers have been engaged more in discussing the silver question than anything else. There was some activity, early last week, but it proved too much for the market in its weakened condition and it has shown no sign of life since. At its weekly executive session yesterday, the San Francisco Stock and Exchange Board extended the time for listing the shares of all gold mining companies, free of all charges, except the payment of the annual dues of $100, until January 1, 1894.

The latest reliable news from the Comstock is that the conference held between the representatives of the railroad, water and other leading interests, and the mechanics, was favorable. A conference with the miners is also to be held, but it is doubtful whether they will come into line on the reduction of expenses question as readily as the other interests have done. They may do so, however, in time. There was to be some further reduction in the force of miners in several of the mines to-day.

The following assessments were delinquent in the Boards to-day: Belcher, 25 cents; Ophir, 25 cents, and Chollar, 10 cents per share.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUGUST 8, 1893.

502,900.—INCUBATOR AND BROODER—J. W. Atkinson, San Jose, Cal.

502,948.—ARC LAMP—L. H. Buchanan, Pasadena, Cal.

502,940.—BICYCLE BRAKE—C. B. Burns, S. F.

502,950.—PUMP—Wm. Cameron, Milpitas, Cal.

502,001.—CHIMNEY—L. E. Clawson, S. F.

502,812.—MAGAZINE GUN—M. H. Durst, Wheatland, Cal.

502,902.—AMALGAMATION—G. H. Evans, S. F.

503,077.—PAPER BOX—Wm. Forsyth, Fresno, Cal.

502,906.—PLANE—Louis Hardt, Yuba City, Cal.

502,905.—ELECTRODE—J. N. & H. J. Harrison, S. F.

502,818 —ROTARY ENGINE—H. P. Holland, S. F.

502,820.—TRACTION ENGINE—B. Jackson, S. F.

502,908.—SPIRAL SPRINGS—W. B. Jackson, Portland, Or.

502,934.—DREDGER—W. B. Pless, S. F.

502,891. — COIN CONTROLLED APPARATUS — G. F. W. Schultze, Berkeley, Cal.

503,102.—PIPE MACHINE—F. M. Speed, S. F.

502,787.—BUCKLE—F. W. Swigart, Arroyo Grande, Cal.

502,839.—STAMP—C. W. Tremain, Portland, Or.

502,943.—CLOTH MEASURER—Wren & Oliver, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FAUCET.—William F. Harris, S. F. No. 503,477. Dated Aug. 15, 1893. This device has for its object the provision of a simple, tight and readily-operated faucet, which, while adapted for various uses, is especially applicable to oil cans. It consists generally of a ported disk having its back flat and adapted to be soldered to the can. The face of the disk is socketed and has seated in it a ported disk valve to which the handle spout is attached. The adjacent faces of seat and valve are so ribbed and grooved as to bind tightly between them an intervening ported washer, whereby all leakage is avoided.

CHIMNEY.—Leonard E. Clawson, S. F. No. 502,901. Dated Aug. 8, 1893. This invention relates to improvements in chimneys and their connection with fire-places. It consists of an arched and inclined shell secured beneath the arch bar and serving as a bond to connect the chimney and the mantel, and to prevent any opening by shrinkage or otherwise through which fire can pass.

ELEVATOR SAFETY ATTACHMENT.—C. B. Labatt, S. F. No. 503,486. Dated Aug. 15, 1893. This invention consists of a series of movable stops fulcrumed in the vertical guide timbers between which the cage moves, and weighted cords connecting with said stops and passing over pulleys to connect with some movable part which will release the cords and throw the stops into the path of the cage in case the hoisting rope breaks.

STRAP OR ROPE ATTACHMENT.—E. R. Robbins and L. L. Matrath, Sacramento, Cal. No. 503,497. Dated Aug. 15, 1893. This invention consists of a device to be applied to hitching straps and ropes, which allows the strap to be adjusted and secured at any desired length. This is effected by loops or keepers through which parts of the strap pass, and within which it binds or locks at any desired point, and a snap-hook or other fastening for the free end of the strap.

BRAID RACK.—August H. Marten, San Jose, Cal. No. 503,488. Dated Aug. 15, 1893. This invention relates to a novel and convenient means for displaying braid, laces and similar articles, and consists of a permanent or movable slotted base and light racks having projecting corners which are adapted to fit the slots in the base, while the central portion serves to receive the material. This construction allows a great number of racks to be set on edge side by side, and any one can be removed for exhibition or replaced at will.

AMALGAMATOR.—Jos. S. Johnson. No. 503,765. Dated Aug. 22, 1893. This apparatus consists of an endless traveling inclined belt passing around drums at each end and provided with hinged metallic overlapping plates upon which the valuable metals are amalgamated, and a series of brushes impinging upon the upper surface to keep them bright and clean. Below the belt is a washing tank, into which the plates dip as they pass along the lower side of the belt, the hinges allowing them to swing down for this purpose.

FAINOR OR TRIMMING HOLDER.—J. M. Schlesinger. No. 503,752. Dated Aug. 22, 1893. This invention consists of a card or holder upon which fringe or trimming may be wrapped, said holder being provided at opposite ends with studs by which the holder is suspended from a suitably constructed standard, so that the goods are easily inspected without handling, and any card may be removed for the purpose of removing goods therefrom.

BASEMENT VENTILATOR.—Peter H. Jackson, S. F. No. 503,484. Dated Aug. 15, 1893. This invention consists of a tubular extension down from the open grating in the roof of a basement extension, and a pan, of larger diameter than the tube, suspended beneath it so as to catch the drip from above and allow a free circulation of air.

LUBRICATOR.—Chas. E. Travis, Los Angeles, Cal. No. 503,506. Dated Aug. 15, 1893. This invention consists of a cylindrical receiver, into which the oil descends after having lubricated the moving part, and from which it is pumped up to the oil cup again by a reciprocating piston moving in the receiver as the latter reciprocates.

TAKE PROTECTOR.—Edwin H. Black, Campbell, Cal. No. 503,759. Dated Aug. 22, 1893. This invention consists of a series of metallic strips, vertically disposed directly against the base of the tree and separated from each other, said strips extending from the surface of the ground down to the point where the main roots diverge. The object is to prevent gophers from girdling the tree.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

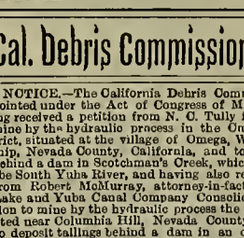
Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from N. C. Tully for permission to mine by the hydraulic process in the Omega Mining District, situated at the village of Omega, Washington Township, Nevada County, California, and to deposit tailings behind a dam in Scotchman's Creek, which discharges into the South Yuba River, and having also received a petition from Robert McMurray, attorney-in-fact for the Eureka Lake and Yuba Canal Company Consolidated, for permission to mine by the hydraulic process the Farrel mine, situated near Columbia Hill, Nevada County, California, and to deposit tailings behind a dam in an old hydraulic pit, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on September 4, 1893, at 1 o'clock P. M. On and before this hour and date, all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

ARTIFICIAL LEGS AND ARMS

WITH RUBBER FEET AND HANDS.

It is not unusual to see an engineer with hand on the throttle, or a conductor, brakeman, fireman, carpenter, mason, miner, in fact men of every vocation, wearing one or two artificial legs with rubber feet, Marks' Patents, and performing as much labor as men in possession of all their natural members.



Over 14,000 artificial limbs of Marks' Patents in use. Purchased by the U.S. and many foreign governments. One-half of the limbs furnished by us are made from measurements without our seeing the wearers. Fit guaranteed. A treatise of 430 pages, with 260 illustrations and a formula for measuring sent free. Address,

A. A. MARKS, 701 Broadway, New York.

MANUFACTURERS FOR THIRTY-THREE YEARS.

CALIFORNIA WIRE WORKS

OFFICE, 9 FREMONT ST., SAN FRANCISCO, CAL.

LOS ANGELES AGENCY, LOS ANGELES, CAL. PORTLAND AGENCY, PORTLAND, OREGON.

WIRE ROPES
For Mining, Hoisting, Transmission of Power, Etc.

WIRE CABLES
For Cable Railways, Etc.

WIRE RIGGING
For Ships, Derricks, Etc.

WIRE of all kinds
Best Steel.

WIRE NAILS,

BARBED WIRE,

Colorado is All Right.

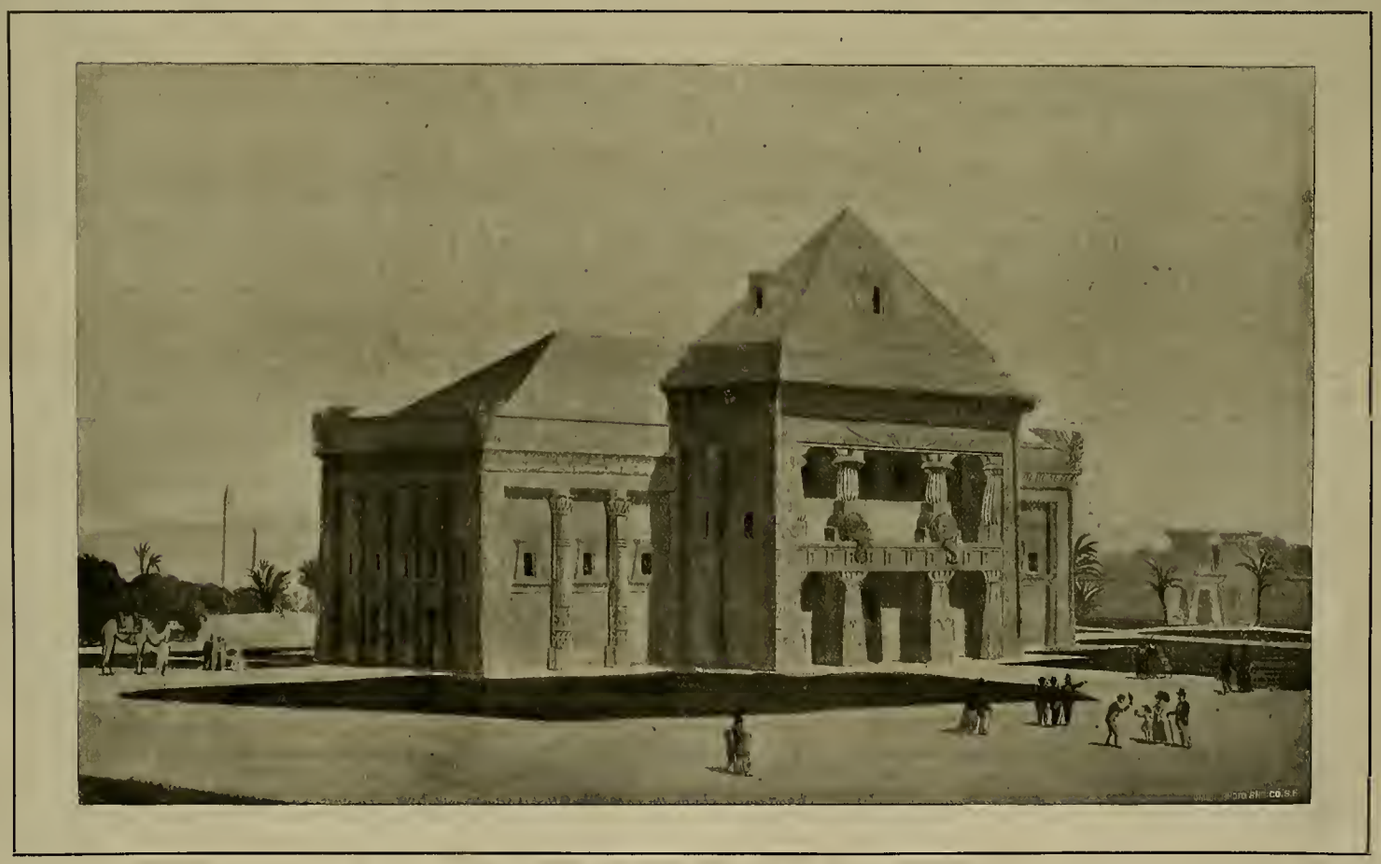
Next to California, Colorado is the largest gold producer in America; and the prospect now is that the Centennial State will take even more important rank in that branch of mining. There is no probability that it will surpass California, for obvious reasons; but its gold prospects and its gold mines, placer and quartz, will be developed as they never were before. The activity at Cripple Creek has assumed something like the dimensions of old-time excitement; and even tbe famous Leadville district will be converted into a gold region nf no small importance. Up to this time something like $12,000,000 in gold have been taken out altogether, and it is thought that the real deposits have not yet been touched.

A number of schemes for the development of placer mines are projected, several of which contemplate the employment of large capital and hundreds of men. John F. Campion, at the head of one enterprise, has acquired 5000 acres of lode and placer claims for development. Operations in the Leadville section heretofore have bsen confined to the pay dirt above the water level, and in consequence the diggings have never gone below 45 feet, or to water level. It is now proposed to sink shafts to bed rock, or to a depth of 100 feet. Pumping and hoisting machinery will be put in, the pay dirt raised to the surface, and there sluiced and washed. After the value of the pay dirt below water level has been thoroughly tested, it is the intention to construct an immense bedrock flume in the Swan river, and by means of modern and improved hydraulic apparatus, wash out the entire gulch to bedrock. The scheme is altogether a very large one and involves tho expenditure of a vast deal of money and the employment of much pluck, skill and energy. But Leadville appears to be equal to the situation. The debris of hostile legislation may fill the stream of Colorado spirit and enterprise; but the current is only diverted, not dammed.

One More Fair Building.

The announcement is made by the management of the Midwinter Fair that it is ready to receive bids for the construction of the Manufactures and Liberal Arts Building; and it is designed to begin the erection of other structures as rapidly as practicable. The whole Fair project is now declared to be in satisfactory shape. Collection of subscriptions has begun and responses by subscribers are said to be prompt and liberal. The outlook is for an exposition of very large dimensions, exceeding in importance and attractiveness any show ever held west of Chicago.

We present this week an illustration of the proposed Fine Arts Building, reprodnced from the *California Midwinter International Exposition Illustrated*, the official publication. The design is by C. C. McDougal, and it is both unique and original. It is planned to be fireproof, being constructed of brick. The building will be 60 feet wide, 120 feet long and 40 feet high. It is an example of Egyptian architecture, or, more correctly, perhaps, a collective illustration of the art of building as practiced by the Egyptians. The columns are grotesqnely ornamented, and in the second story take the form of or give place to elephants. Above the portico is the type of building classed with the world's wonders, and a small pyramid surmounts tbe vestibule. Tbe columns will all be of wood on the outside of a plain, solid rectangular fireproof brick structure. The blank walls will be decorated in Egyptian style, the acquille being naturally very prominent. The estimated cost of this structure is about $70,000. It will be lighted entirely from the roof, and will have apartments for the different branches of fine art work.



FINE ARTS BUILDING AT THE MIDWINTER FAIR.

TO-DAY is celebrated the forty-third anniversary of California's admission as a State. It has been said that this commonwealth is the only instance where a State was admitted into tbe American Union without previous probation as a Territory. But the orator who alludes to California as a "full-armed Minerva springing into existence," and asserts it was a sole and only instance of the kind, is mistaken. California was the eighteenth State to come into the Union, not counting the original tbirteen; other States came in on similar terms before and since. Kentucky in 1792, Tennessee in 1796, Maine in 1820, and West Virginia in 1863, are instances.

THERE is considerable activity in Montana gold properties, though the cessation of operations in silver mines has been pretty general. Several big deals have occurred about Butte, the last of which transferred the Broadway group of gold-bearing claims, located in the Silver Star district, to a company of capitalists for a sum amounting to nearly $100,000. The purchasers are M. J. Silvia of Santa Clara county, Cal., Mr. Davies of Salt Lake, H. G. Dean of Los Angeles and William Everett of Denver. The ground comprises four claims. The purcbasers intend to begin active operations at once.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 175.

THE expressions of the president of the Anti-Debris Association in his annual address appear to indicate that all is not harmonious in that estimable organization President Stone declares substantially [see page 164] that the California Debris Commission knows what it is doing and should not be interfered with; that violations of law by hydraulic miners should be called to the attention of the commission by anti-debris friends; and that it is the business of the anti-debris attorney, in his appearances before the commission, simply to give information. Yet it has been represented by the self-nominated oracles of the anti-debris people that the association was opposed to the Caminetti law; that it doubted if the commission would or could afford adequate protection to the farmer under its operations; that the proposed impounding dams would not impound; and that the miners would hesitate at no device, however wicked and unscrupulous, to get the farmers at their mercy. We are also regaled by the spectacle of the attorney of the Anti-Debris Association, in defiance of this clear expression of the head of the organization, filing protests against the grant of licenses to mine; and, in public interviews, intimating that the courts will be appealed to if the protests are not headed. It is not to be presumed that President Stone counsels one thing before the association and urges another before the executive board, which has employed Attorney Devlin and apparently directed his course. The fair presumption is that the executive board is a law unto itself, and allows itself to be instructed by the association, its creator, only when it chooses.

STATE ASSEMBLYMAN THOMAS estimates that Nevada county has lost from $3,000,000 to $4,000,000 annually through the suspension of hydraulic mining. In course of an interview in a local paper he says:

Why, jnst think of it, onr assessment roll fell off one-half dnring the first year after hydranlicking was prohibited. This fact alone will convince the most obdnrate of the value of this indnstry. We need this money; we mnst have it. Look at the depression in financial and commercial circles. A great part of the panic might have heen averted if the hydraulic mines had continned their operations uninterrnpted. Very near $120,000,000 have heen lost to the cnrrency of the world through the snppression of these mines—a far greater amount than the Treasury reserve of the United States. In the San Jnan ridge we have one of the hest localities in the State of California. We have qnartz mines as well, and shortly you will witness a great hoom in mining in that part of the conty.

The assemblyman reflects the sentiments of practically all California, and particularly of the miners along San Juan ridge, who are enthusiastic over the prospect of resuming operations and are directing their steps to that end. Restraining dams will restrain. The Debris Commission thinks so, and, inasmuch as the Commission has the power to prescribe largely in what manner and under what conditions mines may be operated, its opinion is of great importance.

Gold and Silver Reserves.

According to a statement by Secretary Carlisle, the silver purchases for the month of August amounted to 3,898,022 fine ounces, costing $2,880,532. The total purchased under the Sherman Act has been 163,047,664 fine ounces, costing $151,804,170. The silver bullion on hand at the several mints is 134,625,492 fine ounces, costing $122,302,756.

From the bullion purchased, says the Secretary, 36,087,185 silver dolars have been coined, the bullion therein costing $29,502,117. The statement of the Secretary is incomplete and misleading, inasmuch as it tends to encourage an impression that there are immense quantities of useless and idle silver stacked in the vaults of the nation. There are not. Great sums of silver are there, but they are largely held to secure the circulation of a vast issue of silver notes. Silver is, or it ought to be, and the law contemplates that it shall be, the basis of our currency just as much as gold.

From the report of the director of the United States Mint, we find that the number of silver dollars in the treasury on December 31, 1892, was 355,054,049, and silver bullion $99,824,220, against which there were outstanding in circulation $322,035,011 silver certificates, redeemable in silver. The amount of gold coin in the treasury was $155,662,452; gold bullion, $81,826,630, against which there were outstanding $117,093,139 in gold notes.

Considering the bullion as money, the relation of the coin and the outstanding gold and silver notes is therefore as follows:

	Coin.	Notes.
Gold	$237,489,082	$117,093,139
Silver	454,873,269	322,035,011

Subtracting the circulation in notes from the coin in the treasury, we find the idle silver to be actually less in proportion than the idle gold in the treasury. Even if we take from the amount of gold the $100,000,000 reserve, we still find the proportions of active and idle money but very slightly against silver and in favor of gold.

It is the constitntional policy of the United States to maintain the use of gold and silver at parity. All acts of legislation are ostensibly framed to carry out this fundamental principle, and to maintain the currency of the conntry on a basis of bimetallism. But it has been the persistent and continuous effort of the Treasury Department, without warrant of law and in defiance of custom, the policy of our constitution and the will of the people, to place the country on an exclusive gold basis, and to depreciate silver, discourage its use, depress its value and disturb the relations of equality that naturally exist between the two metals. Evidence of this determination of the Treasury officials is found in the fact that $100,000,000 in gold is set aside for the redemption of about $450,000,000 legal tender (greenback) notes of the country, which are expressly declared by law to be payable in either gold or silver. The option of redemption in either metal is left explicitly with the Treasury Department. There exists no reason why the Secretary cannot exercise the authority reposed in him and carry out the intent of law. His pretext for insisting on exclusive gold redemption has been that it maintains confidence, and payment in silver would destroy confidence. But the attitude of the Secretary of the Treasury has been a most potent factor in exciting distrust of silver. The first step toward depreciation of silver by the Government itself was taken when the bimetallic principle of our laws was violated and the gold reserve was created. If there had been no gold reserve, but a gold and silver reserve, with no distinction between the metals, and if the Treasnry Department had, from the resumption of specie payment, insisted upon its prerogative of redemption in either money, the present sorry financial condition of the country would never have been brought about.

The chief responsibility for the panic lies with the Treasury Department of the United States. It has attempted to undermine confidence in the bimetallic system, and it has kindled a fire that it has not yet been able to extinguish.

Wages on the Comstock.

The miners on the Comstock have practically decided to resist the proposed 25 per cent reduction in wages, and have framed a reply to the document submitted early in August by the mining presidents. Further conferences will probably be held, but the outlook now seems to be that no amicable conclusion will be reached.

The contention of the miners is that wages cut but a small figure in the total cost of mine operations, and that the effort to reduce expenses should more properly begin with the office force. They point out that large salaries are paid to officials, the functions of some of whom seem to be ornamental more than useful. Figures have been collated which make a very interesting showing: The total expense of thirty-one mines for June, 1893, was $194,571.60, of which $43,960—less than twenty-five per cent—was paid out for miners' wages. The salaries of presidents, secretaries and superintendents show a total of $16,680. It is claimed that this item has been materially reduced since August 1st, but previous to that time some of the officials held places in four or five mines, and thus secured salaries amounting to from $650 to $825 a month. The miners get $4 a day.

In the Alpha one miner was employed half of June at a cost of $60. But there were a president at $150, a secretary at $150 and a superintendent at $75. It took $300 in office salaries to keep one miner going in the Confidence. Overman paid a superintendent $300, a president $150, a secretary $200 and an assistant secretary $50 to keep eight miners at work.

At Alta not a pick was handled by a miner, but a president got $125, a secretary $250, a superintendent $300, and $50 was paid out in office rent, while the total expenses were $3475. And so on. The list might be extended at length.

A certain number of officials is necessary, and they are entitled to and earn good salaries. But, when the pruning knife is to be applied to the salary list, all employes should share alike. The effort at retrenchment should not be confined to miners' wages alone.

It is interesting to know just how lucrative Comstock shares have been to stockholders in recent years. The official showing of a number of mines, according to sworn reports, for the three-fourths year ending Sept. 30, 1892, was as follows:

Company.	Gross Yield.	Expenses.
Belcher	$63,032 71	$67,801 32
Challar	9,615 00	26,854 69
Challenge	11,286 03	28,954 46
Confidence	11,099 16	28,947 06
Con. Imperial	14,619 52	43,269 12
Con. Cal. & Va	639,444 67	692,113 27
Hale & Norcross	88,619 47	162,073 89
Kentuck	4,102 35	8,010 35
Overman	68.870 94	81,274 99
Occidental	44,861 00	46,844 00
Potosi	179,258 92	180,766 12
Savage	329,963 87	342,171 68
Yellow Jacket	79,689 61	150,197 44
Totals	$1,660,923 66	$1,869,183 69

These figures are instructive. They show that, in some instances at least, the year 1892, with moderate economy, might have been one of genuine, not Irish, dividends. They may suggest, also, that retrenchment all along the line will be necessary before the Comstock can be supported on some other than the assessment plan.

IN contrast to the general stagnation of trade and the paralysis of nearly all lines of production the activity in the gold mines of California stands out in striking relief. Wheat is lower than ever before. The fruit season has been without profit, and, in some instances, losses have been considerable. The wool market is completely demoralized. Hops are inactive, though prices, owing to large shortage in the foreign output, are nominally fair. Barley and all grains are very cheap. Lumber and coal are at a very low ebb. The iron industry is paralyzed. There is heavy overproduction of cotton, and the market is glutted. Silver, copper and lead have gone down together. And the list might be extended indefinitely. Overproduction has been responsible for the situation in part only. The war on silver, the panic, hostile legislation, or the fear of it, and general loss of business confidence have done the rest. In the midst of the great cataclysm of failures and depression the gold industry has stood like a rock. The shutting down of silver mines in some localities will restrict the incidental gold output there, but the development of gold mines has been going forward on a larger scale in California and in other gold-producing sections than for years. The output in this State for 1893 will considerably exceed the record of 1892, when it was $12,500,000.

THE State of Nevada has no reason to take a cheerless view of the future. The silver industry is not dead. Silver is a natural money metal, whose continued use in very large volume is certain. There is an apparently invincible disposition on the part of the controlling powers in legislation, backed by a misguided and exaggerated sentiment among Eastern people that silver is responsible for all the present financial evils, to stop its further coinage; but the reaction is certain to come. If not free coinage, then bimetallism will ultimately be the policy of the country. There must, sooner or later, be a revival of silver production. Besides, Nevada's mineral resources are by no means confined to the white metal. There are tin, copper, lead, antimony and nickel in large quantities. Iron and aluminium are constituent elements of the everlasting hills, or some of them. Gypsum and borax are already heavily produced. And the gold mines are capable of such development as to bring a large income into the State. All this is outside of the fine agricultural resources of Nevada. Pending the revival of silver mining, they can and will be developed. Nevada is all right.

One More Black Sand Invention.

A local inventor, whose name is as yet unheralded to fame, has secured letters patent for a new process of extracting gold from black sand, and the somawhat threadbare statement is made in connection with the invention that the problem of working black sand profitably has at last been found. The process is thus described in a daily paper:

Briefly told, his method of extracting gold from black sand has not been to destroy the iron, magnesium, etc., but merely to set the gold free and otherwise leave the sand intact. The plants consists of a cylinder 42 inches long and 22 inches in diameter, with a manhole in the side. The sand is put in at the manhole and the water is added. To the mixture certain chemicals are then added, combined in a manner which is the secret of the method. The cylinder is put in motion and simultaneously an electric current of 50 amperes and 6 volts is turned into the cylinder contents, much as an electrolising bath. After 20 minutes' revolution the manhole is opened, the sand is dumped into a hopper and passes on to a concentrator and amalgamator. The gold unites with the quicksilver of the amalgamator and is then scraped off and retorted, the sand having been washed away by the stream of water which passes over the inclined and gently shaking amalgamator. The theory is that the chemicals and electric current act on the gold alone.

The first sentence sounds familiar, but there are some features of the appliance that are really novel, though the description is in places a little vague. The inventor, we are informed, has spent some years of study and experiment and $10,000 in cash on his process. It has now been in operation three months, it is said, and it handles, with two men, ten tons of sand a day, at a cost of $1 per ton, and a profit of $5 to $10 per ton. Incidentally, a cheap method of extracting ore from sulphurets has been found.

It is to be regretted that the inventor deems it in conflict with his financial interest to disclose to the general public the secret of his wonderful chemical compound. There are incalculable quantities of black sand between San Diego and Alaska, all of which the inventor can hardly hope to cover himself and which might be worked profitably by others without disadvantage to him. But, of course, he knows his own business.

There have been processes and processes and processes of working black sand, and we are constrained to withhold final judgment on this latest method until we know a little more about it.

It may work, but a long line of failures in the same field of invention precedes it.

The Cruiser Olympia.

There is good reason to anticipate that the new cruiser Olympia, whose "dock" trials have been taking place the past two weeks, will be not only the fastest vessel turned out by the Union Iron Works, but the swiftest in the United States Navy. The Olympia has already exceeded twenty knots under circumstances that indicate she will beat twenty-one knots, the best record of the cruiser New York on her official trial trip, three months since. The unofficial tests of the Olympia have all been in San Francisco harbor, and when going at full speed, or nearly full, the vessel invariably sucked bottom. There should be one fathom of water for every foot of draught, and for that reason Santa Barbara channel is chosen for all official tests on this coast. When the Olympia was in less than fifteen fathoms, drawing twenty-one feet and making sixteen to seventeen knots, she would pull a big swell around her and squat down like a river-boat, with only a foot or two of water under her keel. At that depth she would stir up mud at the bottom; and she would drag the swell astern of her. She was sluggish and took notions all the time to run off. It took 25 deg. of the helm to hold her to her course, but when she got into twenty fathoms 3 deg. held her easily and she turned beautifully with 10 degrees of the helm. But when she struck twenty fathoms depth she steered like a pilot-boat and ran like a deerhound. All this time, her machinery ran as smoothly as a sewing machine.

The Olympia has four double-end boilers, weighing eighty tons each, and two single-end boilers. On these trips she did not use all her power and was blowing off steam most of the time. She turned as many as 132 revolutions a minute, while she will be able to turn 145 revolutions.

The official trial trip of the cruiser cannot take place for probably two months. The barbette armor is now being placed in position and then her upper deck will be laid. Much joiner work remains to be done. Her machinery will require very little attention. The bearings are already smooth, almost to perfection. When she is finished, with her guns on board, she will draw twenty-four feet.

Altogether, the Union Iron Works have reason to be satisfied with the Olympia. She is a model of modern commerce destroyers. Her movement is swift and precise, her machinery perfect and her model admirable.

It is expected that the Senate will next week reach a vote on the repeal of the silver-purchase provision of the Sherman law. The Senate is considering the matter in a leisurely manner, and has declined to affix any limit to the debate. The silver men are well organized, and the vote will doubtless be close. Senator Stewart occupied a large part of Tuesday and Wednesday in advocating the cause of silver, and had not finished at this writing (Thursday). No plan of subsequent legislation has been agreed upon, provided the repeal bill passes; but there is no doubt that some bill assuming to recognize silver will be offered.

The recent controversy over the matter of tin-plate production seems to have been settled in favor of the home producer. There are now in the United States 35 active manufactories of tin and terne plate and tinning sheets. *Tin and Terne* has been collecting statistics of manufacture, and the returns from 31 factories for three months ending June 30th are as follows:

	Lighter than 68 pounds to 100 sq. ft.	63 pounds to 100 sq. ft. & heavier.
Tinned Plates	17,010,536	904,470
Terne Plates	15,286,447	355,507
	32,296,983	1,259,977
Estimated production of tin and terne plates of four firms making no returns	2,750,000	
Made from American black plates	15,667,219½	
Made from imported black plates	20,662,516⅔	

The total weight of all plates tinned, irrespective of weights per 100 square feet, is 36,306,960 pounds, nearly 45 per cent of which were from American black plates.

At the annual meeting of the Nevada County Miners' Association, August 31, the following officers for the coming year were elected: President, Alf. Tregidgo; vice-presidents, J. S. McBride, R. McMurray, E. Colaman, P. Camphell, J. S. Goodwin, N. C. Miller, Geo. Fletchar, H. C. Callahan, Niles Searls, J. G. Mather; secretary, W. F. Englebright; assistant secretary, I. J. Rolfe; treasurer, B. F. Snell; executive committee, A. Tregidgo, J. M. Walling, M. L Marsh, Geo. Fletcher, Fred Searls; finance committee, J. T. Morgan, Jos. Weissbein, C. R. Clarke, E. J. Rector.

The executive committee was empowered to appoint one delegate for every ten members, to attend the Annual State Convention to be held at San Francisco on the second Monday in October. Among other things done by the association, the Midwinter Fair was endorsed, and the administration of Hon. Robert McMurray as World's Fair Commissioner was commended.

It appears not to be mandatory that the Debris Commission shall, under the Caminetti Act, require the construction of restraining or other works as a condition precedent to the operation of hydraulic mines. Section 15 of the Caminetti Act provides:

No permission granted to a mine-owner or owners under this act shall take effect, so far as regards the working of a mine, until all impounding dams or other restraining works, *if any are prescribed by the order granting such permission*, have been completed, etc.

It seems to us that the commission will be acting entirely within its power if it allows the operation of mines without restraining or other works in cases where the navigable streams will not be interfered with and the rights of others will not be affected.

Tailings.

Denver proposes to bring into existence a party whose motto shall be free silver and free trade.

The day the Wilson bill passed the House the Butte *Inter Mountain* draped its columns in black.

The Plumas *National-Bulletin* has passed its twenty-eighth mile post. It is one of the best of our country exchanges.

At Forbestown it is impossible to get a bed for a single night, and a stranger going there must be prepared to furnish his own sleeping quarters, says the Palermo *Progress*.

It is reported in Grass Valley that the Harmony mine of Nevada City has been sold to Orrin Gowell, a San Francisco capitalist. The price said to have been paid is $15,000.

A gold bar valued at $15,000 has been shipped to the Carson Mint. The bar represents the product of 20 tons of ore extracted from the West mine in the Devil's Gate district, last month.

Encouraging reports continue to be received from the White Horse gold mines, near Wadsworth, Nevada, says the Winnemucca *Silver State*. The camp promises to develop into a great gold producer.

Articles of incorporation have been filed in San Francisco on behalf of the Grant Gold Mine Company, with a capital of $600,000. Directors—T. N. Machin, I. V. Hayes, Valentine G. Hush, S. R. Thorne, Henry L. Fox.

F. F. Coffin has resigned the superintendency of the mines formerly under his control, says the Winnemucca *Times-Review*, and will depart for California this week. R. M. Catlin succeeds Mr. Cashin as superintendent.

Four of the six smelters in Leadville district, Colorado, have shut down, and the fifth will soon follow suit. Leadville has already turned its attention to gold production, and placer mines will be developed on an extensive scale.

The famous Utica quartz mine at Angels, Calaveras county, owned by Alvinza Hayward, the Hobart estate and C. D. Lane, yielded last month the enormous amount of $165,000, which was $25,000 more than the owners expected. This is the biggest clean-up in the history of the mine.

Ten miners and two engineers were dropped last week from the Best & Belcher and Gould & Curry mines, leaving only one shift employed in underground explorations. Six men were also dropped from the Kentuck mine. The failure of the shareholders to pay their assessments is given as the cause.

The company formed to operate the Grand Victory mine near Hanks Exchange in El Dorado county is styled the New Grand Victory Mining Co. It is incorporated with a capital stock of $1,000,000, and the present directors are M. Thompson, W. C. Stratton, T. Clark, S. B. Clark and J. Gordon.

Prof. Geo. Davidson of the Coast and Geodetic Survey has notified the office in this city that he will return from the scene of his labors, near Lake Tahoe, on September 10th. Now that the work of fixing the eastern boundary of the State has been started, the presence of Prof. Davidson in the field is no longer necessary.

A mass meeting at Placerville last week endorsed the following resolution: "We are opposed to the repeal of what is known as the Sherman Act or any of its clauses or provisions in the present extraordinary session of Congress, unless a substitute providing for free coinage of silver, the product of American mines at a ratio of 16 to 1, shall take its place."

The stockholders of the Morning Star gravel mine of Iowa Hill, most of whom are Grass Valleyans, held their annual meeting last week and re-elected the old Board of Directors as follows: J. H. Neff, Frank S. Richards, Henry Disque, Edward Coleman and John C. Coleman. The Board organized by electing J. H. Neff president and superintendent; Frank S Richards, vice-president, and Henry Disqus, secretary and treasurer.

The Alma Gold-Mining Company has been incorporated for the purpose of developing the Mattley field claim near Jackson, Amador county. The capital stock of the company is $1,000,000, divided into 200,000 shares of $5 each. The directors of the company are: George B. Hazelton, president; J. N. Wells, vice-president; D. Gutman, secretary; W. B. Hamilton, H. H. Bodwell and J. B. Francis. Mr. Francis is superintendent.

Articles of incorporation of the Idaho and Eureka Northwest Extension Mining Co. have been filed with the clerk of Sacramento county. The principal place of business is to be Sacramento. The capital stock is $20,000, divided into 200,000 shares. The amount actually subscribed is $75,000. The directors are John F. Cooper, George F. Norss and A. C. Hinkson of Sacramento and E. B. Thomas and Perly Brown of Grass Valley.

The Eastern Star Gold and Silver Mining Co. has filed articles of incorporation with the Nevada county clerk. The company is incorporated with 100,000 shares of the par value of $10 per share. Sixty thousand shares have been subscribed. The company has claims on Rattlesnake creek, and it proposes to proceed at once with the development work. The directors are Frank E. Dennen, Elam Biggs, Geo. Vincent, P. H. Paynter and D. N. Coffin.

The Hancock Mining Company, whose property is located on the Mokelumne river, has been incorporated with 100,000 shares of stock at a par value of $1 per share. Following are the directors: Jackson Dennis, president; J. Nichols, secretary; W. D. Chambers, superintendent; John Brown and C. O. Mitchell. The Amador *Record* says: A water hoist is to be put in and the work of sinking a shaft 300 feet will be begun at once. The vein on the surface will average about six feet in width and will mill about $5 a ton. Thirty thousand shares of stock are owned in Amador City.

A large and important find of gold is reported in western Australia, in the land of the Hampton Railway Syndicate. So favorable was the showing made at the preliminary tests of the ore that the concern in question has converted nearly a third of its lease-hold of Australian lands, which amount to nearly a million and a half acres, into freehold. In some parts of the district the metal is found in large pieces absolutely free, no crushing being necessary. The fact that nearly all the gold-bearing land has already been gobbled by the syndicate, however, leaves little incentive for prospectors.

The old placer pioneers will watch with interest the progress of operations, in building the cut-off at the mouth of the Yuba river, says an exchange. The Yuba and Feather rivers were marvelously rich in gold dust in the early days, and pioneers who know that part of the country expect that some rich pockets and rich deposits will be found. The new mouth will leave dry a mile and a half of the Yuba at the present confluence of the Feather river. As soon as the waters are turned into the new channel, prospectors with shovels, pans and rockers will flock to the scene to try their luck.

Superintendent Daggett of the Mint has issued a few directions in regard to the handling of gold bullion. The gold must be sent to the Mint in such a manner that it can be easily inspected and receipted for. It cannot be shipped directly to the Mint. Bullion will not be taken for coinage in lots of less than $100 in value, nor will it be taken if not approximately pure. As soon as the gold can be assayed, which process requires about 24 hours, returns will be made upon it. Persons offering bullion need not, therefore, wait until their particular metal is coined. Returns, if in gold, will be paid at the Mint; if payment is accepted in silver, the Mint will send the returns, at its own risk, to any place desired.

The Mining and Scientific Press is in receipt of a new and enlarged edition of a work which is fully described in the title pages as follows: "The Mine Foreman's Handbook of Practical and Theoretical Information on the Opening, Ventilating and Working of Collieries." The volume contains questions and answers on practical and theoretical coal mining, designed to assist students and others in passing examinations for mine foremanships. The author is Robert Mauchline, ex-inspector of mines in Pennsylvania and superintendent of coal mines. He considers the subject in a plain and practical manner and places his experiences and theories before the reader in excellent style. Such subjects as mine gases, safety lamps and instruments, ventilation, maps, pillars, mine timber, dams, railroad tracks, switches, etc., etc., are discussed in detail. There are many things in the work of value to the quartz miner. The pages are embellished with 114 engravings. The price is $3.75, and the publishers are Henry Carey Baird & Co., industrial publishers, booksellers and importers, 810 Walnut street, Philadelphia.

The Debris Commission.

The Anti-Debris Association gave ample evidence of the tactics it intends to pursue with reference to the Caminetti law, at the session of the Debris Commission, Monday, Sept. 4th. At that time, the public hearings on the applications of N. C. Tully and the Eureka Lake & Yuba Canal Company for license to mine by the hydraulic method at a mine on Scotchman's creek, Washington Township (Omega mine), and at the Farrel mine, Columbia Hill, Nevada county, respectively, were appointed to be heard. It developed at the hearing that the various applications are to be contested by the anti-debris people before the commission, where there is possible ground for objection under former decisions of courts; and in other cases it is designed to have a representative on hand to "watch" things. When the several documents pertaining to the two applications had been read, Attorney R. T. Devlin, of the Anti-Debris Association, called attention to the fact that the Farrel mine had been enjoined from operation by order of the Superior Court and its owner, Mr. Bigelow, fined for violation of law. Mr. Devlin also claimed that the petitioners asked leave to mine temporarily with the old dam, which had, by order of the court, once been declared insufficient to impound the debris.

Attorney Searles, for the petitioner, stated that the dam had been improved and strengthened and was quite strong enough to hold debris to its full capacity.

Major Heuer here interrupted by moving that the application be granted. He stated that Col. Benyuard and himself had inspected the mine and the dam. It was evident that the two commissioners consider that the dam is sufficient for all present requirements. The motion was taken under advisement.

Mr. Devlin also submitted a statement by Messrs. Striedinger & Von Geldern, the civil engineers, reviewing the plans and specifications of the impounding dam and waste weir. Certain discrepancies between the petition and plans were pointed out, and the waste weir was declared inadequate, and the structure as a whole, too low, too weak and too steep. The papers were filed with others to be considered by the commission.

It was to the application of Mr. Tully that Attorney Devlin urged the most serious objection. He submitted a statement that Tully was not the owner of the mine, which had been sold by the United Ststes Marshal under execution to Edward Woodruff, of Marysville. Mr. Devlin's proof consisted simply of a copy of the record.

Attorney Searles called attention to the fact that Tully had sworn that he was owner of the mine, and, in absence of any other documents to the contrary, his statement should be accepted without question. He further volunteered to say that Mr. Tully claimed ownership to the mine by virtue of a sheriff's deed, and had been in undisturbed possession for some years.

Mr. Devlin insisted upon the validity of the marshal's deed.

Chairman Mendell said that it was not the business of the commission to settle question of title. The law imposed no such duty upon the commissioners. The verified petition of Mr. Tully was *prima facie* evidence that he owned the claim and he thought the commission was not obliged to go behind that.

Mr. Devlin spoke at some length on the question of title, but the commission insisted upon its position of non-interference. The proper place to settle such matters was in the courts. Mr. Devlin said that if the commission granted Mr. Tully a license, it would virtually attempt to decide the question, for it would assume that he owned the claim. It was suggested to Mr. Devlin that he should present his facts and proofs in writing, and a final determination on the application would be deferred a reasonable time for that purpose. He was also given plainly to understand that his objections would not influence the decision of the commission. Mr. Tully's continued, undisputed possession of the claim, and his sheriff's deed were sufficient evidence that he had a right to operate the mine.

Attorney Devlin also presented a statement by Engineers Striedinger & Von Geldern relative to the plans of the impounding dam. The plans were objected to on various grounds, mainly because they did not sufficiently indicate what it was proposed to do, and also that the large amount of brush and wood entering into the construction of the dam did not insure its permanency.

The public hearing was then ended..

THE Senate Committee on public lands has favorably reported a bill granting to the State of California five per cent of the net proceeds of the cash sales of public lands in the State which have been made since the State was admitted, or may hereafter be made to aid in the support of public schools.

What Is a Proper Location?

The Supreme Court of Nevada has just decided a case of interest to mining men. Its title is J. Ponjade *et al.*, plaintiffs and appellants, *vs.* Pat Ryan *et al.*, defendants and respondents. The facts of the case are as follows:

The ground in dispute is situate in the Pennsylvania mining district, about 45 miles southeast of Pioche, and was formerly known as the Klingensmith mine, upon which the assessment work was not done in 1888, and early on the morning of Jan. 1, 1889, the defendants, Pat and James Ryan, located the ground as the Hope mine, and shortly after, the plaintiffs, J. Poujade and Chas. Roeden, located the same ground. The defendents refused to give up the claim, and plaintiffs brought suit, the main point in which was the validity of the Hope location. The case was tried before Judge Talhot, who gave judgment for the defendants. The plaintiffs moved for a new trial and Judge Talbot denied the motion, and plaintiffs appealed to the Supreme Court, and this decision is the result. It was rendered hy Judge Bigelow, Judge Murphy concurring. After finding against appellants relative to construction of the local statutes as to manner of appeal and jurisdiction of the court, the decision is:

The only other error assigned is that upon the admission in evidence of the notice of location of the defendants' mine. Upon this point the statement contains the following:

James Ryan, nne of the defendants swnrn nn hehalf nf defendants, testified substantially as follows: * * The nntice nf lncatinn nf the Hope mine is shnwn the witness, and he says: 'This is a duplicate nf the nntice we pnsted. We pnsted nurs nn a mnnument nn the claim, and had this nne recnrded.' * * Defendants here nffered in evidence a recnrded duplicate of the nntice nf locatinn nf the Hnpe mine, to which plaintiffs objected nn the grnund that it was insufficient, irrelevant, incnmpetent and immaterial, in that, being a recnrded notice, it is insufficient fnr lack of descriptinn, and that it dnes nnt identify the claim hy reference to a permanent mnnument or natural nbject.

We know of no law requiring a notice of location to contain a reference to a permanent monument or natural object. It is the record of the location that must contain this reference, and only then when the district laws require such record to be made.

There was no evidence offered concerning the local laws of this district, nor, indeed, does the recorded notice seem to have been offered for the purpose of proving compliance with any rule requiring recordation, but rather as the notice which was posted upon the mine as a part of the location thereof. As such, there was no error in admitting it. Without proof of a law requiring recordation, the fact that it had heen recorded made it no better nor worse than if it had not.

The appellants assert that it is a universal custom, applicahle to all mining districts, to require the recordation of mining locations, and, as we understand the argument, that we should consequently take judicial notice of its existence. We are of the opinion, however, that it has heen too often decided that the existence of rules and customs governing the manner of locating and holding claims in each district is to he established by the evidence in the case the same as any other question of fact to he now open to controversy.

The order appealed from ls affirmed.

The Derbec Drift Gravel Mine.

Samuel Butler, in course of an excellent article on the North Bloomfield mines, in the *Foothill Weekly Tidings*, thus explains the working methods of one of the leading drift gravel mines of the State: "The Derbec drift gravel mine is a consolidation of several claims and is now owned hy the Derhec Blue Gravel Mining Company, incorporated in 1877. This mine, which is situated one mile northwest from the town of Bloomfield, covers an extent of 621 acres. The mine is worked from a shaft having a vertical depth of 460 feet. The gravel, which is not cemented, is extracted to a depth of 10 to 11 feet. It is washed in slnices and has yielded on an average of $1.85 per carload of 1500 pounds, or $2.47 per ton, this heing the average for 11 years. The daily extraction is 270 carloads, equal to 200 tons.

"The first washing is through 600 feet of flume, the tailings heing retained in a creek hed by a hrush dam in order that they may "slack." This heing done, the dam is cut and the accumulated mass is ground-sluiced into a flume 4000 feet in length, adding 10 per cent to the total yield of the 600 feet of flume. The width of the pay channel at the present time is from 600 to 700 feet. It has heen found as small as 175 feet at some points. It has heen worked up the stream a distance of 3500 feet in a straight line from the shaft. Mules are used for transporting cars, timhers, etc., to the hreast of the tunnel. There are ahout 10 miners' inches of water in the mine, which is drained through a tunnel driven for the purpose and which drains the whole mine. The hoisting works contain a 40-horse power steam engine with two hoilers, and are well arranged and equipped. Flat cahles are used and the shaft is supplied with a douhle track. Safety cages are employed and the shaft remains covered hy a honnet until the cage comes up, and in this way accidents are avoided. Over $50,000 was expended in this mine before pay gravel was struck. Over 100 men are employed, with wages from $2.50 per day to $3. As soon as hydraulicking begins the Derhec Company will begin operations under that process. This mine has produced $2,880,000 during the present working."

Late Mining Decisions.

Following are recent decisions of the courts in mining cases:

When Examination of Party Before Action is Proper.—Where there is a doubt as to who were owners or operators of a mine at the time of an accident therein when decedent was killed, decedent's adminlstratrix is entitled to an examination of the superintendent of the mine before hringing an action for the death of decedent to ascertain such fact. *In re* Nolan, Supreme Court of New York, 24 N. Y., Supp. 238.

Right to Select Mineral Lands as Homestead.—Mineral lands of the United States which have heen located and used chiefly as a placer mining claim, though also used by the owner as a residence for himself and family, and to some extent for pasturing stock and raising vegetahles, may be selected, under the State laws, as a homestead; and the fact that such lands are reserved hy Acts of Congress from entry and sale, except as mining claims, and that title to them cannot he acquired hy pre-emption or homestead entry, is immaterial in a contest hetween a homestead claimant and his creditors, since, as between them, the title to the land claimed as a homestead is immaterial. The fact that the statute exempts from execution the dwelling of a mloer, not exceeding in value $500, and also his mining claim actually worked hy him, not exceeding $1000, does not preclude the right to select the dwelling and claim as a homestead. Gaylord vs. Blace, Supreme Court of California, 33 Pac. Rep. 484.

Rights of Locators of Tunnel Claims.—Where one duly located a tunnel under the Revised Statutes U. S., Sec. 2323, and discovers a mineral lode in the tunnel, he is not hound to make another discovery and location of the lode from the surface in order to he protected against a suhsequent surface location of the same lode. The above statute provides that the owner of a tunnel for the discovery of mines shall he entitled to the veins or lodes discovered in the tunnel to the same extent as if discovered from the surface. Sec. 2320 provides that a mining claim located after May 10, 1872, may equal hut shall not exceed 1500 feet along the vein or lode. Where one locates a tunnel and discovers a lode, he may claim 750 feet of the lode each way from the point of discovery. Ellet vs. Camphell, Supreme Conrt of Colorado, 33 Pac. Rep. 521.

Liability for Injury to Servant by Dangerous Premises.—A miner may recover for iojuries sustained hy the falling of a stone from the roof of the mine, although he knew the roof was llahle to fall in when he told the foreman of the mine of the danger, and the latter promised to have the roof propped; the miner having continued in the employment from day to day in reliance on such promise, and having been injured while about to quit work hecause of the neglect to prop. Breckenridge Co. vs. Hicks, Court of Appeals of Kentucky, 22 S. W. Rep. 554.

The Anti-Debris Association.

At the recent annual meeting of the Anti-Dehris Association, at Yuha City, it was decided to continue the organization for at least another year, as there is still some unfinished husiness to attend to. An address hy President C. E. Stone was read, in whlch he said in part:

I am of opinion that the [Dehris] Commission should not be interfered with hy either the miners or the valley residents, and that should a delegate from this association be present it should only he for the purpose of giving information as to previous conditions, should the Commissioners desire such information.

The U. S. Government now having charge of hydraulic mining, we should allow the Government Commissioners to conduct their operations in their own way, as we know they are entirely independent and interested only in the preservation of rivers and harhors.

After obtaining a license to mine many of the miners will he disposed to exceed the limits as to deposits of material, and it will be in order for our association to send out watchmen to ohtain evidence, that the Commission might be notified as soon as their rules were violated, that proceedings may he had in the courts at the earliest moment.

To Prevent Overwinding.

Ockwell Hawkins, one of the managers of the Treharris Colliery, England, has patented an invention for preventing the cages of a pit from falling should the rope snap or slip off the sheave while they are being lowered or raised. The device is simple in its construction. The apparatus is riveted to the side of the top part of the frame of the cage, extending from corner to corner, at each of which is the appliance for gripping the two iron or steel guides running from the top to the hottom of the shaft when the rope hreaks or becomes detached while the machinery is workIng. The appliance forms no impediment whatever, and can he fixed in a very short time to the cage of any pit. The greater the weight of the cage and its load, the greater or firmer is the grip of the appliance. The cost of the appliance ls very small, for lt is made of iron and contains no delicate mechanism in any part of it.

Lowest Cost of Mining and Milling.

TO THE EDITOR:--If you have the data at haod, I will esteem it a great favor if you will let me know how cheaply ore can he extracted and milled under the most favorahle conditions, citing lnstances. L. L. MYERS,
Supt. S. V. G. Co.

Cherokee, Butte Co., Cal, Aug. 21, 1893.

The query of our correspondent opens up a very interesting suhject, to which some research has heen devoted in securing a satisfactory answer. The Treadwell mine in Alaska probahly secures hetter results from low-grade ore than any other large mine in the world. The Treadwell is practically an open qnarry. The report of the Alaska-Treadwell Company for the year ending May 1, 1893, shows that the quantlty of ore crushed was 237,235 tons, ylelding an average of $2.13 cents in free gold. There were 4276 tons of sulphurets saved hy concentration and 4584 tons treated, giving an average of $41.28 per ton. The average for all the ore treated, lncluding yield from sulphurets, was $2.94 cents per ton.

The cost of work last year is given very fully ln the report. Mining (237,235 tons), cost for lahor, 39 60 cents; supplies, 20.74 cents; total, 60.34 cents per ton. Milling (237,235 tons), cost for lahor, 18.37 cents; supplies, 25 60 cents; total, 43.97 cents per ton. Chlorinating concentrates (4584 tons), cost for lahor, $5.3432; supplies, $3.649; total, $8.9922 per ton. Averaging all costs on the ore mlned, the result was: Mlnlng, $0.60; milling and concentrating, $0.44; chlorlnation, $0.17; general expenses at mine, $0.07; San Francisco office, $0.02; hullion charges (freight, insurance, etc.), $0.05; total, $1.35 per ton.

Prohahly the cheapest milling of ore ever accomplished ln the world was hy the use of a roller mill at the Spanish mine, Washington township, Nevada county, Cal., four or five years ago. The circumstances were exceptional, hut the results show what may he accomplished under similar conditions.

At this mine the vein averages 90 feet. The hanging wall is a slate, soft, shaly and not well defined. The true vein ls on the footwall and consists of solid quartz, four feet thick. It does not pay for working. The pay is found on the hanging-wall side, which contains many veinlets and streaks of ferruginous quartz carrying gold. Where no quartz is to he found there is no pay. The slate on this, the west, side is talcose.

The main tunnel was ln 1200 feet. The vertical distance from the surface to the end of the main tunnel was 350 feet. One of the methods of extracting ore here was as follows: There was an excavation from the tunnel to the surface which acquired the form of an open cut with sloping sides, too steep for a man to stand on; a Chinaman, armed with a churn drill, was lowered by a rope; he drilled a hole which, when deep enongh, was charged with ahout five pounds of powder and fired, causing a large quantity of the soft slate to slide to the bottom, whence it was taken out throngh the tunnel. The mine employed a foreman, two white men, and eight Chinamen, who extracted ahout 4000 tons of ore a month, enough to keep the mill at work. The wages paid were: White men, $3 per day; foreman, $3.50, and Chinamen, $1.50 per day.

The ore obtained came out of the tunnel hy gravity, the empty cars heing hauled back by mules. The ore was passed through a Blake rock hreaker and then ground in a Huntington roller mill, of which there were three of five feet diameter and one of four feet. The mills, whlch made 58 revolutions per minute, were fed hy Hendy automatic ore-feeders.

The following record of one month's run of the mine may he taken to indicate the low cost of working the ore, and to show also how very low grade an ore may he profitably treated when the conditions are all favorahle:

MINE—COST OF PRODUCTION.

[Run: 28 days' work produced 3443 tons of ore.]

	Labor.	Supplies.	Total.
Extracting ore	$703.50	$113.41	$816 91
Delivering ore to mill	160.20	17.95	171.15
Dead work	105.20	10.93	116.13
General expense	78.35	1.95	80.30
Total	$1.047 25	$144.24	$1,191.49
Cost per ton	.304	.042	.346

MILL—COST OF REDUCTION.

[Run: 24½ days reduced 3443 tons of ore.]

Mill expenses	$227.32	$194.33	$421.65
Water for power	.....	161.70	161.70
Handling ore	154.50	5.35	159.85
General expense	78.40	1.95	80.35
Total	$460.22	$363.33	$823.55
Cost per ton	.133	.106	.239
Bullion produced	.....	.....	$3.138.55
Total expenses	.....	.....	2,015.04
Profit			$1,123.51

It will he seen from this that the ore only yielded a trifle over 91 cents per ton, yet a profit of 32.6 cents per ton resulted. The percentage of profit was 35.8 of the total. In the previous month 2796 tons of ore were worked, whlch yielded $1.16 per ton. The profit was 56 cents per ton, or ahout 48 per cent of the total. The prcfit that month on a yield of $3,268.49 was 1,572.91. The cost of mining was 37½ cents and of milling 23 cents per ton.

The Mines of Siskiyou County.

With the late renewed attention to gold mining in California, there ls an excellent prospect that the mines of Siskiyou county will contrihute even a larger share of the gold ou'put of the State. Siskiyou has earned a record for steady production not surpassed hy many other counties, and it is destined to occupy even a more important position in the industry. It is doubtful if the mines have ever heen in hetter condition or if the outlook was ever more encouraging than at present. The Yreka *Journal* of late date contains a review of the mining industry in Siskiyou county, from which the following is taken:

The Klamath river, with its trihutary streams, Shasta, Scott and Salmon rivers, furnish the main hullion-producing sections of our county. From all these come the most flattering reports of the gold yield of the present season. The gravel banks on the Klamath for its entire length in this county, or to where it reaches the upper edge of the gold helt, has paid splendidly.

The Heald mine, whlch has heen successfnlly worked for the past 25 years, is still worked with good results.

The company of Chinamen working Dillon's have realized for the season's run $15,000.

The Elliott Brothers at Cottage grove are running their mine with good success.

Ock & Co.'s mine, located at Happy Camp, has yielded this season (with a small head of water) upwards of $20,000.

While not heing ahle to give the yield of the Muck-a-Muck mine, the sum is known to he greater than in former years.

Higher up the river the Gordon and Reeves mines are paying well.

At Thompson creek the Shiner Brothers are working successfully with hut a limited supply of water, while at Sciad, the famous Fort Goff mine is now one of the steadiest and hest paying claims on the river.

At Portuguese Bar, the Girder mine and Captain Jack Lowden's mine are heing worked to advantage.

There are hut few of the mines on the Klamath that are not paying handsome returns under the improved system of mining. From Cottonwood to where it leaves our county, something over 100 miles, the ground is being worked almost the entire distance, with still numerous hanks of gravel or former channels of the river inviting capital.

Rich as has heen the yield of this famous stream, it does not surpass that of other sections of the county.

The Montezuma and Messner mines, located at the head of Scott river, in the South Fork mining district, have yielded to their owners for the present season's run over $20,000, with work still heing prosecuted.

Eastick Bros.' mine, in the Oro Fino mining district, with a run of 41 days, during a portion of whlch time hut one giant was used, yielded $15,460, while Wright & Fletcher's mine adjoining is glving good returns for the amount of bedrock cleaned. Experienced miners say that these mines never looked better than at the present time.

On the opposite side of the ridge, in the Quartz Valley mining district, the R. H. Campbell Gold Mining Company are making this season one of the most successful runs ever made in this celebrated mine. It is estimated that the company will realize upward of 25,000, with the main portion of the paying ground yet to he opened.

In the Salmon River district the gold yield will surpass that of last season, which will prove it to be one of the best mining sections in our State. Not only have the mines in active operation made heavy hullion shipments, but new and extensive enterprises are heing started in nearly every locality, which will no donht pay handsome returns in the near future. The trouhle has been thus far in onr county that many of our finest mines have heen located and are now being held hy men who have no means to work them, consequently they have remained undeveloped. But this is fast changing now, and men of means are opening up some of these heretofore dead properties.

Alex Parker & Sons, of Etna, have spent some $15,000 in hringing on water and fitting up the Red Hill placer mine on Salmon. So well pleased were they after two short runs that they at once commenced the work of hringing on the second ditch, and will in the end no doubt make it one of the hest-paying mines on the Salmon.

A company is now talking of opening up the old hack channel of Scott river, in the South Fork mining district, for the purpose of making a hydraulic propositlon out of it.

This channel reaches from near the old A B C claim, oo Fox creek, down the river for a distance of nearly four miles. It is some 80 feet ahove and ahout the same distance back from the present river bed. At different points it has heen drifted into and good prospects found. Now that the main river bed has been worked, thus furnishing an unlimited dump, this is a practicahle plan of working this ground from which enormous yields will be made for years.

On Humbug creek, which paid so well in olden times, numerous rich quartz mines are now being opened and worked with success; also at the Schroeder & Werner group of mines at the head of the East Fork of the Deadwood, which fed the East Fork.

Can anyone doubt for a single moment, upon investigation, that the ledges which cross Scott river, a short distance ahove the town of Scott Bar, must have made this mining camp (one of the richest ever found in the State) what it is?

Here are five or more parallel veins, varying in thickness from two to five feet, crossing Scott river in a northeasterly and sonthwesterly direction, dipping easterly. They are commonly known as Quartz Hill, for the wearing away of the soil by the action of the water has left a mountain of quartz exposed to view. Originally these were many hundred feet higher than at the present time, and Scott river cutting through them at this point gradually wore away the quartz and deposited the gold in the channel of the stream helow. Ahove this point no gold is found in paying quantities. Below is one of the richest mining sections in California. Quartz Hill is now owned and heing worked hy the Scott Bar Mill and Mining Company. The mine has for a number of years heen worked hy former owners as a hydraulic claim, with good results, hut it has heen the intention of this company to sink shafts and drive lateral drifts into these veins of quartz. Should this he done, and a suitahle mill constructed capahle of crushing from 100 to 200 tons of quartz daily, we would yet see Quartz Hill one of her greatest mines. Although with the old system of hydraulicking they still make fine returns from the surface of these veins as deep down as they have ever worked them, yet it cannot he long hefore enterprise and capital will open this mine and make it yield up its store of hidden wealth.

Various Processes of Ore Reduction.

An account of different processes for the treatmeot of ores has not hefore heen presented to our readers at one time. A statement of several of different methods, part of which are used in California, others in South Africa and elsewhere, will give an opportunity for comparison, and may perhaps lead to judgment as to which is the hest. Omitting the cyanide process, we condense from London *Machinery* a careful and exact article on the subject:

Plattner's Process.—The ore is first roasted to effect the elimination of the sulphur, antimony and arsenic. The roasted ore is then put in a vat, and chlorine gas, which is made in a separate compartment, is passed into it. The gas transforms the gold in the ore into a chloride, which is then dissolved in water and carried out of the ore hy filtration into precipitating tanks, to which some precipitant is added. The metal is then collected from the hottom of the vats, whence it has fallen as a finely divided powder. Of all the chlorination—or, indeed, any other—processes, Plattner's ls prohably even now the most generally used. In the important mining districts of California and New Zealand there are chlorination works, the average charge of which for treatment is $20.20 per ton of concentrates, 90 to 92 per cent of the assay value heing guaranteed. The cost of a chlorination plant, with a capacity of six tons per 24 hours, ls estimated at from $6000 to $7000.

Newbery-Vautin.—The Newhery-Vautin process is Plattner's, plus an air pump. This patent claims to treat the concentrates with chlorine, or other equivalent reagent, in the form of gas or in solution, applied under a pressure greater than that of atmospheric air. An air force-pump is used, which communicates with the harrel containing the ore. The concentrates are agitated hy rotation, and, after being subjected to the action of the chlorine for a sufficient time, are passed into a filtering vessel. The solution is drawn through the filter hy means of a suction pump. From the suction pump the solution is discharged into a vat, through which air or steam is passed, and then through a filter consisting of alternate layers of rough and fine charcoal. The solution rapidly decomposes on the charcoal, and the gold is readily ohtained. The Newhery-Vautin process has not made much way on the Transvaal gold fields, hut it is not yet demonstrated that it is not perfectly feasihle.

The Pollak.—This is another chlorination process, in which variations from the original type supplied hy Plattner are all directed toward ohtaining the maximum of pressure in the vessel containing the ore. In the Pollak process this is developed by hydraulic means. The ore is first roasted to expel the sulphur, and is then placed in a cylinder with a lead lining. Bleaching powder and acid, or bleaching powder and acid sulphate ot soda, for the liberation of chlorine, are then placed in the cylinder and water is admitted under pressure until the pressure within the cylinder reaches 100 pounds to the square inch. The cylinder ls rotated to from half an hour to an hour, and the gold is then found to have dissolved, the pressure having forced the chlorinating fluid into the pores of the ore. This is all that is distinctive ln the process, the remaining stages of the treatment heing more or less common to all the other chlorinating methods. The Pollak has done hut little actual work on the South African fields so far, hut a plant was erected at the May Consolidated, where operations have heen conducted.

The Hungarian.—This is a process which has heen at work for many years on the Hungarian gold mines. In this process the roasting is finished hy an addition of salt to the hot charge, in order to effect a chloridizing roast. The roasted pulp is then treated with a solution of hyposulphite of lime for the solution of the gold. It is claimed that it is as effective as any of the other processes, and that the cost is very considerably cheaper, hy reason of the saving effected in the chemicals. A small plant was erected on the Robinson mine, ln the Transvaal, some time back, and the results are said to have been in every way satisfactory. A larger plant has since been erected by the Ore Reduction and Smelting Company at Driefontein. The company has not attempted to work on royalty, but has hitherto confined itself to purchasing tailings and treating them. The company has also introduced the amalgamation by bichlorlde of mercury, which is a soluble salt of mercury, and a pattern of concentrating tables—some of which are at work at the Robinson—from which it is claimed better results are obtained than from the ordinary Frue vanners.

Adair-Cruickshank.—It is now hardly an open question that pyritous ore is for the most part not refractory—that is

to say, that there is no actual chemical union between the pyrites and the gold. Under a sufficiently powerful microscope, the section planes of the pyrites, and the line of demarcation between it and the gold, can be plainly discerned, and it follows that, by dividing the ore finely enough, no difficulty is presented to amalgamation in the ordinary way. The Adair-Cruickshank process merely consists in grinding the ore by an ingenious arrangement of rollers into an impalpable powder, and then amalgamating. There can be no doubt that in the majority of cases this process is perfectly effectual, but the objections appear to be that for driving the machine, power and skilled labor are required, and that gold can only be recovered in certain of its combinations. So far, however, no difficulty in recovering has been experienced, aod the question resolves itself wholly into one of cost. Under favorable conditions, in which some cheap form of motive power is available, it is probable that the Adair-Cruickshank would be exceedingly inexpensive.

Molloy's Patent.—The hydrogen amalgam process, which has been patented by Mr. B. J. Molloy, M. P., is a method by which the mercury is kept alive and "quick," and a constant contact is maintained between each separate particle of gold and the effective mercury. The apparatus consists of a shallow pan about one inch in depth and 3½ feet in diameter, containing mercury about half an inch in depth. In the center of the pan is a porous jar, so fixed that the mercury cannot enter or move it. Within the jar is a cylinder of lead and a solution of sulphate of soda. The cylinder is connected with the positive pole of a small dynamo, and the mercury with the negative pole, and when the current passes, decomposition of the electrolyte, formed by the solution of soda, sets in, oxygen being evolved from the surface of the lead and hydrogen from the mercury. The mercury combines with a portion of the hydrogen, and so forms a hydrogen amalgam, while the excess of hydrogen so formed passes away. While the mercury is charged with hydrogen it cannot oxidize, because of the presence of an excess of hydrogen, and the mercury is thus kept quick and always capable of absorbing the gold into itself. The pulverized ore is brought into contact with the active mercury by means of a revolving disc in the pan, which is just large enough to leave a narrow channel of mercury uncovered. The pulverized ore as it leaves the stamps flows into the hopper accompanied by a stream of water, and is carried under the revolving disc by centrifugal action, and is then rolled round the mercury until it reaches the outer channel between the edge of the disc of the pan. Then, when it is freed from the pressure of the disc, the ore floats over the edge of the pan, and passes away, leaving in the mercury all the amalgamable gold. This perfect extraction is due to the rolling action, which separates each particle of ore, and rolls it for some ten seconds in the quick mercury. The increased quantity of gold extracted by this process is said to be never less than ten per cent, and it is claimed that the whole cost of treatment amounts to only 8 cents per ton, for electrical and mechanical force, and for labor. Excellent results are said to have been obtained on a small scale from the Selati gold fields, and the process is now at work at the Wemmer, in conjunction with the Adair-Cruickshank process.

Accident Insurance for Miners.

The Lehigh & Wilkes-Barre Coal Co. has just made a proposition to its employes, whereby they or their families will be protected in case of accident or death, says the *Coal Trade Journal*. Notices have been issued to the employes stating that the largest capitalized accident insurance company in the United States has presented a plan for insuring all the coal company's employes at a nominal cost per month, and the workmen are urged to accept the proposition. Some of the company's employes carry accident insurance, and it is for this reason, the officials say, that they urge every employe to acquiesce to the adoption of the new scheme. The cost of the insurance to the employes will be as follows: Employes receiving $25 per month, 50 cents per month; employes receiving $30 per month, 60 cents per month; employes receiving $35 per month, 70 cents per month; employes receiving $40 per month, 80 cents per month. Those receiving other wages will be assessed in like proportion.

If the plan is accepted, the coal company will at once pay the full premium of every policy, deducting a small amount every pay day until the full amount has been refunded—that is, the coal company will advance the whole premium for the entire year, but the employes' share of the premium will only be deducted each pay day. The plan is not made compulsory, but is left to the intelligence of the employes. The benefits to each employe will be as follows:

(A.) If accidentally injured while at work, at home, on the streets, on the railroads, or elsewhere, you can draw one-half of your wages each pay day during total disablement for a period of 50 weeks, the company furnishing medical attendance free.

(B.) For the loss of sight of one eye; loss of one hand or one foot, by actual separation, you will receive one-quarter of one year's wages, the company furnishing medical attendance free.

(C.) For the loss of sight of both eyes, or loss, by actual separation, of both hands or both feet, or one hand and one foot, or the loss of one hand or one foot, each accompanied by the loss of sight of one eye, you will receive one-half of one year's wages, the company furnishing medical attendance free.

D.) If death results from an injury within three months of date of accident, you will receive one-half of one year's wages, the company furnishing medical attendance free and funeral expenses.

South African Gold Output.

The activity of the mines in Witwatersrand, South Africa, shows no diminution; but, on the cootrary, the output of the district is steadily increasing. It is now clear that the record for 1893 will be somewhere in the neighborhood of £5,500,000 sterling, exceeding the estimates of experts. The July output has beaten the record with 126,169 ounces, against 122,907 for June and 116,911 for May. We have not received the figures in detail for the July output, but for June they are as follows: 122,907 ounces, 8 dwts.; value, £432,163.

The cyanide process is a very important factor in the prosperity of the Witwatersrand mines. Its use in the district is controlled by the African Gold Recovery Company, Ltd., which works a large number of mines by the process. Some old tailings are being worked over. A statement of June results by the cyanide process is appended:

AFRICAN GOLD RECOVERY CO., LIMITED.

June Production.

	Ozs.	Dwt.
Crown Reef G. M. Co., Ltd.	1,839	14
New Rulfontein Est. G. Mines, Ltd.	1,323	10

Eastleigh Syndicate (Kleiksdorp)	265	5
Grand total	27,597	

In view of these results there should be no doubt of the value and efficiency of the cyanide system. It ought to come into general use in California. The South African miners have taught California miners a valuable lesson.

The Diamond Drill in Arizona.

The annual report of W. F. Staunton, superintendent of the Tombstone Mining and Milling Company's properties for the past year, has the following relative to the diamond drill: "Our use of the diamond drill covers a period of about 14 months. The first work was in the Lucky Cuss mine, using compressed air as motive power. Twenty-one holes were bored at this time, of an average depth of 116 62 feet, aggregating 2449 feet. Time of actual boring, 155.5 days of 10 hours. Average rate of boring per day, 15 75 feet. The cost was as follows:

	Total.	Per Foot.
Labor, including removals	$1,736.00	$ .708
Supplies	1,180.97	.482
Carbons	1,325.05	.541
Total, boring and removals	$4,242.02	$1.731
First cost of machine, less carbons	3,794.24	1.549
Total cost, includ. purchase of machine.	$8,036.26	$3.280

"The next work was a vertical hole on the Gilded Age claim to test the formation, and involved the sinking of a shaft 92 feet deep to reach rock of sufficient firmness to use the drill. A hole was bored to a depth of 354 feet below the bottom of the shaft. The cost was as follows:

	Total.	Per Foot.
Sinking shaft 92 feet	$1,298.54	$14.11
Boring 344 feet	1,266.56	3.68
Total 436 feet	$2,565.10	$ 5.88

"Finally seven holes, aggregating 259 feet, were bored in the Lucky Cuss sixth level, No. 3 winze, with a small machine purchased for the purpose, using hand power at first and afterward compressed air. The cost was $513.34 ($1 98 per foot), or, including the first cost of machine, $990.91 ($3.44 per foot).

"Summarizing the above figures we find that, exclusive of the first cost of the machinery and the cost of sinking the shaft, there has been expended on diamond drill work $6021.92, or $1.97 per foot. The grand total of expenditures on account of diamond drill work is $11,592.27, or $3.68 per foot drilled. The results obtained are not such as to encourage the continued use of diamond drills."

What is the Fastest Train on Earth?

TO THE EDITOR:—Americans are too prone to think they have the fastest express in the universe. Error! True, for long-distance running, the 90-hour flyer from the East to Chicago can't be beat, but then those engines are frightful coal-wasters, burning 45 pounds per average mile and minute, so that the "exposition flyers" are run at a heavy loss. Nothing like "prestige," however! Now, on the fastest British road, the locomotive draws 100 tons more, goes 10 miles an hour faster (for the short distance run of under 200 miles), yet does not burn half the coal of the wasteful American crack trains.

For years I have devoted attention to this subject, and have always been surpised at the ignorance of every community in the matter. Indisputably the English Great Northern has the fastest regular trains of any line on the globe; and the fastest in the world is that quitting Grantham (shire of Lincoln) every afternoon at 4:18 and reaching London, on scheduled time, at 6:15. The distance is 105¼ miles and the run is made without a stop.

I wanted to verify for myself this speed, so obtained a permit from Mr. Stirling to make the return journey to London on his masterpiece. The engine was boarded and Grantham left at 4:22 (four minutes late). Some 15 miles out the maximum of speed was attained and maintained throughout (one exception). This was as nearly as possible one mile per minute. The exception was in running through Peterboro, when the speed did not exceed 25 miles. Through all other stations, big and little, the engine and 16 carriages swept without the slighest reduction in velocity. The night was dark and foggy and nothing could be seen (except signals) 50 yards ahead. A dozen miles from London speed was gradually reduced and King's Cross run into exactly on schedule time, viz., 6:15. This four minutes had been made up and the 105¼ miles done without a stop in 1 hour and 55 minutes.

The English Great Northern has several trains running each way, daily, without stopping, between London and Grantham. There is one leaving King's Cross at 2 P. M., and reaching Grantham at 3:59. The others cover the journey in from 2 hours and 2 minutes to (with one or two stops) 2 hours and 10 minutes.

Owing to the steady motion of the cars one does not feel at all like being carried along at 50 miles an hour. On Mr. Stirling's 8-foot chief-d'œuvres, however, the traveling is rather different. There the vibration is in pretty full force. Naturally, the locomotives having outside cylinders, they have not the steady running of insiders.

During the nearly two hours' run from Grantham to London I noticed that neither driver nor fireman exchanged a solitary word, and as I (after handing over the engine pass) had no inclination to speak, we were all three "mute as mice" throughout the long run. The driver stood motionless at his post, only varying his position to bend down for a moment to the lamp, watch in hand, to note the time. About every five minutes the fireman shoveled in a half-hundredweight of coal, for these engines consume their full quota, and more, although the precise consumption is not at hand to give here. As for myself, I stood up in the left-hand corner of the cabin, having everything under view, yet obstructing nobody's view. I have the happy faculty of knowing how not to be in the way on a locomotive—of being practically *non est* while actually there.

There is a notable feature in connection with the departure of Great Northern express trains which I have never noticed on any other railway system in the world. No time-taking engineer who has studied this, the fastest transit railroad on the globe, will have failed to remark the particularity. I refer to this: That no sooner is the train started than it is almost instantly in full flight and out of sight. Take flying Scotch departs from King's Cross, for example. Ere you have noted your stop-watch seconds locomotive and cars have vanished! It is this facility for getting away at great speed which gives the Great Northern locomotives such a hand over other companies' engines, which (in comparison) dawdle out of their respective termini.

My experience of Great Eastern petroleum and coal-fuel locomotives causes me to accord a verdict in favor of the former. I have tried some of the Great Eastern's fastest engines. The best speeds are those between London and Cambridge—58 miles in 1¼ hours. This is quick running for the Great Eastern, which, however, has never acquired celebrity for very quick runs. In the run to Cambridge the engine gave some ugly lurches when sweeping round curves, almost staggering the occupants of the cab ("engine-legged" as they were). From Cambridge I walked across country to Buntingsford (22 miles) in 5½ hours, and rode back to London on one of the small engines used on that branch. LODIAN.

Chicago, August 7, 1893.

Important to all Applicants for Engineer's License.

A New Revised and Enlarged Edition of

EDWARDS' EXAMINATION QUESTIONS AND ANSWERS

JUST READY.

Edwards' 900 Examination Questions and Answers for Engineers and Firemen (Stationary and Marine) who desire to obtain a U. S. Government or State License. By Emory Edwards, Marine and Mechanical Engineer.

A New, Revised and Enlarged Edition, 250 pages. Full bound, in pocketbook form, leather, gilt edges. Price $1.50, by mail, free of postage to any address in the world.

☞ *A circular showing in full the very elaborate index to this important book will be sent free of postage to any one who will apply.*

BY THE SAME AUTHOR.

The Practical Steam Engineers' Guide in the Design, Construction and Management of American Stationary, Portable and Steam Fire Engines, Steam Pumps, Boilers, Injectors, Governors, Indicators, Pistons and Rings, Safety Valves and Steam Gauges. For the Use of Engineers, Firemen and Steam Users. By Emory Edwards. 110 Engravings. 420 pages, 12mo Price.....$2.50

TENTH THOUSAND.

The American Steam Engineer. Theoretical and Practical; with Examples of the Latest and Most Approved American Practice in the Design and Construction of Steam Engines and Boilers of Every Description. For the Use of Engineers, Machinists, Boiler Makers and Students. By Emory Edwards, M. E. 77 Engravings. 12mo, 419 pages. Price.....$2.50

Modern American Marine Engines, Boilers and Screw Propellers. Their Design and Construction. Showing the Present Practice of the Most Eminent Engineers and Marine Engine Builders in the United States. By Emory Edwards. Illustrated by 30 large and elaborate plates. 4to. Price.....$5.00

The American Marine Engineer. Theoretical and Practical; with Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By Emory Edwards. 85 Engravings. 12mo. 435 pages. Price.....$2.50

A Catechism of the Marine Steam Engine. For the Use of Engineers, Firemen and Mechanics A Practical Work for Practical Men. Illustrated by 63 Engravings, including Examples of the Most Modern Engines. Fifth Edition, thoroughly revised, with much new matter. 12mo, 414 pages. Price.....$2.00

Modern American Locomotive Engines. Their Design, Construction and Management. Illustrated by 78 Engravings. 12mo, 383 pages. Price.....$2.00

☞ *The above or any of our Books sent by mail, free of postage, at the publication prices to any address in the world.*

☞ *Illustrated Circulars, showing full Tables of Contents of all of the above Valuable Books, will be sent free to any one in any part of the world who will send his address.*

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, as well as our other catalogues and circulars, the whole covering every branch of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish his address.*

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is heavily illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 166 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Mechanical Progress.

Tests of Portland Cement.

At the recent congress of mechanical engineers in Chicago, in the discussion that followed a paper by Mr. Henry Faija on "The Manufacture and Testing of Portland Cement," Mr. Griffith, an English engineer who has long been engaged on marine harbor work, in which the use of Portland cement was an important feature, said that of late years there has been a tendency to use a light burnt cement to facilitate grinding, but this is a very unsafe practice. Standard tests should be as simple as possible, so that they may be carried out by engineers where laboratory appliances are not available. The saod test is not generally used in England, though used in Germany. Captain Black said that at St. Augustine, Fla., he had used a concrete of one part good cement, two parts sand, almost all silica, and four parts coquina gravel (small shells) in place of stone. Concrete made thus, and remaining in air, was in perfect condition after two years. That laid in water was soft and worthless, and that made in air and then placed in the water was also soft. He thought this to be probably the case with many concrete foundations, but, as the margin of safety is so large, it is improbable that this will ever be found out. On a concrete seawall of Resendale cement, in Florida, where puddles of seawater on the top were exposed to a very hot sun, the concrete under the puddles was so soft that a knife could be pushed into it, but on the face of the wall, where the water had no lodgement, the skin of the cement remained quite hard. Where a concrete face was exposed to the action of surf, it was abraded by the action of the sand in the surf. The interior of a cement test pat will harden later than the exterior.

The Malleability of Iron.

The mill manager of Messrs. W. Hallam & Co. of the Upper Forest Tin Works, near Swansea, succeeded in making a sheet of the finest appearance and thinness that has ever yet been seen by mortal eye, says the *Paper-Makers' Journal*. The iron from which the sheet was rolled was made on the premises. It was worked in a finery with charcoal and the usual blast; afterward taken to the hammer to be formed into a regular flat bottom; from thence conveyed to the balling furnace, and, when sufficiently heated, taken up to the rolls, lengthened and cut by shears into proper lengths, piled up and transferred to the balling furnace again. When heated, it was passed through the rolls, back again into the balling furnace, and, when duly brought to the proper pitch, was taken to the rolls and made into a thoroughly good bar.

It was then taken to the tin mills and rolled till it was supposed to be thinner than 23 grains, afterward passed through the cold rolls to give it the necessary polish, and it stands on record as the thinnest sheet of iron ever rolled. The sheet in question was 10x5½ inches, or 55 inches in surface, and weight but 20 grains, which, being brought to the standard of 8x5½ inches, or 44 surface inches, is but 16 grains, or 30 per cent less than any previous effort, and required at least 4800 to make one inch in thickness.

Four-Day Atlantic Steamer.

Thomas A. Edison is represented as believing in a four-day ship between New York and Queenstown, and as thinking that the Campania could make the journey in that time if it were not for the greatness of the amount of friction between the water and the sides of the vessel. This he believes will, in time, be largely reduced, and he has himself tried many experiments having that end in view. One of these was to have hydrogen gas produced along the sides of the vessel by electricity; but while this method worked admirably in artificial salt water, it would not operate with the brine of the ocean. He suggests the possibility that oil may in some way be mechanically applied to the hulk, so that the friction will be reduced to a minimum. When this has been accomplished, the ocean racers will plow through the waves as if they were birds going through the air, and the two continents will be brought nearly a thousand miles nearer together.

Penny-in-the-Slot Gas Meters.

Automatic gas meters, which are put in operation by dropping a penny (two cents) in the slot, are in use in Liverpool, England. There are in view of the householder three dials marked: "L," "S" and "D," and as soon as a penny is dropped into the slot the hand of the "D" dial records it. When 12 pennies have been dropped in, the "D" dial stands at "0," while the hand of the "S" dial records that one shilling's worth of pennies are in the drawer, and so on until £20 ($100) worth of gas is paid for. The hands can only move one way, so that by this invention the householder practically gets an indisputable receipt for the pennies he puts into the slot and the total amount he has paid for his gas. An indicator shows how many feet of gas are in the meter "paid for, but unconsumed." When all the gas paid for has been used the flame does not at once go out; but under a new arrangement the meter automatically warns the householder that the supply is nearly exhausted by gradually lowering the flame at least one hour before turning the gas off.

New Style of Scales.

A new pair of scales for the purpose of weighing tin is attracting attention in Australia, having been recently added to the equipment of the Mount Bischoff Smelting Works. They are designed upon the lever and beam principle, and are in effect an exaggeration of the balances employed by bankers. The scales, which are suspended from the beam by a center bar, are constructed of large, square plates, upon which the metal or weights can be placed with a facility which the corner chains generally used do not afford. A block is placed under each plate for the convenience of those handling the heavy material, in order to obviate unnecessary stooping. The scales are hung on steel bearings, with box and swivel ends. They are, moreover, so nicely poised that, although they could, if required, bear a strain of five tons, a few ounce weights will depress either side. The scales are raised from the blocks by means of hauling tackle, which moves the lever so easily that the work could be accomplished by a little child.

To Overcome Severe Grade.

Cases sometimes happen in the location of a street railway in which a very severe grade is unavoidable for a short distance, while the remainder of the line is comparatively level. To meet this condition of affairs a very ingenious device has been invented, and has been for more than two years in successful operation on a line in Seattle, Washington, says the *Engineering Magazine*. For a distance of 1000 feet there is a grade varying from 11 to 16 per cent. Two counterbalance weights, aggregating six tons, run on rails laid in a conduit underneath the track. These weights exactly balance an empty car and are attached to wire ropes running over pulleys. At the top of the grade, on its way down, the car picks up the rope and in descending hauls the weights up, thus checking its own speed so that the breaks will hold the load without difficulty. At the foot of the grade the conductor disengages the rope by a hand-lever. Going up, the connection is made automatically, and disengaged in a similar manner. A grade of 20 per cent may be readily overcome by means of this simple and admirable expedient.

Annealing Steel.

T. C. Lace, of Glenwood, Pa., in a communication to *Sparks*, thus discusses the annealing of steel:

In the majority of cases this is not well done. Sometimes steel is heated and thrown on the floor, perhaps in a draft or possibly it is buried on the forge or in something which will cool it as quickly as if it were in the air. A very good bed to anneal in is wood ashes or dry sawdust, but the first is the best as it is neutral. A low red heat will take all the hammer strains out of steel, but do not remove until cold, and above all do not heat too quickly to anneal, as there is no doubt that, in annealing, the inverse of the process of hardening is going on, not so violently perhaps as in hardening, yet at a certain rate, nevertheless. By this hasty heating I have broken steel, and not highly carbonized tool steel, but of course small sizes are less subject than large pieces to the action of the fire.

Scientific Progress.

Dr. Nansen's Polar Expedition.

After three years' preparation the Polar expedition under Dr. Fridtjof Nansen has finally sailed from Christiania, Norway, for the North in the good ship Fram (Advance), the first vessel that has been especially designed and constructed for Arctic research, says the London *Graphic*.

The party consists of twelve men, including Dr. Fridtjof Nansen, as leader of the expedition; Lieutenant Scott Hansen, R. N., as scientific member; and Henrik Blessing, M. D., as surgeon and botanist.

The expedition sails in the vessel Fram, which is a model of strength, but she is a trifle too small for the enormous amount of stores with which she has been loaded and which have brought her so down in the water that the ice sheathing has had to be heightened, while giving her hull the appearance of something between a Dutch koff and a Thames barge. The accommodation on board seems too cramped for twelve men. The main cabin or saloon measures but 6 ft. 3 in. in height, 13½ ft. in length, 16 ft. in width at the lower, and 11 ft. at the upper end, while the six sleeping cabins off it are diminutive. In the deck-house are a small chart-room and Dr. Nansen's study, both small in proportion, and on the whole it gives one the idea of being a neat little doll's house for twelve gigantic puppets. The stove in the saloon consists of an iron case containing numerous copper tubes, and is heated by paraffine lamps. Lighting will be electric or by means of lamps. The dynamo is worked either by steam, wind or hand power. A large windmill will be erected on deck, where there is also a winch which can be worked by four or more men, and, in order to give the hands sufficient exercise during the darkness, the latter will be daily resorted to in the winter months. The caboose, or kitchen, contains an ordinary cooking range, and also a very compact and handy copper stove, heated by lamps, the gift of a London firm. The engines are triple expansion, and to obtain a speed of seven knots, consume three and a half tons of coal a day, of which she carries a supply of about 350 tons, calculated for 200 days' continuous steaming at about four to five knots speed. The furnaces are constructed to burn petroleum, or even blubber, and under petroleum the vessel obtained on a trial trip the same speed as with coal.

The provisions are of various kinds, quantities being especially prepared on scientific principles, to give the men's stomachs the least possible expansion with the greatest possible quantity of nutriment. Clothing is of many sorts, from woolen jerseys and underclothing to fur outer garments and waterproof British linen. The sledges differ considerably from those taken by Astrup for the Peary expedition, being much lighter, from 9 ft. to 10 ft. in length, 1½ ft. in breadth, and about 6 in. in height. They are said, however, to be wonderfully tough, and capable of bearing heavy loads, and most are shod with German silver to protect the wood. Numerous Norwegian "ski" are also taken. The Fram carries seven large boats, including a naphtha cutter, of the ordinary sealing or whaling type, and will be used for the chase of walrus and seals and other sporting purposes, while two will be specially fitted for escape should any accident happen to the Fram herself.

Last summer Dr. Nansen changed his plans, and announced his intention of proceeding, not via Behring straits, but round the Norwegian and Russian coasts, to the spot north of the Liakov islands which will be the starting point for the journey on the ice to the Pole. By adopting this latter route the sudden plunge into the glacial stream is avoided, but the chances of not reaching his destination at an early date are very considerably increased, as the ice in the Kara sea may be impassable, and but very little is known of its conditions on the Siberian coast.

Man in South America

There is no part of the world that offers a more curious subject of speculation as to its future than the continent of South America, as was well set forth in an address before the American Geographical Society by its president, Mr. Gardiner G. Hubbard, says *Science*.

That the Amazon river system alone drains a basin of fertile land basking under a climate of perpetual summer, greater in area than the whole of Europe, is an astounding fact in itself. The vast territory is practically uninhabited. Its aboriginal population is disappearing, or has disappeared, and the whites, who in sparse numbers take their place, scarcely pretend to come with the expectation of remaining. There are tracts as large as the whole of France of which we know less than of any equal area on the globe. Tribes of men are living there who are yet absolutely in the stone age, and who, even by barter or distant rumor, never heard of the European race or the use of metals.

The question up to which Mr. Hubbard leads his reader is second in importance to none in the anthropology—that of acclimation. Is it possible for the white race, when it shall be endowed with all the resources of art and science which it is soon to have in its grasp, successfully to fight against the terrible odds of a tropical climate? He quotes in his favor the words of the historian, Buckle, and the naturalist, Bates. He might have added others of weight, but it cannot be doubted that most of the medical observers who have devoted themselves to this vast inquiry lean to the opinion that never will the white race flourish under tropical skies.

Mountain Chains as Barriers.

Dr. J. Rignault, in a lecture before the Ethnographical section of the Geographical Society of Paris, has drawn attention to the "Influence of Mountain Chains on the Distribution of the Human Race." His original observations resulted from a visit to Darjeeling and the Terai, but his conclusions are drawn from a study of the whole of Europe and Asia. He states the following laws: (1) When a chain of mountains, such as the Alps or the Pyrenees, separates two nations, . . . one generally thinks that the crest, the watershed, divides two races, each inhabiting his respective slope up to the summit. Nothing of the kind, and one can say that the crest of a chain does not separate two races. In support of this statement, Regnault says: This error is due to the fact that the crest generally serves as a frontier between two States. (2) Ordinarily the race

of tbe country toward whicb the lesser slope inclines inhabits not only this slope, hut crosses the crest and inhabits the more rapidly sloping side down to the plain in which the slope is lost. It is the junction hetween the rapid slope and the plain where the contact of the two races is to he found. To the second law he adds two postulates: (*a*) The mountain chain must he higb and long, as the Alps and Pyrenees. (*b*) The law is modified hy considerations of time, geology, climate, etc. Dr. Regnault discusses in some detail the Alps, the Pyrenees, Erz-Gebirge, Caucasus, and the Himalaya.

Scientific Facts.

Sir John Luhbock, who once kept a queen hee for 15 years, declares that a test proved that the eggs were as fertile at that age as they were 12 years hefore.

Scientists say that if the hed of the Pacific ocean could he seen, it would disclose to view several mountains with truncated tops scattered over it. These mountains would be perfectly hare at their hase, and all around tbeir tops they would be covered with beautiful vegetation of coral polypl.

An English medical journal suggests that the action of electricity on lead water-pipes may sufficiently impregnate the water with lead to cause poisoning. Here is a chance for some experiments with a view to determining whether water is thus affected or not under the conditions named. If it is, it might result in cases of serious illness, the cause of whicb ordinarily would he difficult to determine.

It is reported tbat Prof. Hermann has succeeded in photographing the vowel sounds hy speaking them into a phonograph which reproduced tbem slowly. The vibrations were recorded hy a microtelephone, which had a small mirror in the vihrating drum. A ray of light reflected from the mirror recorded its vibrations—that is to say, the vibrations of the vowel sounds—on a traveling band of sensitized paper.

New Precious Metals.

Gold and silver are no longer the precious metals of the world, says an exchange. An ounce of silver is wortb about 75 cents, an ounce of gold as a rule $20. Palladium, which was discovered in 1803 hy Wollaston, is a metal of steel-gray color and fihrous structure, and is paid for at the rate of $28 per ounce. Osmium, a brittle metal usually found with platinum, cost $35 per ounce, and iridium $40. Ruthenium, which is very hard and brittle, hrings $82 per ounce, and niohium, also called columhium, first found in New London, Conn., is a very rare metal, discovered in an ore oxide, is rated at $100 per ounce. Yttrium, discovered by Woebler in 1828, is a metal of grayish-hlack color, with a perfectly metallic luster, which is very rare. It is paid for at the rate of $120 per ounce, while lithium, the ligbtest of all metals, brings $150 per ounce.

Glucinum or heryllium, as it is also called, appears in the form of a grayish-hlack powder, made very lustrous hy burnishing. It has a market value of $185 an ounce. Barium metal, which was discovered in 1808, is worth $200 an ounce, and didymium, discovered in 1846, and very rare indeed, hrings $215 an ounce.

Varnish from Linseed Oil.

A German bas taken out a patent for producing varnish from linseed oil by means of an electric current. The oll, after being purified in a proper manner, is thoroughly mixed and agitated with sulphuric acid and water, and subjected to the action of an electric current for two or tbree hours, so that the oxygen produced in the nascent state hy the passage of the current converts tbe oil into varnisb. The varnisb so produced is said to he almost colorless and perfectly free from all mineral or metallic admixtures or impurities.

—MANUFACTURERS OF—

Stationary and Compound Engines, Flour, Sugar, Saw and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

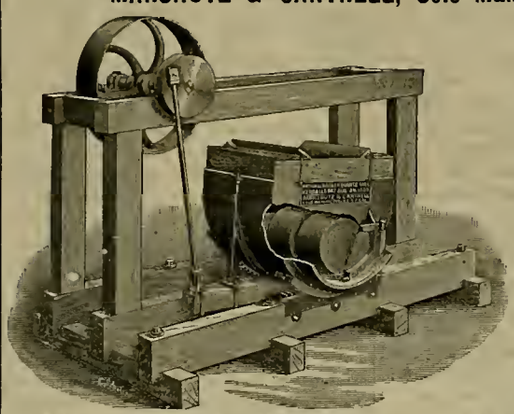
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamatiog ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the puhlic.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, hut can make any length or width desired. The advantages of these belts over *any others* will he readily seen hy practical millmen.

First, the flanges or edges of our helt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused hy the frequent hreaking of the flanges of the old style helt is practically done away with. Again, our helts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the helt, and prevents it from hanking on the sides and orming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a helt, the surface of which is entirely smooth. We can safely say that it is a hetter concentrator helt than has ever heen manufactured. It will last much longer and will handle more pulp. We also manufacture smooth helts with same flanges when desired.

Youngwood, Westmoreland County, Pa.
SPECIALTIES: Nickel, Tin, Dry Placer Development, Treatment of Refractory Ores, Electric Heating and Smelting.

EDMUND B. KIRBY,
Consulting Mining Engineer and Metallurgist
No. 9 Windsor Hotel Blk., DENVER, COLO.
SPECIALTY—The Expert Examination of Mining Investments and Metallurgical Enterprises.

O. A. OGDEN. W. N. JEHU.
JEHU & OGDEN,
Chemical Laboratory and Assay Office.
(Formerly Evans' Assay Office.)
628 MONTGOMERY ST., San Francisco
ROOMS 46 and 47 MONTGOMERY BLOCK.
Ore Assays, Analyses of Minerals, Waters, all Technical products, etc., made.
Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
723 MARKET ST., SAN FRANCISCO, CAL.
Open all year.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50.
ESTABLISHED 1864. ☞ Send for Circular.

Nevada Metallurgical Works,
NO. 23 STEVENSON STREET,
NEAR FIRST AND MARKET STS., SAN FRANCISCO.
C. A. LUCKHARDT, Manager.
ESTABLISHED 1869.
ORES WORKED BY ANY PROCESS.
ORES SAMPLED.
ASSAYING IN ALL ITS BRANCHES.
Assays of Ores, Minerals, Waters, Etc.
WORKING TESTS (PRACTICAL) MADE.
PLANS AND SPECIFICATIONS furnished for the most suitable process for working ores.
SPECIAL ATTENTION paid to examinations of mines: plans and reports furnished.

(Formerly Huhn & Luckhardt),
MINING ENGINEERS & METALLURGISTS.

JULIUS H. STRIEDINGER, M. Am. Soc. C. E. OTTO VON GELDERN, M. Am. Soc. C. E.
STRIEDINGER & VON GELDERN,
CIVIL AND MINING ENGINEERS, TECHNICAL EXPERTS, LICENSED SURVEYORS.
Hereby announce that they are prepared to make the Examinations, Surveys, Technical Drawings, Estimates and Reports required by the
CALIFORNIA DEBRIS COMMISSION,
Created by an Act of Congress, approved March 1, 1893, and to represent the petitioners before the Commission.
Address: 819 Market Street,
SAN FRANCISCO, CAL.

EVERETTE'S MINING OFFICE.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
Mining Law, Mine Examinations, Metallurgy.
ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES in any part of the world. Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will be honestly given.
DR. WILLIS E. EVERETTE, 1318 E. ST., Tacoma, State of Washington, U. S. A.

ACTUAL BUSINESS PRACTICE.
Established 1863 **PACIFIC Business College, 320 POST ST. SAN FRANCISCO.** Established 1863
LIFE SCHOLARSHIPS, $75.
Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON, Pres.

HEALD'S
BUSINESS COLLEGE.
24 POST STREET.....SAN FRANCISCO.
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. ☞ SEND FOR CIRCULAR. E. P. HEALD, Pres. C. S. HALEY, Sec.

Electricity.

The Magnetic Pole.

No one knows, and therefore no one can explain, the precise reason why a magnetized needle does point to that mysterious spot on the coast of Bothia Felix, and, strange as it may seem, there was in 1831 no visible trace of anything by which that spot could be recognized, not even so much as a small hillock in the immediate neighborhood, and the only means of proving that the magnetic pole had been reached was by the total inactivity of the compass at that spot, coupled with the almnst vertical position of the dlpping needle, says a writer in the *Cornhill Magazine*. On this most ioterestlog point the very words of Slr James Ross himself shall be given: "The amount of dip as iodicated by my dipping needle was 89° 59', being thus within one minute of the vertical; while the proximity at least of this pole, if not its actual existence where we stood, was further confirmed by the action, or rather by the total inaction, of the several horizontal needles then in my possession. These were suspended in the most delicate manner possible, but there was not one which showed the sllghtest effort to move from the posltion in which it was placed, a fact which even the most moderately informed of readers must now know to be one which proves the center of attractlon lies at a very small horizontal distance, lf at any."

A New Harbor Defender.

Captain McEvoy, of the Britlsh navy, proposes to put electricity to an ingenious use in naval warfare. He has invented the "hydrophone," whose office is to give warning of the approach of â hostile fleet in the darkness. The mechanlcal arrangement of the apparatus ls: An exceedlngly sensitive spring is arranged within a case, so adjusted that the slightest jar or vibratlon will cause it to move. Attached to the end of the spring is a piece of platinnm wire, which, acting in concert with the movements of the sprlng, will, when a current ls passed through it and a telephone receiver placed in the circuit, cause a distinct crackling sound to be heard in the receiver. The instrument for use is anchored several miles from shore and connected to the latter by electrlc circuit. The mere presence of an ncean-going steamship will create an intense crackling sound, and by an ingenious contrlvance will also set ln automatic motion an electric bell and an electric lamp. With such a protecting apparatus in successful operation it will be practically impossible to use torpedoes or to employ strategic means of approach with any degree of efficiency.

A Self-Reversible Trolley.

The following ingenious device for trolley cars is announced: "Mr. W. E. Hamllton, of the Shreveport, La., electric street railway, devised a plan by which the motorman of the car is not compelled to reverse the trolley pole when the car reaches the end of the line. The inventlon is a simple yet most effective one. It consists in raising the trolley wire at the terminus so that when the car stops the trolley pole is pulled into a perpendicular posltion by its springs. By this means, when the car starts back the pole is automatically reversed, and the motorman loses no time."

Storage Batteries.

A report on a set of storage batteries in a private installation, recently made by Prof. Weber of Zurich, shows that lt is possible, under proper conditions, to attain very favorable results, says the *Engineering Magazine*. He found the ampere-hour efficiency of the installation to be 96.5 per cent and the watt efficiency 82.4 per cent. He gives lt as his opinion, after a very extensive experience, that well-constructed, well-managed, and continually active storage batteries will yield on discharge from 92 to 97 per cent in ampere hours and 80 to 84 per cent ln watt hours. Other lnvestigators have discovered that it is of the highest importaoce to use both pure water and pure sulphuric acid, and that the slightest impurity has a very great effect on the efficiency of batteries. This ls a fact well known to many old telegraph men from their experience with primary batteries used in that service. The writer remembers an instance at Greensburg, Pennsylvania, in which he found it absolutely impossible to maintain a battery in working order which was made up wlth water taken from a creek in the neighborhood, although upon substituting rain-water, the difficulty vanished at once.

Electricity Cures Insomnia.

A typical case of insomnia is said to have been successfully treated by electricity. The form of the affectlon dealt with was that which usually accompanies neurasthenla or debility of the nerve centers. The patient at first showed great fear of the current. This dread is described as "the usual initial difficulty." The treatment conslsted of both local and general applications, mostly with continuons currents. The general treatment took the form of dipolar electric baths, commencing at 50 milliamperes for five minutes, and concluding with 150 milliamperes for 15 minutes. The local applications were made to the head in various ways with a current from two to five milliamperes for five minutes. The result was that the patient's sleep steadily improved till it reached an average of six hours out of the 24—" that is to say, that after seven weeks of treatment, consisting of about 30 seances and 12 baths, sleep was practically restored. Not only this, but the general health and moral condition were strikingly improved. Instead of dark forebodings and pessimistic views he talked cheerfully and hnpefully of going back to work agaln."

Vacuum Tubes Attract Each Other.

An interestlng experiment was shown at the recent soirees of the Royal Society by Sir D. Salomons and Mr. Pike, and these being continued ln the laboratory show that two vacuum tubes have a strong attraction for one another, whether they touch along their whole length or only at the ends—one of the tubes being of the shape of a dumb-bell, for lnstance. The experiments find that a spiral vacuum tube sucks in a "core" tube as a solenoid does an iron "core," and the more the "core" is drawn in the less luminous the "core" tube appears, the "core" tube not being connected to the circuit. When the tubes are placed end on they attract one another; nn repulsion takes place, which would occur if the effect were of a static nature.

Lamps in Queer Forms

A Western designer of advertising specialties has recently fonnd several ways to make use of the electric light, says the *Electrical Review*. In several Chicago saloons are incandescent lamps in the form of beer bottles of the ordlnary pint size, but of clear glass, with the brewer's label pasted on the outside. In clgar stores are cigar-shaped lamps with the names of cigar manufacturers on the labels encircling them. The grocery stores have lamps made ln imitatlon of cakes of soap, catsup bottles, etc.

Electric Engraving.

In the Electricity Building at the World's Fair, one of the most ingenious little devices exhibited is an electric engraving machine, and there is always a large crowd watchlng the process. The cutting point receives lts energy ln the form of rapid pulsations, and if the nperator is skillful in sketching he need only take this tool in his hand and gulde it accordlng to the design he wishes to engrave; and the work is done nearly as quickly as with a pencil. All sorts of souvenirs of the exhibition are engraved whlle the purchaser waits.

Success of an Electric Torpedo.

A London paper tells of a very interesting series of experiments with the Sims-Edison electric torpedo which have lately taken place under a special commisslon appointed by the French Minister of Marine. Three buoys were moored out at sea, at some distance from the Caraque Battery, and the electrical eogineer was requested to steer a torpedo rouod each buoy in succession, to test its electrical steeriog capacity. The sea beiog rough, a successful result was unlooked for; but, on the order being given to start, it was at once seen that the weapon was under complete control, the torpedo passing round each buoy in succession, stopplng, starting and returning to the point of departure at the wlll of the operator. The roughness of the sea appeared to have no effect upon it, the speed attained being 11 knots, and the cable paid out 1½ kiloms. Later, a special trial of speed was made, the sea being high, when two mlles were covered by the torpedo at the rate of 18½ miles an hour.

New Plan to Transmit Power.

An electric company at Portland, Or., has arranged a plant for transmitting power from the falls of the Willamette, 12 miles distant, upon a different plan from that usually adopted. Five 40-kilowatt transformers are connected in serles at the power station with a dynamo giving an electromotive force of 1150 volts, which is run at such a speed that the current goes to line with a voltage of 5000. At the sub-station in Portland, the voltage ls about 4000, and the current is taken off by four similar transformers, also arranged in series.

Useful Information.

Money of the World.

Actlng Director of the Mint Preston has prepared a table of the monetary systems of the world. The table shows that the aggregate stock of gold is $3,582,605,000; silver, $4,042,700,000; uncovered paper, $2,635,873,000.

Stock of gold possessed by different countries ls as follows: United States, $604,000,000; Great Brltain, $550,000,000; France, $800,000,000; Germany, $600,000,000; Russia, $250,000,000. The stock of silver is as follows: United States, $615,000,000; Great Britaln, $100,000,000; France, $700,000,000; Germany, $211,000,000; Russia, $60,000,000.

The stock of silver is divided as follows: United States, $538,000,000 full tender, and $77,000,000 limited tender; Great Britain, no silver full tender, $100,000,000 limited tender; France, $650,000,000 full tender, $50,000,000 limited tender; Germany, $103,000,000 full tender, and $108,000,000 limited tender; Russia, $22,000,000 full tender, and $38,000,000 limited tender.

The ratin prevailing in nearly all principal countries between gold and legal tender silver is 1 to 15½. The ratio between gold and limlted tender silver is as a rnle 1 to 14.38. The respective ratios in the United States are 1 to 15.98 and 1 to 14.95.

The varlous monetary systems as divided among countries: Gold and sllver—United States, France, Belgium, Italy, Switzerland, Greece, Spain, Netherlands, Turkey and Japan. Gold—United Kingdom, Germany, Portugal, Austria, Scandinavian Union, Australia, Egypt, Canada and Cuba. Silver—Russia, Mexico, Central and South America and India. Of the the uncovered money South America has $600,000,000; Russia, $500,000,000; United States, $412,000,000; Austria, $260,000,000; Italy, $163,000,000; Germany, $107,000,000; France, $81,000,000, and Great Britain, $60,000,000.

The per capita circulation of gold is: United States, $9.01; United Kingdom, $14 47; France, $20.52; Germany, $12.12; Russia, $2.21. Per capita of all classes of money is: France, $40.56; Cuba, $31; Netherlands, $28.88; Australia, $26.75; Belgium, $25.53; United States, $24.34; United Kingdom, $13.42, and Russia, $7.16.

Monkey Language.

Accordiog to a letter which Prof. Garner has written to his brother in regard to his experiments wlth the mookey laoguage, he has succeeded beyond his wildest hopes. He has written down nearly 200 monkey words, and considers there are only 20 or 30 more which have escaped him at present. "Achru" means sun, fire, warmth, etc.; "kukcha" means water, rain, cold, and apparently anythiog disagreeable; "gosku" means food, the act of eating. Prof. Garner travelled 120 miles northeast of Slerra Leone, and established hls battery with the phonograph and revolving mirror in a clump of banyans, in a forest region swarming with monkeys. "The glitter of the mirror soon attracted a host of chattering monkeys. I watched them for an hour, and then cautiously approached. They disappeared like magic when they saw me, all but one, a chimpanzee.

"When I got close to it I found that it took no notice of me, but stood as if transfixed, with widely-opened eyes and dilated pupils, gazing at the mirror. There was a slight tremulous motion in the limbs and a spasmodic twitching of the ears. I could hardly believe it—the animal was hypnotized. It was making a gutteral sound like 'achru.' When I subsequently listened to the phonogram I found that a similar sound was frequently recorded thereon, amid what was then to me an unintelligible jumble of monkey chatter. I put the monkey in a bamboo cage, and on examining it about an hour afterwards found it still under the hypnotic influence. I revived lt with a good strong sniff of ammonia, and held a llghted taper before its eyes. It was qulte tractable and said 'achru,' and a few more tests satisfied me that this word embodies the idea of heat, light, warmth and brightness. Other words followed, and it was wonderful to take note of his awakening intelligence."

Uses of Asbestos.

Asbestos is a mineral fiber of the hornblende variety. It derives its name from a Greek word which signifies "indestructible by fire." The ancients were familiar with its uses and the modes of obtaining it, yet, strange to say, alluded to it as a vegetable production. It was used at all their funeral rites, but partlcularly where cremation was practiced, the corpse being wrapped in an asbestos cloth to keep the ashes of the dead person from mingling with those of the wood or other combustibles used in incineration of the remains. The people of Egypt and many other countries of the ancients, especially the royal and wealthy classes, made towels, napklns, tablecloths, etc., of asbestos, and cleaned them by throwing them into the fire.

Utilization of Coal Dust.

The London *Times* gives an account of a process by which anthracite coal bricks are now being manufactured by the London Coal Brick Syndicate. The bricks are made of grains of anthracite dust, which are forced to cohere by means of a special cementing compound and of great pressure. The coal dust is mixed with the binding material ln the proportlon of 95 per cent of the former to 4 per cent of the latter. The compound is fed into a mlxer, where it meets a jet of steam, a stiff paste belng formed, which is delivered successively into a serles of molds

under a pressure of 25 cwt. As the mold-plate revolves, the charge in each mold is brought between two rams, which exert a pressure of two tons per square inch on each side of the charge, forming a very dense and homogeneous coal brick. The brick, still in the mold, passes on to the delivery ram and by it it is pushed out onto a table and is removed for the market. These coal bricks are said to make an excellent fuel, and to possess a very high efficiency for steam-raising purposes. The *Times* thinks that with such a fuel at the disposal of the public, there is room to hope for a reduction in the pollution of the atmosphere of towns.

Facts About the Fair City.

To-day, careful estimates place the population at 1,400,000, and the probability is that it is rather above than below that figure. The area within the city limits is 181 square miles. There is over $200,000,000 invested in manufacturing enterprises, producing annually upward of $550,000,000 worth of goods, and paying employes more than $100,000,000. The wholesale business of the city aggregates more than $500,000,000, and its commerce more than $1,500,000,000. Its meat products alone are valued at $135,000,000. The bank clearings are nearly $5,000,000,000 a year. Over $60,000,000 has been invested in public schools, whose maintenance costs from $5,000,000 to $6,000,000 a year. There are 800 private schools, 350 seminaries and academies, and four universities. The public library contains nearly 200,000 volumes, and has a circulation greater than that of any other in the United States. The other libraries of the city are estimated to contain over 3,000,000 volumes. There are over 900 daily and weekly papers and periodicals, and 700 literary organizations. There are about 600 churches. Over $300,000,000 has been expended in the construction of buildings since 1876, and the annual expenditure for this is between $45,000,000 and $55,000,000.—St. Nicholas.

An Adhesive Cement.

Equal proportions of gum tragacanth and tapioca are ground together and heated with water at about 70° Fah., after which there are added about 50 per cent of gum hog and an equal amount of starch, and the whole mixture heated at from 70° to 120° Fah., says the *Scientific American.* The cement thus produced is said to be superior to any hitherto known for the requirement of silk and cotton manufacturers, calico printers, hookbinders, hat and bootmakers, etc.

Population of Large Cities.

The large cities of the world, according to a recent publication, have the following inhabitants:

London (1891)	4,415,958
Paris (1891)	2,712,598
New York and Brooklyn (1890)	2,352,150
Berlin (1890)	1,763,543
Canton (1891)	1,600,000
Vienna (1890)	1,364 548

There are only 12 cities with over a million inhabitants, of which China rejoices in possessing four.

WORLD'S FAIR REDUCTION.

San Francisco Pioneer Screen Works
JOHN W. QUICK, Proprietor.

GREAT REDUCTION IN MINING SCREENS UNTIL the opening of the World's Fair. Perforated Sheet Metals, Steel, Russia Iron, Zinc, Copper, Brass, Etc.

MINING SCREENS A SPECIALTY.

221 & 223 First St., San Francisco.

INVENTORS, TAKE NOTICE!

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.C. BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION — JUST OUT.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING OCUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform Syetem of Mine Bell Signals to Be Ueed in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, eo as to witbetand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

PRACTICAL TREATISE ON HYDRAULIC MINING.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditchee, Flumes, Dams, Pipee, Flow of Water on Heavy Gradee, methods of mining shallow and deep placers, history and development of mines, recorde of gold washing, mechanical appliances, such as nozzles, hurdy-gurdye, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of mines' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Adamantine Shoes and Dies

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill supplies.

Stamp Cam.

QUARTZ SCREENS

A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

Coast Industrial Notes.

—The estimated outpnt of Pnget Sonnd canneries this year is 300,000 cases. This is a 20 per cent decrease from last year.

—Weavervllle. Trinity connty, has decided to be lighted by electricity, and has made a contract with the General Electric Company to snpply the plant.

—The annnal report of the Pnget Sonnd customs district for the fiscal year ended July 1st shows that the value of foreign exports was $5,255,966. The duties collected on imports were $1,622,058.

—Commander Lndlow of the Mohican estimates the prodnct of pelagic eealing at 60,000 sklns this year, which, together with the catch of the lessees of the eal islands, will reach the value of $1,000,000.

—The Pacific Bank of this city is eaid to have sold out its interest in the San Diego etreet railway to a company in San Francisco that bas been snccessfnlly experimenting with storage-battery electric cars.

—The Park branch of the San Mateo electric road must be finished by the end of November or the franchise will be forfeited. The snrveyors began work last week on the line and the graders have followed them.

—The Execntive Committee of the Midwinter Fair is abont to ask for bide for bnildings. The five great bnildings are to be fitted even to the emallest and apparently most insignificant detail for the uses of the exposition.

—The contract for lighting Berkeley has been awarded to the San Francisco Electrical Company. The Oakland Gas Light Company refused to bid, protesting that the requirement that the old city plant be nsed wonld be a needless waste.

—The canneries on the Fraser river closed for the season Aug. 31st. The pack is estimated at 471,000 cases, which beats the record. The biggest previous pack was made in 1889, when 303,875 caees were pnt np. The pack on the northern rivers is very light, and will not exceed 80,000 caees.

—The Southern Pacific Railroad Company hae commenced the work of building a long, high trestle in the Honcnt bottom, between the town of Honcnt and Oroville. In places the railroad track will be raieed as mnch as six feet. Dnring the floods of last winter the railroad track near Honcut was snhmerged.

—The Black Diamond Coal Company has sent a commnnication to the Coast Seamen's Union asking, in view of low freights and dnll business, that the union consent that wages of eeamen be rednced from $40 per month to $35. It ie reported that other ehip-owners who employ nnion men will make a eimilar reqnest for reduction.

—The Sonthern Pacific Railroad Company has a large force of men at work building an iron bridge over the south fork of the Ynba river, in Snmmit valley. There is also a large force of men engaged in getting out 10,000 corde of wood in Ynba valley. Quite a large force of men is engaged in ballasting the railroad track between Antelope and Ben Ali.

—The Union Pacific has pnt in effect a new tariff for towing on the Columbia river, which reduces ratee from $100 to $60 on each veeeel. The reduction ie greatest on large veseels, euch as are engaged in the grain-carrying trade. The improvements made at Portland for deepening the channel have eecured sufficient water for the largest clase of ships to come and go fully loaded.

—The California Conetruction Company hae begun work on the Yuba cut-off under charge of Engineer Rumble. A force of men and teame were put at work laet week, and a few days thereafter they expected to have 100 teams and about 150 men at work, and will keep that number employed for almoet three months. They expect to complete the contract within four months.

—Surveye of the British ehip Cedarbank, which arrived here from Anstralia Jnly 27th with her cargo of coal on fire, are completed. Temporary repaire will consist of docking the ehip, ecraping her inside and out, repainting, calking the decks and putting in a patch of ceiling 24x35 feet. Approximate figures on repairs to be made here and at home are $8000; damage to cargo ahout the same.

—The California Dairy Aseociation hae been organized to protect and promote the dairy industry. Directors—William Niles of Los Angeles, Jamee B. Burdell and George Mason of Marin county, A. P. Martin and William S. Pierce of Sonoma connty, William M. Russ of Hnmboldt, P. Toanazzini, San Lnis Obispo; R. H. Brown, San Mateo; T. Duffy, Del Norte; M. Lynn, Monterey. No capital stock.

—Railroad conetrnction began in San Luis Obispo Monday, and 100 men are bnsy bnilding a massive stone and iron bridge across San Lnis creek, near the Hotel Ramona. The work ie now completed to ths town and when the bridgee are finished the stone men will be laid off. Work in the tnnnels is still progressing rapidly, bnt grading has stopped to await the completion of the tnnnele.

—The Associated Wholesale Grocers of California have incorporated to promote goodfellowship among the members and for mutual benefit and protection in bneiness affaire. There is no capital etock. The directors for the first year are Hermann Bendel, William Haas, W. B. Wellman, William Cluff, S. I. Wormser, J. Levi Jr., Webster Jonee, all of San Francisco, and P. C. Drescher and C. A. Lurhs of Sacramento.

—The Southern Pacific ie not qnite through cutting down expenses. A new time-card ie in preparation which will make a material redndction to the passenger eervice on the Western division between Oakland and Stockton. It ie not finished, and the changee will not be fully decided on till it is. Several trains will probably be drawn off, bnt as the travel by way of Nilee is light and of a general local character the change will affect few people.

—The Champion lumber mills, eitnated in the Sierra Nevada range, 30 miles east of Red Bluff, and operated by the Sierra Lnmber Company, cloeed down laet Thursday. The eeason has been a ehort one, only lasting three monthe. The average eeason's cnt of these mills for a nnmber of years paet has been 12,000,000 feet of lumber. Thie eeason's cut falls far below that fignre, being abont 7,000,000 feet. The reaeon given by the company for cloeing is lack of ealee.

—A temporary restraining order granted by Judge Henehaw on Satnrday laet, which prevented the East Oakland electric line from crossing the tracks of the Highland Park and Frnitvale avenue road at East Twenty-first etreet, Oakland, was dissolved Tneeday by Jndge Henshaw. As a coneeqnence, the work of extending the East Oakland line will be continued immediately toward Twenty-third avenue and thne into the territory which is now eerved by the Highland Park road and the Twenty-third avenne branch of the Haywards line.

—The following is a liet of biddere for furniehing the plumbing and heating apparatus for the Sacramento Federal pnblic building, according to two epecifications: Samnel Pope, Chicago, $12,890 and $12,320; Robert Clark, Peoria, Ille., $11,390 and $9,775; Chafer & Becker, Cleveland, $11,896 and $10,858; Frank Lyman, Sacramento, $15,933 and $14,993; Chae. B. Crnse, Milwankee, $11,924 and $11,464; J. F. Dalton, Chicago, $12,428 and $11,897; John Leyon, Waehington, D. C., $11,834 and $8,889.35; George H. Tay & Co., San Francisco, $14,990 and $14,590.

—According to the report of the Commiesioner of Internal Revenue, the total prodnct of beet engar in the United States for the year 1892 was 57,200,000 pounds, which was produced on 24,793 acres. By Statee the output was as follows:

	Acres.	Pounds.
California	15,993	43,500,000
Nebraska	4,900	7,000,000
Kansas	3,953	1,800,000
Utah	3,500	6,000,000
Virginia	400	700,000

The increase of California over 1891 was greater than the increase of any other State, and the average yield an acre far greater.

—At 8 o'clock on the night of August 31st a lamp exploded in Welle, Fargo & Co.'e express office, eetting fire to the building and Honey's hotel, burning all the bneiness portion of Copperopolis. The list compriees: E. B. Moore's ealoon, Moore & Hunt'e butcher-ehop, M. Honey'e hotel, Wells, Fargo & Co.'e expree office, Honey's saloon, Qneeto'e hotel, Blanchard's ealoon, Marzo'e harness-ehop, W. H. Caee's etore and barber-ehop, F. Fontana'e ealoon and barher-ehop, Watson'e aaloon, Copperopolis hotel, Roherteon's lodging-house, Western Union telegraph office and the postoffice. The Knights of Pythias building and two other buildinge were deetroyed. The contents of Fontana'e brick etore were destroyed. The estimated loss ie $75,000, with an ineurance of $4000.

—From an article on the coal fields of weetern Washington, contributed to the Journal of the Illinois Mining Institute by T. B. Corey, superintendent of the Oregon Improvement Co., the following etatistics of mine outputs for 1892 are taken:

	Tons.
Jennings, Skagit county	4,749
Blue Canyon, Whatcom county	25,675
Gilman, King county	103,000
Newcastle	160,000
Cedar Mountain	13,000
Black Diamond	90,000
Franklin	75,000
Alta	14,000
Kangley	25,000
Denny	4,000
Carbonado, Pierce county	152,000
Wilkeson	91,000
South Prairie	40,000
Acme	3,000
Bucoda, Lewis county	10,000
Centralia	7,800
Castle Rock, Cowlitz county	750
Kelso	2,000
Total	850,965

—According to fignres compiled by the *Puget Sound Lumberman*, the Northern Pacific Railroad ehipped from Washington dnring the first eix monthe of this year 57,960,000 feet of lnmber and 606,540,000 ehingles, reqniring 8155 cars, 3866 of which were ueed for lnmber. Dnring the same period in 1892 that road shipped 47,460,000 feet of lnmber and 324,040,000 ehingles. The Great Northern, from estimates fnrnished the Seattle *Trade Register*, ehipped 6,500,000 feet of lnmber and 331,500,000 ehingles. There were 147,015,570 feet of lumber ehipped by water dnring the firet eix monthe of thie year. This would give a grand total of 211,475,570 feet of lumber and 938,040,000 shinglee. The *Lumberman* gives the following rail totals by months:

	Lumber.	Shingles.
January	8,355,000	44,940,000
February	4,620,000	58,940,000
March	12,450,000	113,680,000
April	11,325,000	110,780,000
May	11,830,000	160,440,000
June	9,810,000	114,520,000
Totals	58,390,000	603,300,000

This estimate does not include all the ehipments made by the Great Northern.

Mining Summary.

The following is mostly condensed from journals published in the Interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MINING NOTES.—Amador *Ledger*, Sept. 1: The Bnnker Hill is having pipe laid to the Mayflower ehaft, preparatory to pntting in hoisting worke at that point. . . The Alma Company will have their hoieting worke in operation by the firet of October. That will be as soon as it is necessary, on account of the preliminary einking being more profitable with a windlass. The Alma people broke gronnd Monday, and put a night shift on Tnesday. They are going to progress with their work as rapidly as poeeible, and will have machinery and pipee on the ground in a short time. . . Everything looke well at the Bay State mine. They are still drifting north. The water ie decreasing slowly at the 300-foot level. The laet aseesement hae all been paid in and the pnrchaee price of the mine, $10,000, hae been paid. . . W. S. Weymouth of Drytown and Profeseor Holbrook of Sacramento are pntting in a five-stamp mill near Indian Digginge, in El Dorado connty, where they own a very fine mining property. . . J. C. Bell of Forty-Nine Flat reports everything flonrishing in the finest poeeible manner at the Bell-Reale gravel claim. A. Reale was up a few daye ago and brought down eome eamples of gold which went about 15 cents to the pan. . . The new four-drill air compressor recently put in at the Irma is of the latest improved pattern, manufactured by the Ingereoll Company. It runs the four drille which are ueed in that mine with the greateet poesible economy of eteam and wood, and provee most eatisfactory to the company.

MINE BONDED.—*Record*, Sept. 1: P. Fagan has bonded hie quartz claim, near this place, to Stockton parties. . . Peter King and Joe Bernardie are einking a ehaft on a quartz ledge a short dietance up Sutter creek. They propose to keep digging away on the claim ae rapidly ae their means will permit.

DEEP MINING PAYS.—S. F. *Report*: The Grover mine is eituated between Drytown and Amador City. The depth of the mine ie 1100 feet, and up to within the laet 40 days the mine hae ecarcely paid, it having been close work to meet the expenees. It is different now. Within the last 40 daye the minere have cut into quartz that paye $20 per ton and the quartz ie plentifnl. The mine ie being pumped to the depth of 900 feet by electric power, and now the company will go to work and put in electricity as a motive power for its entire working. The minere and managers over there have come to the concluaion that the country has only been "ekimmed" and that deep mining is the thing that pays.

Butte.

THE HUALETON DISTRICT.—Oroville *Register*: The Hurleton mining district extends from near the South Fork, a distance of eeveral miles toward Bangor and Wyandotte. The elevation is from 1400 to 2000 feet, and the country appeare to be a network of veins or lodes of gold-bearing quartz. The most prominent of theee are the Pactolian and the Phœnix. Work is being pushed on the Phœnix, so far as development ie concerned, hut the mill has had to shut down again on account of the lack of water. The rock is good and the lode widens and becomes richer as it is descended npon. The Pactolian promises to become a valnable mine, bnt none of the rock is being crushed, as the owners have not erected a mill. W. J. Powell has lately discovered a lode that ehowa excellent ore. The ledge ie 18 inches wide on top, and gets wider as it is descended npon. George McNair has etrnck a good lode on the land of A. McNair, and though only a few daye' work bas been done, the rock indicates good ore. H. P. Stow, in his mine, has cleared the shaft of water and the rock looks well. The Frenchwoman's quartz ledge is small, bnt the ore is valnable. The Andrewe lode indicates first-class rock.

AT A LIVELY CAMP.—Forbestown Cor. Oroville *Mercury*, Aug. 29: Dnring the past few daye the mercury has gone up eeveral degrees, ranging from 84° to 90°, and we call it quite warm for Forbestown. Col. McLanghlin, accompanied by State Mineralogist Crawford of San Francisco, and the mining expert, Mr. Chadburn of San Francieco, also the Hon. C. C. Belding, came up from Oroville yesterday. Thie morning Messrs. H. P. Stow and W. D. Cox went with them to the river to aee the Carliele mine, also a mine owned by Mr. Cox. Mr. Fred Hall and Leonard Adame of Clipper Mills bronght two of their city friends down to look over the minee to-day, and Dr. York went with them to the Gold Bank and Golden Qneen. They were much pleased with the mines and the manner in which they are worked.

Calaveras.

THE LINDERAXA.—Calaverae *Chronicle*, Sept. 2: The Linderaxa mine is sitnated near the Mokelnmne river, about a mile and a half from thie place, and is owned by Lee Vandel and Thomas Tynan. This mine has been prospected off and on ever since its discovery eome five years ago, the Sandy Bar Gold Mining Co., of which E. H. Davison of this place ie euperintendent, having had a bond of the property for some time; bnt it remained for the owners, Mesere. Tynan and Vandel, to made fnrther developments and prove the exietence of a well-defined and paying lead. A tnnnel has been run on the lead for a distance of 200 feet, and 70 feet from the mouth of the tunnel a winze hae been snnk to a depth of 50 feet. There are also two croescuts run west from the winze, the first one having been etarted abont eight feet down from the top of the winze and was only rnn ten feet when the lead was strnck; the second crosscut was etarted in the winze at a depth of 30 feet, and, after being rnn west for a dietance of 35 feet, the ledge was again encountered, the laet level cntting the ledge at a depth of 100 feet. The ore in both levele hae been thoronghly proepected, and shows an average of $40 to the ton. The ledge in the main tunnel ie between six and eight feet wide. The mine ie eo eituated that it can be worked to advantage hy a system of tunnels. There is a good chance for a mill-eite, plenty of available timber close at hand, and water can be obtained from the Mokelumne and Campo Seco canal under a 400-foot preseure if desired.

A BIG YIELD. — The famons Utica quartz mine at Angels, Calaveras connty, owned by Alvinza Hayward, the Hobart estate and C. D. Lane, yielded last month $25,000 more than the owners expected. The cleanup was made Saturday, Sept. 2, when Colonel Hayward, James Croee, repreeenting the Hobart estate, and Mr. Lane were present, and the gold bricke were bronght down by Meseenger McConnell and two other shotgun gnards of Wells, Fargo & Co. Thie wae the biggest cleanup at the Utica, and it was expected to be large, as a rich chute had been worked recently. The Utica ie a eteady producer, giving the owners more than $100,000 every month, and rock ie in eight for seven years' more work for the 100 etamps now rnnning. The vein ie 50 feet wide, and is now being worked at a depth of 800 feet, where it ie growing better. The mine costs to run about $40,000 a month.

NEW MILL.—*Citizen*: R. Leonard informs us that he has ordered a five-stamp mill for his mine on Murray creek.

Mariposa.

NEW MACHINERY.—*Gazette*, Sept. 2: Mr. Wm. Johns, who has bonded the Ward mine, is bringing a large amount of machinery to place at hie mine, and teams are busy hauling lumber and timbere to him.

Nevada.

THE SPAINO HILL.—*Tidings*, Sept. 1: The Spring Hill mine, located north of the Idaho mine, and owned by James M. Lakenan of thie city, hae been bonded to E. B. Thomas, J. F. Cooper and others. Yesterday a cleanup of six loade of quartz, crushed at Gauthier'e mill, yielded $180, or $30 per load. The ore was taken from a depth of 30 feet, and is said to be identical in character with that of the Idaho. The company has 100 tone of ore now on the dump.

GOOD YIELD EXPECTED.—Grase Valley *Union*: Supt. Skewes of the Gold Flat mine eaye there is a ledge about two and a half feet in size at the mine, which showe free gold. Although the gold is very fine, it is expected that the next crushing from thie mine will yield very well.

MAY START AGAIN.—S. F. *Report*: For the paet 22 years the Stockton mine, located about four miles eouth of Grae Valley, has been idle. The ledge wae worked ahout 22 yeare ago by a company of men from Stockton, and they only snnk the ehaft down to 130 feet. There has been $60,000 in gold taken from the ledge during its activity. A gentleman from Colorado named J. Burrowe has charge of the property and is representing a company of men with ample meane, and they intend to thoronghly proepect the ledge. The work of cleaning out and repairing the shaft has been commenced, and a whim has been erected. The ledge is quite

small as far as the bottom of the shaft, but indications show that it will widen as depth is attained. There is abundauce of water-power.

STRUCK GRAVEL. — *Telegraph*, Sept. 4: The company consisting of James Vineyard, James Pollard, Wm. Morgan and a number of others are doing well with their gravel claim down on the Yuba river, below the Bourn ranch. For some time the company has been busy fixing up an apparatus whereby the water could bs handled and the gravel in the river bed reached. The gravel has been struck at the depth of about 10 feet and it is said to be very rich in gold. It is thought that tbey have only struck the top of the channel.

MINE LEASED.—*Union*: Messrs. Smith and Riley have leased the Shoefly mine, an extension of the Osborns Hill mine, to Sacramento parties for a period of one year, with the privilege of buying at the expiration of that time for $10,000. The claim is very favorably situated for the discovery of a good mine.

Placer.

NEW COMPANY.—Placer *Herald*, Sept. 2: One of the new mining companies is the Santa Fe. Its members are all Auburnites, viz.: Jas. Hill, J. W. Morgan, M. T. Barnett, Dan Kirby and Prof. Hszsn. They are working at Canada Hill and think they have something in sight. Thos. Monaghan of Rock Creek left last week in company with Mr. Hill with a load of tools, provisions, etc. The Black Canyon mine, near Westville, is making a good showing under the able supervision of Geo. West. The Hogsback, at Westville, still remains idle. The White boys, at Ophir, are now running a 300-foot level to tap the chute. In their last cleanup, about two weeks ago, they realized $3000. It is rumored that the St. Lawrence mine, at Ophir, will start up again in about a month. Work is going right along at the Thres Stars mine at Ophir, the property of the Denver Co. and B. F. Hartley. One mile of pips will be laid, giving over 600 feet fall to run the hoisting works and dynamo. Most of the lumber is on the ground for the buildings. A contract for two 50-foot shafts has been let to Chris Lindley for $12 a foot. Pike Bell has been hauling a lot of his rock from near Clipper Gap to Col. McCullough's mill at the Minerica, below Auburn. It will be crushed in about a month.

AT FOREST HILL.—*Republican:* The Forest Hill divide is enjoying a season of prosperity, and the future prospects were never better. The gold output now is something like $70,000 per month, and upward of 500 miners are employed. Mr. Anthony Clark has just effected a sale of 560 acres of mining ground to the Gray Eagle Mining Company, which will at once drive a tunnel on the property, which they hope to complete in about ten months. Mr. Clark ie also pushing a tunnel on some valuable mining ground.

EXTENDING THE DITCH. — *Sentinel*: Water is now running through the South Yuba ditch to Long ravine and from there down to Bear river, where it is again taken up by the Bear river ditch. In a year or two this ditch will be extended down by Colfax and thence to Clipper Gap.

Plumas.

AT GIBSONVILLE.—Plumas *National-Bulletin*: The Feather Fork Mining Co. is pushing work on Thistle Shaft and employing a large force of men. Much gravel is being extracted from the great mine. Some of this is being washed, but a part of it is stored, awaiting a better water supply for washing purposes. At Slate Creek, the enterprise recently embarked in is progressing very favorably. Of the large flume 2½ miles have been completed, leaving a half-mile yet to construct. It is of a very substantial nature, on a graded and solid foundation, the flume being five feet wide at the bottom and nearly four feet deep. Capt. Gourley considers it one of the best mining propositions in the State, likewise the property of Packer, Hendell, and others, situated immediately below it. For years Slate Creek has been the ground or sluiceway for numerous hydraulic mines in that vicinity, and it is confidently believed that the bed of the stream is rich in placer gold. A few days ago some of the gravel, 15 feet from bedrock, was worked as an experiment, and it paid two ounces to the man. The large flume will enable the company to work the entire bed of the stream. The Taber mine, lying immediately east of the Thistle Shaft property, is being opened up. A tunnel to open up the great channel of gravel is being pushed ahead, and it is believed that only a few hundred feet farther ahead the rich deposit will be found. That thie channel is rich in gold work at Thistle Shaft has demonstrated beyond any doubt whatever.

San Bernardino.

FIND OF ALUMINIUM.—A correspondent of the Los Angeles *Herald* eays there is a vast deposit of aluminium in San Beruardino county along the line of the Santa Fe road. It ie a soft shale, free from silica and other impurities, aud feels like soapstone to the touch. As electricity is necessary for the reduction of the clay in which aluminium is found, and that can be cheaply generated in this section, this find may prove to be worth millons of money.

Sierra.

GOON ROOK.—*Messenger*, Sept. 2: We were shown some fine rock that was recently taken out of the upper tunnel of the Wm. Tell mine, at Sierra City. In the lower tunnel some 50 or 75 feet is expected to briug them into the pay chute, which, if it is only one-third as rich as it is in the tunnel above, will prove a bonanza for the plucky owners. The stock is mostly owned by Sierra City people.

Shasta.

THE QUARTZ HILL.—*Free Press*: Tbe parties who some time ago bonded the Quartz Hill mine, owned by Harrison and others, have paid an additional sum on the property, and they are to pay $32,000 more. The company is a Polish one, and represented by a gentleman named Marinsky. * * * A ten-stamp mill and other machinery lies at the depot for the Gladstone mine. This machinsry was purcbased by Capt. Clark and moved from Soda Springs, Idaho, and will be added to the mill already in operation at the mine, giving the company a capacity of 20 stamps.

Ventura.

DEPOSIT OF MICA.—J. H. Robb & Co. have opened a deposit of mica in the Piru district, Ventura county, which promises to become very valuable. Mr. Robb discovered the ledge last April and bsgan work on it in June. The surface croppings were only about an inch wide, but at a depth of 8 or 10 feet the lsdge has widsned out so that sheets eight inches square are taken out, and the ledge is still widening. He has offers of $4 to $7 a pound for all the clear mica that will average four to eight inches in width, and apparently there is a large supply that will come up to these requirements.

NEVADA.

Washoe District.

ON THE COMSTOCK.—Tbe week ending Ssptember 2d was a favorable one for the Consolidated California & Virginia and Hals & Norcross mines. At the Consolidated California & Virginia they extracted from the openings 52 feet below the 1650 lsvel 425 tons of ore and shipped to the Morgan mill 346 tons. The average car-sample assay of this ore was $41.72 per ton, and the average battsry-sample assay was $37.56 per ton. Thsse were the highest weekly averages in a long time. The usual work is being done in the mine. A small amount of $20 ore is being taken from openings 52 feet above tbe 1500-foot level. The official letter from Hale & Norcross is the most encouraging received from that mine in several years, and mentions a new and important discovery of ore. The lstter reads as follows: "On the 900 level west crosscut 1 from south drift was advanced 8 feet; total length 70 feet; face in porphyry; have also been digging a drain in south drift the past week. 1300 levsl—Completed winze station during the week, and sunk ths winzs 8 feet. Tbe bottom of the winze is all in ore of very good quality; extracted from the winze 14 cars of ore; average assay value $38.80 per ton. The ore is widening and improving in quality as it is being sunk on." The Potosi mine continues to yield a large amount of ore. During the week there were extracted and sent to the mill 424 tons and 750 pounds of ore from the 1000 and 1180 levels. Milled during the week 992 tons and 300 pounds on hand. On hand at mill, 133 tone and 700 ponnds. Average battery assays, $21.58. Average car-sample assays, $22.05. Shipped to the United States Mint at Carson 393 pounds of crude bullion. The east crosscut on the 850 level is cutting quartz which gives low assays. It is likely an upraise will soon be etarted to follow some of the streaks. The management has strong hopes of the 650 and 750 levels of tbe mine to the eastward. The Savage mine continues to yield a small amount of good ore, which is also being milled. Some good ore is also being taken from the Yellow Jacket. In the Kentuck Con. the south drift from the joint east crosscut is iu 53 feet; face in low-grade ore. Have etarted an east crosscut from the end of said drift. Have extracted from the etopes in west ledge about 25 tons of ore per day, of the average value as per car eamples of $7.75 per ton. At the Occidental Con. they continue to extract from the west ledge, above the 400 level, from three to four tons of ore per day of the average assay value of $33 per ton, as per car samples. From the other Comstock mines there is little of interest.

East Walker District.

CRUSHING GOLD ORE.—Hawthorne *Bulletin*: The Gignoux quartz mill on East Walker river started upon the 26th inst. on gold ore from the Round Mountain mine, the property of Rae & Norton. Mr. Norton informs us that but five stamps will be dropped for the present; also that they have 200 tons of ore ready for crushing.

Silver City District.

SILVER CITY NOTES.—Dayton *Times:* A. M. Cromer and Jack Harris are taking some good ore out of the Pioneer tunnel. The Alhambra mine, of Silver City, etarted up last Monday. H. J. B. Scheel is superintendent of this mine. The Red Jacket company, of Silver City, has again resumed operations on their mine. They have two men on shift. The Umatilla mine owned by Henry Scheel, ie looking very well. He has recently refused $12,000 for the property. There is some talk of running a trestle from the Golden Eagle mine to the Dazet mill to convey ore to the mill from the mine. The south extension of the Buckeye, owned by Stock and Dunn, will create the next excitement in mining circles in Siver City. The Boston and Lester mine in Silver City is looking better than it has for a long time. They expect to have another working of ore eoon. Sam Cummings, who has eome ground leased from Fred Bierke, has a clean-up every two or three weeks from which he nets $200 or more. Jolese Lawson has purchased another quarter interest in the Last Chance mine. He now owns half of the property. The claim is near the Buckeye. Foote and eons are doing some work on the Badger mine. Considerable dead work will have to be done, but the prospect is good for a rich development. The Flora Temple mine, opened by Wilson & Blair, is looking well. A recent clean-up at the Dazet mill made the boys several hundred dollars richer. The Del Rey mine, in Devil's Gate district, this side of the Oest, leased by "Butch" Geyer, is showing up some very rich sulphuret ore, and "Butch" will have a big clean-up soon. Three different strikes have been made in the Combination tunnel. These strikes were all made in the Golden Eagle, owned by Keating, Zadig and La Crouts, and show very rich ore. The clean-up of 150 tons, or thereabouts, of Haywood ore, worked at Taylor's mill netted about $3500. The owners will shortly put on several mors msn, and do some extensive work. The Schesl and Foote litigation has been settled, Mr. Scheel gaining the strip of ground he desired, and there will soon be considerable work done on those mines and in that ueigbborhood. Lockermau and Collier, who have a lease of the Pedröli mine, below the Buckeye, in Devil's Gate district, have taken out some very rich ore, and had it sacked. The ore is very rich, some of it going $1000 per ton.

ALASKA.

AN ALASKAN MINE.—S. F. *Chronicle*, Sept. 3: H. Moose and a couple of other miners arrived yestsrday morning on the schooner Emma Claudina, Captain Nielson, seventesn days from Ugak, Alaska. The miners claim to have discovered a rich gold mine and are bound East to secure funds to develop it. The story told on the schooner is that a drunken prospector went into a camp nsar Ugak and bragged about a gold mine that he had found. He backed up his statement with the exhibition of several valuable specimens of ore. That very night a party set out for the claim, the location of which had been fully described, and jumped it. Men wsre left to hold it while those that came down secured capital to develop the mine.

ARIZONA.

NEW GOLD MINES.—Tucson *Enterprise*: Quite a local excitement has been stirred up by assays made from the mammoth iron-stained quartz ledges in the uorthern part of the Tucson mountains. These ledges are immense affairs, where the ore can be quarried out with very little expense. They ars but a very few miles from the Santa Cruz river aud about 14 miles from Tucson. Being so very extensive and displaying uo particular evidence of value, they have for many years remained undeveloped, being located from year to year. Quite recsntly B. C. Brichta had a little work done on a claim thsre, and at a depth of five feet took out ore that yields over $56 per ton in gold. On ths surface the rock goes from $4 to $8 per ton in gold, and of this ore tbere is enough in sight to keep many hundrede of stamps busy for years to come. No one knows to what depth the pay ore reaches, but from the apparent strength of the croppings and the increased value in depth, it is conjectured that the discoveries are very important ones. Already many locations have been made and some development work will shortly be done to determine the extent of the ore body.

WATER FOR MINES.—It is now proposed to pipe water from the canyons of the Santa Ritas to the Graterville gold fields. The work intended is, saye the Arizona *Citizen*, hydraulic mining. Everything is favorable for it. The water runs down a canyon of the Santa Ritas. This carries a stream six months a year of sufficient volume for mining of that kind. Between this etream and the gold fields is a hnge limestone divide. In one place a gap in it is only 250 feet higher than the gold fields. The gold fields propsr are, Mr. Hughes declares, the biggest placering proposition in America, and probably in the world. They have produced since their discovery, 19 years ago, about $2,000,000 in gold. Ever since they have been worked. At present 250 men are there working out the yellow dust and tiny nuggets with rockers in a very primitive fashion. On the flats there for thousands of acres the precioue dust is scattered.

OUTLOOK GOOD.—The outlook for the gold fields of tbe Superstition, says the Mesa *Free Press*, grows brighter. Three eight-hour shifts are now operating in the Mammoth taking out the glittering ore. The new town of Gold Field is growing steadily. A postoffice has been established and a echool district has been formed. The working ehaft of the Mammoth is now down 90 feet, and the ore body increases in extent, while its richness continues to be the wonder of the old miners. Work on the 20-stamp mill ie being pushed with all possible haste.

IN MOHAVE COUNTY.—Kingman *Miner*, Sept. 2: A good streak of ore has been founu in the bottom of the Occident mine, White Hills. Peter Caffrey is still at work on his new find near the Cincinnati mine, and is getting out rich ore. Joseph Morrow has sold a one-half interest in the Lucky Joe gold mine in Gold Basin to Frank Ferraris. The drift in the Nighthawk mine is now being driven in at a good rate. More men have been put on, and some good ore is being taken out. Frank O'Dea & Co. have leased the Prosperity mine, and will soon commence work thereon. The Prosperity is one of the best mines in the county. J. W. Gerritt has quit sinking on the Rural mine, at Mineral Park, and has etarted a crosscut to cut the vein from wall to wall. The drifts are showing up good ore. U. S. Jackson, S. W. Mix and Dick Cleve have located three claims iu Wallapai mountain and have named them the Grand Prize, Ward and Old Gray Eagle. The Grand Army mine at White Hills is now producing enough water to supply the hoisting plant with all it uses, besides furnishing all that is used in and around ths other mines. The person or persons who will put a concentrating plant below Cerbat will be rewarded by big returns on the investment. The gold ores in and around that camp are rich, and can be made to yield handsome returns. Tom Steen has been taking out considerable ore from the old Jennie mine, in Weaver district, whiçh he has had worked at the El Dorado Canyon mill. He has a splendid ahowing of ore in sight iu the mine, and will commence stoping as soon as the canyon mill starts up again. The Kingman Sampling Works will resume operations during the coming week. They will be ready to sample and purchase all kiuds of ore. John C. Potts came in from White Hills yesterday, and will remain in town with hie family several days. He informs us that the leasers on the Princs Albert mins have struck ore in new places, and that the mine is now looking better than for many months past. Stockton Hill, at one tims the best camp in northern Arizona, is now almost deserted. For years the miners on the Hill produced immense quantities of rich ore, and there are still vast quantities in the mines, but, being silver, they will uot now pay to work.

IDAHO.

WORK FOR MINERS.—A Spokane, Wash., dispatch of Sept. 1, says: The first beneficial movement resulting from the recent rise in the price of lead will be felt to-day in Burke, Idaho, when 200 men will be put to work on the Poorman mine, which will resume operations in full. The terms of the miners will bs met by the owners no compromiss having been effected. The men had been offered a sliding scale, which was rsfused. Supsrintsndent Clarke said to-night that the rise in lead made it possible to pay the wages demanded. The mine-owners at other points in Cœur d'Alens are still endeavoring to adjust a new scale, but it is rumored that the example of the Poorman will be followed pretty generally at an early date. It is gsnerally agreed that the outlook for a compromise is dubious and that if work is resumed it will be at tbe old terms, which include an arbitrary scale of $3.50 per day for all labor, skilled and unskilled, bsneath tbe surface.

SEVEN DEVILS COPPER.—Wsiser *Signal*: R. C. Eckes, tbe expert who represents the Salt Lake men who contemplate putting in the smelter at Seven Devils, arrived last week and went into the camp in company with Mr. Hoyt. Mr. Eckes was amazed at what he saw in the camp. He said: "For the last five months I have been chasing around after copper prospects, and in all the prospects I have examined during that five months tbere is not as mucb copper combined as thsre is in one location in ths Ssvsn Dsvils." He said that all tbe prospects he had examined in Utah, Wyoming and elsewhere would not supply enougb copper to keep ths Salt Laks refinery rnnning a month and that the compauy needed just sucb a source of supply as the Seven Devils, and would undoubtedly take hold right away. Mr. Eckes figured that on the Peacock, taking it from the road level without going down, there were 180,000 tons of ore. Producing 300 pounds to the ton this would yield 54,000,000 pounds of copper, which at ten cents would be worth $5,400,000. Tbis ie all in sight.

MONTANA.

ONE SILVER MILL RUNNING.—Butte *Inter-Mountain*, Sept. 1: The miuing industry is at a very low ebb in Butte. During the week the forces at some of tbe Anaconda mines have been curtailed. The usual forcee are at work at the Boston & Montana, Bntte & Boston and Heinze smelter. The Colorado company and the Butte reduction works are running light. The Moulton is the only silver mill in the district in operation. Superintendent Clark says about 15 men are working in the mine, but they are not producing enough to pay expenses. The mill is running almost entirely on custom ore. Many miners who had leases had to continue at work upon them regardlees of the price of silver, and they have been compelled to sell their ore for whatever it would bring. Mr. Clark saye he is handling about $20,000 worth of cnstom ore a month. The general feeling about town is not so depressed as it was a fortnight ago. There are a large number of people idle, and many have struck out for otber places. The resumption of work on the Anaconda railroad has had its good effect. This, together with a large force being put on the street improvement, has given employment to nearly 1000 men. During the week the Granite Mountain and Bimetallic companies closed down, throwing 200 men out of work. It is said the Hope company of Phillipsburg will resume very soon.

OREGON.

NEW 100-STAMP MILL.—Baker City *Democrat*: A big mining company has been incorporated at Tacoma, Wash., and the seat of operation will be within 45 miles of Baker City. The company has been styled the Bonanza Mining Company, and the capital stock is $10,000,000. The new company has located 220 acres of land on Big Eagle creek. There is an inexbaustible supply of ore, there being two mountain-sides of it. The quartz is decomposed, is easily handled, and can be operated on the broadest scale. The rock assays from $3 to $10 per ton, free gold, which is exceedingly good. It is stated that the company will put up a 100-stamp mill and will work the prospect on a broad scale. The directore are Henry Raymond of San Francisco, E. L. Lewie of Chicago, C. B. Asken of California, Stephen Ryder, W. F. Sargeant, John W. McKeehan of Tacoma, W. C. Bronson and L. Rice of Portland.

CLEANING UP.—Jacksonville *Times*, Sept. 1: The Sterling Mining Co. is engaged in cleaning up, and the prospects for a good yield are excellent. Ennis & Cameron of Galice creek have finished their season's work and made a satisfactory clean-up. Messrs. Noah & McCracken of Sam's valley are engaged in prospecting a quartz ledge, which promises well. A very rich discovery is reported from Sucker creek, Josephine county, near the big cave. Tbe quartz is said to be very rich in free gold. The Burleigh drill employed at the Asbland mine is doing good work and has progressed over 200 feet. The rock is becoming softer and more headway is being made. Hosmer, Anderson & Co. of Foot's creek district, who have finished cleaning up, were in Jacksonville one day last week. They realized several thousand dollars from their season's work. The *Times* was in error last week in stating that J. L. Wilder was putting together 2500 feet of hydraulic pipe for Simmons, Cameron & Co. in Waldo district. It is at Ennis & Cameron's mines in Galice creek district that he is doing the work.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 7, 1893.

The silver market shows little change. The effect of hostile legislatinn by Congress has already been largely discounted, and, if the repeal hill passes, and is signed, it is not likely that a further heavy decline of prices will result. Silver purchases for the past month (August) have been less than 3,000,000 ounces, indicating that the policy of the administration to do as it pleases relative to silver, regardless of law, is to be carried out.

The highest and lowest prices fnr silver in London and New York for August were:

	London.	New York.
Highest	34⅞d	75¾c
Lowest	32 11-16	70¼
Differences	2 3-16d	5¾c

In July the difference between the highest and lowest London prices was 2¾d and 6c in New York.

In July the London market npened at 37¾d and closed at 33⅛d. The highest price during that month was 34¾d. The New York market opened at 70c and closed at 69¾c, the highest being 75c.

Since January 1, 1893, the highest and lowest prices in each month have been as follows:

Months.	New York—Highest.	New York—Lowest.	London—Highest.	London—Lowest.
January	84c	82½c	38 9-16d	38⅛d
February	84¼	83¼	38⅛	38¼
March	83⅝	81⅞	38⅜	37 9-16
April	83¾	82⅛	38 5-16	37⅞
May	84⅛	82¼	38 9-16	37⅝
June	83¼	82	38¾	30½
July	75	69	34⅞	32½
August	75¾	70¼	34⅞	32 11-16
Extremes	84¼c	62c	38¾d	30¼d

The lnwest prices ever recorded were in June, 1893, the Londnn market touching 30⅛d nn the 30th and New York 62c nn the 29th.

The Metals.

Copper, lead and tio have all showo ao advancing tendency during the week. The improvemeot seems to have come largely from betterment of general financial cooditions.

The Coal Trade.

J. Steuart's Coal Circular for August contains the following review:

Notwithstaoding the quietoess which has characterized the coal trade during the past few months the deliveries have beeo free and show ao average increase for the month of August, as compared with the same month io the past three years, of about 35,000 toos.

The total deliveries for the past three months, when compared with corresponding months of last year, show an increase of about 70,000 tons.

The deliveries in port during August were as follows;

Tons—	1893.	1892.
Australlao	18,400	15,500
Great Britaln	23,100	3,000
Eastern	.....	600
British Columbla	37,700	25,200
Port of Seattle	12,200	15,600
Port of Tacoma	28,600	15,200
Other mines	1,800	5,900
Totals	121,800	85,000

Total deliveries during 1893, to date, 827,500 toos; 1892, 794,500; 1891, 856,020; 1890; 666,160.

Quicksilver Trade.

The receipts of quicksilver at this port io flasks have been as follows:

Mooths.	1893.	1892.
Jaouary	2,243	1,701
February	2,388	1,543
March	1,588	1,875
Aprll	1,623	1,901
May	2,511	1,598
Juoe	2,790	1,614
July	2,014	1,632
August	1,909	2,013
Eight mooths	17,066	13,877

Against 8985 for the first eight months of 1891, 8202 in 1890, and 10,488 io 1889.

Silver and the Metals.

NEW YORK, Sept. 7.—Following are the closing prices for the week:

	Silver io—Londoo.	N. Y.	Copper.	Lead.	Tin.
Thursday	34½	74	9 60	3 70	19 30
Friday	34	73¾	9 60	3 70	19 40
Saturday	33⅜	72¾	9 90	3 62	19 40
Monday	33⅞	72¾	....	....	.....
Tuesday	33⅞	73	9 65	3 70	19 50
Wednesday	33⅞	74	....	3 65	19 40

The Stock Market.

SAN FRANCISCO, Sept. 7, 1893.

The volume of business in the stock market continues very small. More favnrable reports from the Comstock have given a better tone to a few stocks, but it has not appreciably increased activity in speculation. The question of miners' wages is yet unsettled, and, it is claimed, is a serious factnr in depressing prices. It is said that officers' salaries have been reduced and that the next legitimate place to bring down expenses is miners' wages from $4 per day to the California level of $3.

The following companies report having had balances on hand September 1, 1893, with the expenses for August unpaid: Andes, $9703.41; Alta, $328.64, with $19,173.63 due from C. Derby, late treasurer of the company; Alpha Consnlidated, $4901.99; Bullinn, $15,837.68; Best & Belcher, $9908.07; Bodie Consolidated, $8722.66; Caledonia, $8507.27; Challenge Consolidated, $1086.24; Consnlidated Imperial, $1579.33; Consolidated New York, $1026.09; Consnlidated California and Virginia, $42,615.89 in cash and bullion of the assay value of $31,196.10, with further shipments to arrive; Crown Point, $1460.31; Exchequer, $880.68; Gould & Curry, $7097.21; Hale & Norcross, $1221.86; Independence, $41.55; Justice, $505.68; Lady Washington, $94.62, with $4577 due fmm C. Derby, late treasurer of the company; Mexican, $20,557.52; Mnno, $5037.36; Nevada Queen, $518; Navajo, $1702.05; Ophir, $2082.69; Occidental Con., $1348.18; Seg. Belcher, $1294.18; Sierra Nevada, $5263.17; Savage, $11,730.31; Silver Hill, $182.52; Standard Con., $24,917.86; Union Con., $7280.63.

The followlng mining cnmpanies report having an indehtedness September 1, 1893, with the expenses for August unpaid: Belcher, $13,853.91; Belle Isle, $292.05; Bulwer Con., $2777.47, with the company's mill about tn he started upon an accumulation nf good ore; Chollar, $4742.82; Cnmmonwealth, $26,431; Confidence, $2535.14; Del Monte, $25,086.60; Grand Prize, $767.45; Kentuck Cnn., $2753.98; Nnrth Belle Isle, $3888.97; Overman, $3388.81; Pntosi, $19,073.84; Silver King, $8057.97; Utah Cnn., $1142.45.

The Brunswick Coosolidated Mining Cnmpany of Grass Valley has levied ao assessment of two cents per share, delinqueot October 6th.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUGUST 15, 1893.

503,806.—GLOVE CABINET—A. Bever, Spokane, Wash.
503,807.—MEAT BROILER—F. M Blamyer, Olema, Cal.
503,567.—GALVANIC BATTERY—C. H. Brown, Portland, Or.
503,455.—SPRAYING DEVICE—J. J. Dugan, Salem, Or.
503,313.—EGG-CARRIER—T. S. Fitch, Alameda, Cal.
503,281.—SAW GAUGE—C. F. Fowler, St. Helen, Or.
503,477.—FAUCET—W. F. Harris, S. F.
503,484.—VENTILATOR—P. H. Jackson, S. F.
503,322.—FIRE ESCAPE—J. R. Jones, Fresno, Cal.
503,145.—CULTIVATOR—J. Killefer, Reolance, Cal.
503,426.—ELEVATOR SAFETY ATTACHMENT—C.B.Lahatt, S F.
503,488.—BRAID RACK—A. H. Marten, San Jose, Cal.
503,497.—STRAP ATTACHMENT—Robbine & Walrath, Sacramento, Cal.
503,331.—FENDER—J. P. Rowan, Los Angeles, Cal.
503,490.—SNAP BUCKLE—G. F. C. Schroter, Redding, Cal.
503,389.—TOY—J. Sheppman, S. F.
503,390.—ENGINE STARTER—Small & Noyee, Sacramento, Cal.
503,506.—LUBRICATOR—C. E. Traves, Los Angelee, Cal.
503,222—SEWING MACHINE ATTACHMENT—G. Tucker, Los Angelee, Cal.
503,513.—BICYCLE—H. S. Williams, Maderia, Cal.

NOTE.—Coples of U. S. and Foreign patents furnished by Dewey & Co. In the ehortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RAISIN TRAY TURNER.—M. B. Skaggs, Brentwood, Cal. No. 504,254. Dated Ang. 29, 1893. This invention shows an apparatus which is adapted to receive a large nnmber of trays of raisins or other fruits, and hold them so that they may he tnrned over and the opposite side exposed to the drying infinence of the sun, the amonnt of labor heing greatly redneed.

TRANSPORTING LOOS.—Wm. V. Allen, Chico, Cal. No. 504,191. Dated Ang. 29, 1893. This invention consists of a novel mechanism for transporting logs hetween distant points by means of an endless traveling rope, a clamp by which the logs are connected with the rope or disengaged therefrom, and skids or ways over which the logs are hauled.

AIR BRAKE.—Wm. H. Masterman, Oakland, Cal. No. 504,227. Dated Ang. 29, 1893. This invention consists of an attachment for air brakes which allows the anxiliary reservoir upon each car to he snpplied with air and the desired pressure maintained without releasing the air pressure in the brake cylinders, and it also allows a supply of air directly to the brake cylinder, to maintain or incrense the pressnre therein.

ENGINE GOVERNOR.—Geo. E. Dow, S. F., Cal. No. 504,205. Dated Aug. 29, 1893. This invention consists of single oppositely acting plnngers operated hy the engine to he governed, and acting throngh the medium of a liquid fulcrnm upon the engine valve.

OVEN.—Wm. H. Weister, S. F., Cal. No. 504,184. Dated Aug. 29, 1893. This invention consists of an oven adapted to he nsed in conjunction with oil and similar stoves, and in which improved means are employed for the distribution and regulation of the heat within and aronnd the oven.

SURGICAL SPLINT.—Reinold Hoppe, S. F., Cal. No. 504,218. Dated Aug. 29, 1893. The object of this invention is to provide in one simple instrument a splint which is universally adjustahle, so that it may be applied to fractured limhs, npon the hack in cases of cnrvature, and generally to support, straighten or strengthen injured or malformed parts.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ahlest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American contioent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 hy its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

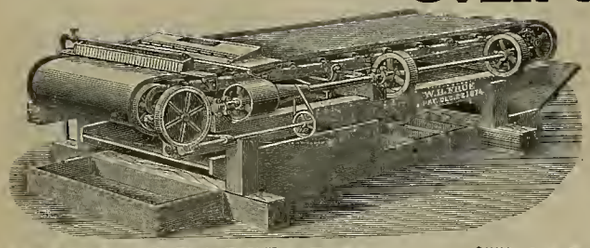
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small tomention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner.....$550, f. o. b.

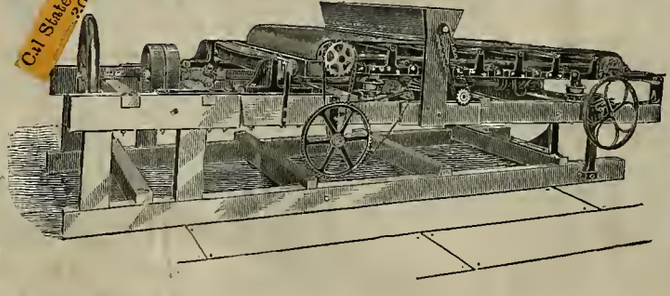
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

MR. THOS. MCGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works

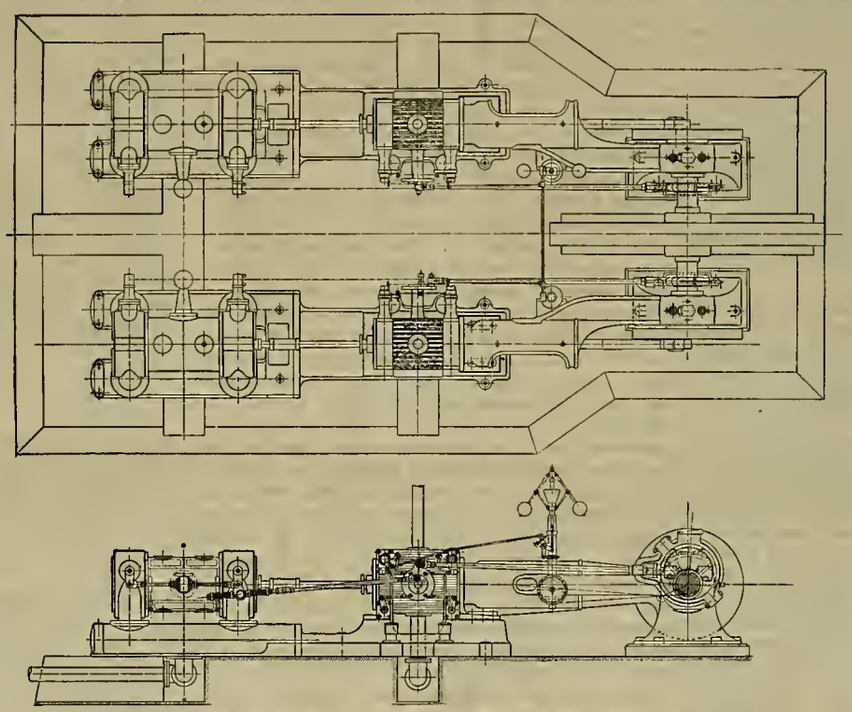
Riedler Air Compressor.

The accompanying illustration is the plan and elevation of the standard horizontal Riedler air compressor, as furnished for the Horn Silver Mining Co. of Utah. These may he employed as gas compressors, or blowing engines. The peculiar merits of the vertical system apply in the highest degree to the horizontal air compressors. In their circular describing this type of compressor, the manufacturers say: "Compressor cylinders are often connected with the steam cylinders by two rods, liable to spring and yield, a cheaper construction than that which is here employed, but liable to cause trouble and limit the speed of running. The compressor cylinder is here placed on a substantial bed-plate going through to the frame of the engine, and enabling us to utilize to the fullest extent the advantages of high speed peculiar to the Riedler system. Not only are the air cylinders provided with water jackets, but we avoid all trouble of heating at the stuffing boxes by also surrounding them with large water jackets. One suction and one delivery valve are placed on either side in the cylinder heads, and are easily accessible for any attention they may require. Clearance is reduced to a smaller percentage than with other systems, and occasions no loss of efficiency. We use our bed-plates as air pipes—a neat and economical arrangement—the main pipes and connections being well placed and accessible. A careful design of parts for the proper distribution of all stresses, ensures great durability in the machinery. Easy-running shafts, with large and well-fitted bearings, reduce expense for oil. Piston rods are unusually heavy, and wearing surfaces at the stuffing boxes are unusually large, to avoid wear upon the cylinders and pistons.



PLAN AND ELEVATION OF HORIZONTAL RIEDLER AIR COMPRESSOR.

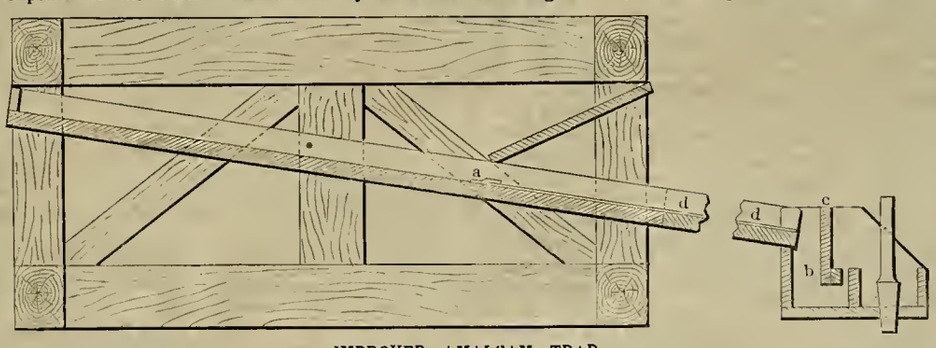
"Special valve details are used where gases are to be pumped, which tend to destroy ordinary valve seats. The Riedler system, with its large valve spaces and high lifts to the valves, is better adapted than any other for this class of service.

"Indicator cards of our Riedler air compressors, of either horizontal or vertical types, give practical proof of the theoretical advantages of the system, showing a higher percentage of useful work than obtainable with any other type of air compressor. The usual arrangement of our compressors, compounding cylinders, realizes the highest economy, and it is only for small sizes, or for blowing engines under special conditions of service, that we recommend twin or single simple air cylinders."

PROSPECTS are good that the Cœur d'Alene mines will resume operations within a month. Mr. Sweeney, one of the large owners, announces that, owing to the recent rise in lead, preparations are being made to begin work.

Improved Amalgam Trap.

On this page is shown an improved form of amalgam trap, to be used at the lower end of the amalgamating plate of the Dodge pulverizer, or any other crushing device. (a) represents a rubber strip tacked over the edge of the amalgamating plate; (d) the amalgamating plate; (b) the quicksilver or amalgam trap, and (c) is a sliding dash board. By this device the amalgam or quicksilver not caught on the plates is saved. The Parke & Lacy Co., of this city, are agents for the trap.



IMPROVED AMALGAM TRAP.

THE semi-annual statement of the Broken Hill Proprietary Company, Australia, published on another page, is of much significance, and will be of especial interest to silver miners of the United States in their time of trouble. The Proprietary Company's mine is now the greatest in the world. The Broken Hill mines are altogether the most marvelous silver deposit ever discovered, the Comstock lode alone excepted. Dsspite the low price of silvsr, the Proprietary mine is still worked at a profit, appearing to justify amply the claim of its owners that it is able to produce silver cheaper than any other mine.

First License to Mine.

The first license to mine by the hydraulic process under the Caminetti law was granted by the Debris Commissioners, last Saturday, to the Eureka Lake and Yuba Canal Company, at the Farrel mine, in Nevada county. It is announced that operations under the permit are to begin at once, monitors are in place, and water is ready to be turned on.

The action of the commission in response to the application of the Farrel mine-owners is of special significance and importance, outside the fact that the permit is the first issued in accordance with law and that the actual operation of new legal provisions is thus formally inaugurated. The Farrel mine was several years since enjoined by the courts and its owner fined for continuing to operate in defiance of the injunction. It had been idle during the interim, and the property, like hundreds of others estopped from work by the paralyzing clutch of the anti-debris agitation, was wholly valueless to its owners. When the hearing on the application to resume took place, last week, the attorney of the Anti-Debris Association was on hand, and entered a most vigorous protest, his main contention being that the debris of the mine had once been held by the courts to be detrimental to the Yuba river, and that conditions had not changed since the former lawsuits, the dam was inadequate, and the rivers were without sufficient protection. The representation was made by applicants, however, that the dam had been strenghtened and repaired, and that it was fully able to restrain debris to the extent of its capacity. Any valid objection which might exist to the working of the mine, on that score, therefore, was wholly removed.

It is evident that the commissioners completely coincide in this view. They have examined the mine and its equipment, and, as engineers, they consider themselves fully competent to decide whether the dam will restrain. By this decision they announce their line of action in several important respects: They propose to rely on their own judgment as to the capacity of restraining works to restrain. They intend to assist in the resumption of operations at mines closed down under the Sawyer decision wherever practicable and lawful. They will assist the hydraulic miner by every legitimate means, considering that it is the design of the Caminetti law to foster and encourage that industry without damage to other interests, and not to strengthen the hands of agitators and professional grangers in their crusade against the miner. It is their duty and their purpose to respect and protect all interests; but they have found that property of immense value yields no return under the decision, and they interpret the law to mean that this industry, as far as practicable, shall be restored to a measure of its former vigor and value.

FEW PEOPLE have an adequate idea of the number of Chinese engaged in placer and pocket mining in California. There are literally thousands of them, and they can be found in the hills and along the streams from the snow-capped Siskiyous to the sandy boundaries of San Diego. They are industrious, frugal, and generally capable miners, and the amount of gold they have taken out is enormous. Revenue Collector Quinn of San Francisco makes a very interesting calculation of the earnings of the Chinese of all classes, whose average population in this State for 30 years was 131,000. Most of them, he says, were employed in mining, and he thinks they have averaged 75 cents per day above expenses, in this and other pursuits. In 30 years their net earnings in all branches of industry reach the astounding sum of $810,000,000, much of which has come from the mines, and all of which the collector thinks went to China. The figures are probably an exaggeration, but they are interesting as showing the very important factor the Chinese have been in developing the mines and other industries of the State.

THE inventor of the new black-sand gold-extracting process, mentioned in this paper last week, turns out to be A. J. Hopper, who has made several surprising chemical and metallurgical discoveries in times past. Among other things ascertained by Mr. Hopper was a cheap method of extracting aluminum from common clay; but, unfortunately, his process acts upon the silicon in the clay in exactly the same manner as the aluminum, and an alloy is formed of the two metals which is brittle and unfit for the uses to which aluminum is applied in the arts, so that there is more or less question about the merits of Mr. Hopper's find. Inasmuch as his black-sand invention is guaranteed to extract $10 per ton from sand which assays $5, we also find some difficulty in the way of commending Mr. Hopper's other discovery to the favorable consideration of the investing public. On the whole, it will probably be some time before his inventions meet with unreserved public commendation.

IN his discussion of the silver question, Senator Teller of Colorado pointed out in a very plain and convincing manner that the Sherman law has not been responsible for the present crisis. The Senator cited the instances of the Northern Pacific Railroad, which recently collapsed with $250,000,000 indebtedness, and of other corporations whose stock was enormously watered, and which were tottering under the weight of their obligations. "Don't you think," asked the Colorado Senator, "that when a great corporation like the Northern Pacific collapses, and is left with a debt so great that its most enthusiastic friends cannot hope it can ever pay, finances in this country might be disturbed as well as in Europe?" This distnrbance does not come from the Sherman law. It comes from the misconduct of officials.

The Coming Miners' Convention.

A call has been issued for the annual convention of the State Miners' Association, to be held in this city October 9, 1893. In his address to the miners President Neff very fully states the purposes of the session, reviews various matters demanding attention, and points out the urgent necessity of vigorous and forceful action. There never was a time when it was more important for miners of the State to get together and consider subjects affecting their welfare. The industry has recently shaken off the lethargy with which it had been seized for a number of years, and, if properly encouraged, it is now in fair way to become the lusty and powerful giant it once was. The drift of legislation and judicial decision has of recent years been uniformly against the miner; but he has now the spirit and strength to stem the tide and to turn the current in his own direction. And the coming convention can do much to assist him in his effort.

One of the important things to be considered by the convention is the attitude of Congress toward hydraulic mining. The State of California has made a conditional appropriation of $250,000 for the construction of restraining dams at the mouths of unnavigable streams emptying into the Sacramento and San Joaquin systems; and it is desired to impress upon Congress the justice and necessity of making a sufficient additional appropriation ($500,000) to carry out the intent of the Caminetti act. That the inclination of Congress seems to be favorable is shown by the fact that a committee report at the last session was secured for an appropriation of $450,000, but, in its ardor for economy, the House struck the item out. The $250,000 State appropriation is an earnest of the faith and intentions of California in the matter, and it ought to be of great assistance in securing affirmative action by the coming Congress. The convention should present the matter to Congress in a proper manner.

The Stewart mining bill, which has been urged upon Congress at several sessions, and which, from a variety of causes, has failed to pass, is unfortunately still alive, and it is necessary for the miners to continue to urge their objections to several of its provisions. It threatens the welfare of the drift miners of California in a very serious manner, and it delegates to the Commissioner of the General Land Office unusnal and extraordinary powers in the adjudication of contests as to the mineral or agricultural character of land. It declares that the "testimony and proofs may be taken under such regulations and notice as the Commissioner of the General Land Office may decide." It is desirable to retain the present provisions of the law regarding notice and taking of testimony in contests. Under the proposed law the authority of the land department in determining contests would be practically limitless. The miners have no reason to be satisfied with the record of the land department in the past. The Stewart bill in this respect is a promise that its policy will, to say the least, not be different in future.

Altogether, the convention will be a notable and very important one. Representatives should be present from all the mining districts of California. Their time will be well spent.

Silver Still in the Senate.

The debate over the silver question in the United States Senate has occupied another week, but the senators have as yet shown little disposition to get down to the serious business of voting. Senator Voorhees, the champion of repeal, on Wednesday proposed that a vote be taken one week from to-day (Saturday) solemnly assuring the senators that his proposition was made "in the utmost good faith and respect for every senator and the Senate itself." In other words, the senator was simply rubbing a little oil on the gag before it was applied to the senatorial mouth. The silver men objected to the proposal and it went over. While the silver men have shown little disposition to filibuster, it is evidently their policy to get a full and free discussion of the matter. The longer the delay the better the chances of a compromise. The advocates of repeal are not strong enongh to apply cloture, and must wait until the debate has exhausted itself, or until the silver men are willing to bring the question to issue.

The latest compromise proposition comes from Senator Faulkner, of West Virginia. It is in the nature of an amendment to the Sherman repeal bill. It will provide for the monthly coinage of $3,000,000 of silver till the aggregate circulation of silver reaches $800,000,000, and will call for the retirement of all bills under $20 denomination. Faulkner says he has not yet canvassed the Senate upon the amendment, and is not prepared to say whether he can command sufficient votes for its acceptance. However, he has received many assurances of good will toward the principles suggested by the amendment from members who express their willingness to support the measure if satisfactory in detail. It is believed the great bulk of the silver advocates, Republicans and Democrats alike, will support the amendment if they find it impossible to get anything more favorable.

To Catch Unwary Investors.

Mining is a business which, conducted on correct principles, yields as safe and remunerative returns as any other business. Enterprises which honestly undertake the development of mineral properties are therefore entitled to the full credit and confidence of the public. But it is unfortunately true that the experience of many Eastern and other investors has been so disastrous that a certain amount of suspicion attaches to most new mining companies which invite outside capital to investment; and it must be admitted that careful scrutiny into such concerns is often both just and necessary.

Investigation will generally disclose their true nature. Cases are exceptional where it is found that mining enterprises have no merit, or, worse, are conceived in frand. Nevertheless, concerns with circus-poster promise and postage-stamp performance are not altogether a thing of the past, and probably they will not be until wickedness of all kinds is at a discount and the millenium has passed the three-quarter pole into the home-stretch.

The latest instance of the formation of one of these balloon concerns is "The Igo Consolidated Mining and Milling Company," incorporated under the laws of Illinois, with a capital stock of $2,000,000, declared to be fully paid up and non-assessable. The property of the Igo is by its gaudy prospectus said to consist of 11 mines and a five-acre mill site in South Fork mining district, Shasta county, California. N. Dunham, a resident of Igo, writes to the Shasta county *Democrat*, declaring that the mines "claimed by this company that are of any known value are owned and now being worked by other parties, and others of the claims are in litigation. In fact, the only mine of real merit claimed by this corporation was declared by a court of justice to belong to other parties 40 days before this incorporation existed, and the principal promoter and getter up of the company, W. W. Robinson, was fully aware of this fact when it was put into this incorporation." All these things, says Mr. Dunham, can be fully verified at Igo.

The prospectus of the Igo Consolidated Mining and Milling Company bears the evidence of false pretense on its face, in the claim that the capital stock of $2,000,000 (non-assessable) is fully paid up. It would be exceedingly difficult in these times to float any enterprise, however large, important and meritorious, by successfully enlisting that amount of cash capital.

IT is somewhat refreshing to find the Marysville *Democrat*, in a recent issue, urging the business men of that city to assist the people of the upper end of the county to open up mines and thus restore "to the natural channels of trade a considerable business which has been lost to Marysville through an unfortunate condition of affairs, the result of hydraulic mining." Doubtless the *Democrat* means that the trade has been lost by the cessation of hydraulic mining. No class of people, except the miners, have suffered more from the stoppage of hydraulic mining than the farmers themselves, and they have found it out through an object lesson that touches them in a very tender spot—the pocket. The local market for fruit and vegetable produce in the agricultural-mining regions has been paralyzed. The food supplies of the miners were largely secured from the farmers, who got good cash prices for them. This source of revenue has been almost wholly shut off, and, until mining is resumed, it will be felt more and more severely. It is true that the "boom" in fruit-culture for the past few years, and the profits obtainable in the East, have to some extent obscured the importance of a home market for these and other products. But the production of fruit is now so great that the business is down to a bread-and-butter basis, and much fruit must be sold at home or go to waste. The farmer wants the miner for a customer. He is learning that he must have him, and he is saying so, too.

THERE is a better feeling in the silver-producing districts than for some time, despite the probability of unfavorable legislation by Congress. Reports come from Montana that work will be resumed in the Anaconda copper mine, despite the extremely low price of copper—unequaled in the history of the metal. Two hundred and fifty men are to be put to work at once. Other mines are gradually increasing their forces. In the Cœur d'Alene, the recent rise of lead has encouraged mine-owners to announce that work will be resumed. The Bunker Hill & Snllivan mine still adheres to its proposal to put 250 men at work when they will accept $3 per day. In Colorado the rise in lead will doubtless also have a favorable effect.

Gold and Silver in 1893.

The very nearly complete cessation of silver-mining operations in the important districts of the United States, and the increased activity in the gold regions, offers a subject for interesting speculation to all who have followed the history of the two metals in recent years. In the past twenty years the silver production of the United States has increased steadily and with great rapidity—from $35,750,000 (coining value) in 1873 to $74,989,900 in 1892 The production of gold has shown a slight falling off, but in the past ten years its uniformity has been remarkable. The great development of silver properties, the opening of new and extensive fields, and the improvement of methods of reduction for a long time appeared to indicate that the limit of profitable production was yet very far in the future; but a variety of causes, some natural, others artificial, not necessary to recite here, broke down the market and reduced the price greatly below the average cost of mining and milling; so that for the first time in the history of the industry the swelling flood of its prosperity has been severely checked and the output enormously restricted. During 1892, the principal producing States contributed to the world's wealth of gold and silver the following:

	Gold.	Silver.
Alaska	$ 1,080,446	$ 10,030
Arizona	1,177,577	1,373,375
California	12,571,900	463,602
Colorado	5,589,021	31,478,972
Idaho	1,721,364	4 091,176
Montana	2,965,572	22,503,555
Nevada	1,571,500	2,901,200
New Mexico	959,176	1,390,856
Oregon	1,491,781	64,080
South Dakota	3,942,495	68,767
Utah	660,175	10.036,050
All Others	749,570	674.143
Totals	$31,431,577	$75,055,806

The output for the past ten years has been as follows:

	Gold.	Silver.
1883	$30,000,000	$46,200,000
1884	30,800,000	48,800,000
1885	31,800,000	51,600,000
1886	35,000,000	51,000,000
1887	33,000,000	53,350,000
1888	33,175,000	59,195,000
1889	32,800,000	64.646,000
1890	32,845 900	70,465.000
1891	33,175,000	75,417,000
1892	*33,000,000	74,989,900

*The actual production was reported by agents of the Mint to be $31,431,577, but the director of the Mint reduced the aggregate in his official estimate. The same discrepancy exists in the silver tables.

Obviously, it is not possible to make an accurate estimate of the relative production of the two metals for 1893; but, roughly speaking, it may be said that the gold output will be about the same, while silver will be cut down 50 per cent, more or less. The shutting down of silver mines has affected the incidental gold production, but in the gold States the increase will be nearly, if not quite, sufficient to compensate for the loss. The situation in the various States may be generally set down as follows:

In Arizona the incidental gold output is very small, and the total gold output for 1893 will doubtless show an increase. There will be a material falling off in silver.

The general activity of gold-mining in California, the resumption of work in old mines, the opening up of new, the repair of old works and the construction of new, will hardly be felt to their fullest extent until next year. But the gold output will nevertheless be increased several million dollars.

In Colorado the bulk of gold comes from Boulder, Gilpin and El Paso counties, which are almost exclusively gold producers. The incidental gold output (about $2,500,000), in connection with silver, will show a heavy falling off. Though there is great activity in the gold fields, the total production will hardly come up to 1892. It is impossible to make a satisfactory estimate of the probable silver yield. The falling off will be more than one-half.

Idaho will probably show a falling off in both gold and silver—very heavy of the latter.

There will be a very material decrease in Montana's production of both gold and silver—perhaps 50 per cent of both.

Nevada will show a decrease of both gold and silver.

In Utah the falling off of silver will be heavy, with a material decrease of gold.

Oregon will increase her gold output, and so, probably, will Alaska. New Mexico, South Dakota and others may be expected to show no great changes.

It is doubtless true that more than half the producing silver mines of the United States are now idle; but it is likewise true that many of them were operated in the early months of 1893, so that the falling off in the latter months will be heavier than in the former. If conditions remain to the end of the year as they are at present, the average output may be broadly estimated at from 50 to 60 per cent of the yield for 1892, or from $35,000,000 to $40,000,000, coinage value ($1,2929 per ounce). The actual value will be much less. The average value of silver for 1892 was .875 per ounce.

A COMPANY has been formed at Grass Valley to develop a part of country hitherto untouched. It is the Eastern Star Gold and Silver Mining Company, backed by local capital. The location is about 3½ miles east of the city, easily accessible by wagon. There are four ledges all of good size, in slate, and bearing good rock. The indications are so favorable that the opening up of a valuable property is confidently predicted.

Mining and Civilization.

Historical data in regard to the progress of mining and metallurgy are worthy of more attention than is usually accorded to them. Mining has been the great civilizer of the human race. The tribes of the early ages wandered about or lived in caves, subsisting mainly upon roots and nuts until they began to delve in the earth for its hidden treasures. From that time the human mind began to be enlightened, and man was gradually lifted out of his savage state into the early dawn of civilization. There was no progress so long as shells and other trifles constituted the only medium of exchange for commodities. It was only with mining, which led to the introduction of money, that progress was possible. That money is, and ever has been, the mother of all other agents of civilization and progress no one now disputes. But the miner had to be the forerunner of money. In his labors the miner has endured more hardships and dangerr, and toiled more severely for mankind than any other toiler.

When we look back over the world's history we find that special periods of intellectual and commercial activity tally closely with periods of special activity in the progress of mining and metallurgy. We find both in ancient and modern times there has existed a constant ratio between the elements of general progress in civilization and the amount and variety of mineral wealth drawn from the earth.

The commerce and power of the Phœnicians could never have been built up as it was had not the miner first dug the means for such development from the bowels of the earth. Their cities—Tyre and Sidon—accumulated their wealth and attained their magnificence mainly from the commerce which was built up by their traffic in gold, silver and tin—the latter then accounted a precious metal—which was exchanged with other nations for that which was needed in Phœnicia.

The Greeks also reached the height of their glory through the products of mines obtained, however, from their neighbors, the Phœnicians. Their efforts were mainly expended in working the metals, in which labor they excelled all others, as is sufficiently shown by Homer and other writers of antiquity.

Rome secured its superior ascendency from its control of nearly all the mines of the then known world. Spain furnished her with gold, silver, copper and iron, while Britain supplied her with tin from the mines first opened by the Phœnicians. Rome thus became the ruler of nations and the grand treasury of the wealth of the world; but, as much of that treasure was derived from the plunder of other nations, it was ill-gotten wealth, and finally became the millstone which dragged its possessor down to destruction.

The golden era of Egypt found its climax during the period of the most abundant development of her mineral resources. The treasures thus unearthed were devoted to the building of her wonderful cities and her still more wonderful and more enduring monuments.

The influx of the precious metals into Palestine through the commercial ventures of Solomon and Hiram of Tyre down the Red sea to the ancient Ophir, wherever that might have been, brought about the golden era of the Hebrew people.

The discovery of America and the consequent influx of the precious metals into western Europe, gave a new impulse to the nations of Europe, who were just awakening from the sleep of the dark ages.

It is within the memory of those now living, what a wonderful impulse was given to the industrial progress of the entire world by the almost simultaneous discovery of gold in California, Australia and South Africa.

LIEUTENANT C. C. GILLETTE, assigned by Secretary of War Lamont to duty in connection with the California Debris Commission, has arrived from the East, and his headquarters are established at room 92, Flood building, San Francisco. It is expected that Lieutenant Gillette will be practically the executive officer of the commission. Its members are Government officers who have many other things to do, and it is impossible for them to devote their whole time to their new work. The inspection of mines and of restraining works erected, or proposed to be erected, by an applicant for license to mine, will probably be made principally by Lieutenant Gillette, who is a competent engineer, thoroughly qualified by education and experience to perform that duty. His assignment to this field will materially expedite the work of the commission.

Tailings.

THE German mine at Washington, Nevada county, has been started up.

JACK ROSS is now superintendent of the Blackbird mine, Central District, Nevada.

IT is expected that the old Sneath & Clay mine at Nevada City will shortly start to work.

THE W. Y. O. D. mine at Grass Valley has declared its sixteenth dividend of ten cents per share, payable Sept. 15th.

THERE are said to be less than 500 miners employed in the State of Nevada, and 300 of them are employed at present on the Comstock.

THE Ganthier mill, at Grass Valley, after a long period of idleness, has again resumed the crushing of ore under the management of Thomas Kelleher.

THOMAS RHODES, a mining man, committed suicide at Los Angeles, Monday. Financial troubles are given as the cause. He once cleaned up $150,000 in Lower California.

REPRESENTATIVA MAGUIRE has presented in the House, at Washington, a monster petition from many parts of California in favor of free coinage of silver at the ratio of 16 to 1.

AFTER being shut down for a number of weeks the Brunswick mine, at Grass Valley, has started up. Superintendent Hawley, who has been in the East, will return soon and resume active charge.

THE Red Cloud mine, in Mariposa county, has been compelled to suspend operations. It lost a large sum of money by the failure of an Eastern bank. It is hoped and believed the suspension is only temporary.

THE Nevada City *Herald* learns that the Mayflower mine at Canada Hill had a clean-up last week which yielded its owners a dividend of several hundred dollars each. W. H. and Robert Martin, the foundrymen of Nevada City, are the principal owners. The Mayflower is a new mine.

ALVA GOULD, one of the earliest Comstock pioneers, and one after whom the Gould & Curry mine was named, was removed to the Washoe County Hospital, Nevada, last week, suffering from fever. He has made his living of late years peddling fruit at trains, and overland passengers will remember the kindly face of the decrepit old man with a basket of fruit on his arm ready to serve them.

THE Nevada *Transcript* of Sept. 13th says: "The Eureka Lake Water and Mining Company at Columbia Hill will commence hydraulicking to-day, and the five acres which they have been granted a license to work, by the Government Debris Commissioners, will yield enough of the precious metal to pay (if the company was so disposed) all the real damage done to the valley lands since 1850."

THE great decline in the market value of mining plants in Utah has caused the representatives of insurance companies to withdraw from the mining camps of that Territory, and, it is hinted, to curtail risks on mining property and in mining camps throughout the silver-producing region of the far West. The insurance companies are said to be refusing to renew policies, at least on former terms.

THE new owners of the Bonanza mines at Harqua Hala have filed articles of incorporation of the Harqua Hala Arizona Mining Company, under the laws of Minnesota, with its general office at St. Paul. The incorporators are: A. Wertenweiler of St. Paul, Minn.; Francis Muir, Sorrey, Eng., and Henry Bratnober of San Francisco, Cal. The capital stock is $10,000, divided into 100 shares of $100 each.

FORBESTOWN, Butte county, now consists of three hotels, three general merchandise stores, four saloons and a brewery, besides fruit and confectionery stores, barber-shops, a drug store and photograph galleries, meat market, and several other smaller concerns. There are three large quartz properties being worked which have a total of 80 stamps and two large reduction works. The hills are full of prospectors, and several more ledges are being opened.

SUPERINTENDENT DAGGETT of the Mint has made the following appointments: A. C. Cuneo of Stockton, workman in the coiners' department; Franklin Trippe of Santa Cruz, silver refiner in the melters' and refiners' department; Fred Taylor of San Francisco, corroding-houses in the melters' and refiners' department; Edward J. Murphy of Del Norte county, workman in the coiners' department; George Johnstone of Nevada county, janitor in the assayer's department.

THERE is some talk of the resumption of operations by the big North Bloomfield gravel mine, in Nevada county. This mine, before being suppressed by the courts, employed from 150 to 200 men, paying them from $2.50 to $3 per day. From 1875 to 1877 the mines of this company produced nearly $4,000,000, while from January, 1876, to January, 1884, during which time the mine was worked as an open hydraulic, the output amounted to $2,000,000. In January, 1884, the mine was enjoined in the suit of Woodruff *vs.* the North Bloomfield Mining Company *et al.*

H. SMITH, a stockholder, has brought suit against the Hale & Norcross Mining Company to enjoin the directors from selling his stock because of his failure to pay an assessment of 50 cents per share. He also asks that the assessment be declared invalid and set aside. The directors sued are: N. T. Messer, H. Zadig, John W. Turggs, George R. Wells, C. H. Fish, W. S. Lyle and W. Edwards. They are alleged to have levied the assessment sought to be set aside in pursuance of a conspiracy designed to injure the plaintiff and other stockholders. As a matter of fact, it is claimed that the mines of the association have been conducted at a profit. The income, however, is said to have been misappropriated by the defendant directors.

A SYSTAMATIC effort is now being made in Butte county to prepare a creditable mineral exhibit for the Midwinter Fair. A. Ekman, writing to the Oroville *Mercury* on the subject, says: "The materials needed to get up a magnificent show are, first, the good-will and co-operation of every miner in the county; second, suitable samples of gold quartz, gold-bearing sulphurets in quartz and all economic minerals, and, lastly, some money. When all the mine-owners and prospectors in Butte county will contribute a block of their choice quartz of not less than ten inches square, or cube when it is possible, and some interesting and valuable specimens of their own collection, a most imposing display could be gotten up."

Certain Dissimilar Ooourrences of Gold-Bearing Quartz.

The following are extracts from a paper read by T. A. Rickard before the Colorado Scientific Society, Sept. 4, 1893:

Coincidence of the Pitch of an Ore Shoot with the Intersection of Lode and Country.—No feature of vein mining offers more perplexing problems than the uncertain behavior of ore shoots. Occasionally the evidence obtained from underground surveys indicates the pitch in a particular direction of the successive ore bodies of a particular mioe, but the deductions which are then made may prove as dangerous and delusive as they often are practically useful.

In a little mine among the Australian Alps there was afforded me a very strikiog illustration of the dependence of ore deposition upon the geological structure of the country rock. At the Shouldn't Wouder mioe, seven miles from Bright, Victoria, the country rock is of Upper Silurian age and consists of altered slates and sandstones having a vary-dip to the west and a strike 35° to 50° west of north. Tbough these rocks show the changes due to metamorphic action aod exhibit a well-developed cleavage, yet the bedding has not been obliterated. The lode of the mine is a quartz vein having a strike 28° southwest of north and a dip to the northeast of 75° to 78°. The width of the lode is 15 to 24 inches and consists of simple gold quartz containing a very small but varying percentage of pyrite. Occasional faults occur; these are called "heads" by the miners and have a throw to the left. The break which they cause is clean, and there is no difficulty in again picking up tbe lode beyond the fault.

The plane of the lode cuts across the bedding of the country rock, and the vein is therefore what is commonly called a "true fissure." The examination of the foot-wall shows that the bedding planes are marked by lines having a dip 42° south. While the foot-wall is more regular than the hanging, and indicates this feature best, yet the face of the latter carries lioes which correspood to those occurring on the opposite wall.

Tbe country has a dip 79° southwest and a strike 55° west of north. The line of intersection formed by the crossing of the planes of stratification and the lode fissure was found to make an angle of 42° south, as indicated by the foot-wall. Upon referring to the longitudinal section of the underground workings, it was found that this angle coincided wlth the pitch of the ore bodies as worked in the four successive levels of the mine.

At the Myrtle mine, a few miles farther south, there was the same corelation between the pitch of the ore bodies and the line of intersection of the wall of the lode with the bedding planes of the enclosing country. The stratification was distinct, the rocks consisting of altered, often very sillcious, slates of a gray to a gray-blue color. At the 700-foot level the couotry had a dip of 80° southwest aod a strike 46° west of north, while the vein dipped 70° northeast and had a strike 20° west of north. The quartz vein was 2½ to 3 feet wide. In the stopes above this level the pay ore was separated from the valueless qnartz by a small step due to the irregular fracture of two beds of slate of unequal hardness. The miners had considered this a small fault. It marked the lioe of intersection between lode plane and and country bedding.

This particular ore shoot was 85 feet long and of variable gold contents. The quartz contaioed a large proportion of included fragments of country rock, giving the ore a mottled appearance. The gold was fine, often forming a gilded mosaic upon the faces of the fractures.

In the different parts of the miue the changing dip of the country produced variatioos in the angle of the liues of intersectiou, which varied from 35° to 55° south. The general pitch of the ore hodies of the mine, as worked to a depth of 700 feet, was found to be 45° south.

* * * * *

Occurrenie of a Rich Pocket of Gold Ore at the Crossing of a Fault Plane.—The pockets or extremely rich patches of gold-bearing quartz which are found in certain lodes of the maio Californian gold belt, more particularly in Calaveras and Tuolumne counties, offer many points of interest. The gold is often so little intermixed with quartz as to resemble a nugget, differing, of course, from the latter in the absence of water-worn edges and by its more filiform, spongy structure. It was long supposed that no gold had been found in quartz reefs in pieces such as would explain the derivation of the larger nuggets by the degradation of pre-existing quartz lodes. In these pocket mines, nevertheless, there have been found occurrences of gold quite able to account for the largest nuggets which have yet been found in California. It must not be understood, however, that in making this statement of fact I would wish to uphold the origin of nuggets as due to purely mechanical agencies.

At the Rathgeb mine, near Sao Andreas, there was found one of these pockets. It may be premised that the maio lode of this mine has ao augite schist (a very beautiful rock io which the augite is porphyritically dissemioated) on the foot-wall, and a more compact and massive rock, approaching a diabase, on the hanging.

Tbe zone of oxidatioo has a depth of about 160 feet; below this the lode is large and poor, consisting of white massive quartz, but above the water level the vein is replaced by a oetwork of quartz seams of varying sizes. Those having a regular strike to the northwest represeot the main lode, while the smaller, more irregular cross veins may be considered as feeders. Where these veins intersect there have been found bunches of rich quartz containing gold io a coarse form. I will describe the mode of occurrence of the ricbest pocket which was fouod duriog my stay at the mioe.

At the 120-foot level (south) and about 150 feet from the shaft there were some old workings, and upon an examination of these there was noticed a small cross vein one-sixteenth of an inch thick, the red clay filling of which showed a great deal of free fine gold when washed in a pan. A miner, experienced in pocket hunting, was put to wnrk at this place. The small streak, while it was generally very "slim" in size, yet occasionally opened out into small lenticular openings, yielding a clay in which the gold was as the raisins in a pudding, though also mixed with quartz, some merely fragmentary. Each pocket yielded gold worth from one tn five hundred dollars. At length this cross vein widened to 6 or 8 inches and looked like an ordinary quartz lode of more than ordinary richness, but not up to pocket standard. The amount of red clay began to increase, it became daily more gold-bearing, and a rich discovery was hourly expected. It was duly found. The vein became faulted, and at the place of the fault there was a soft, spongy, wiry mass of gold and clay—more gold than clay. The first handful which I broke while yet the stope was obscure with powder smoke contained three ounces of gold. Within the next two hours that pocket gave us $3000 worth of gold, and in the days that followed it yielded over $20,000, obtained at an expense of less than $200. When it had been worked out it was easy to study its mode of occurrence. The veio had been faulted about its own width, namely, 10 inches, and along the recess so formed the nest of golden material was found. A few feet overhead the vein met with another cross vein which bounded its extent in that direction, while below it narrowed to the width of a knife blade.

The gold was spongy and accompanied hy a certain amount of quartz which filled the interspaces. The clay which covered the gold aod quartz was partly red ochreous material and partly a gray, gelatinous, silicious matter. The gold, when washed, sold for $18 per ounce. The quartz associated with it carried pitch blende (uraninite) in needle-shaped crystals, which, immediately adjacent to the gold, became yellow uranium ochre. The association of gold and uranium is uncommon.

* * * * *

In presenting the foregoing brief notes descriptive of certain ore occurrences in the gold-bearing veins of mining districts so widely separated, the writer has not aimed sn much to call attention to any new economic features in this special class of ore deposits, as to afford evidence nf the fact of the great variety of modes of occurrence of gold-bearing quartz, and to emphasize the consequent danger of attempting to take a theory applicable to one district and of applying it to another region far distant and of entirely dissimilar geological structure.

Foundry Notes.

THE Reno (Nev.) fonndry has made a cssting weigbing tbree tons, which the *Journal* says is "by far tbe largest ever made in Reoo."

IT is uuderstood that a cbain for tbe constrnction of a marine railway at Esquimalt, B. C., has been ordered at a Liverpool foundry.

THE Fulton Iron Works have just received a large order from the Western Sugar Refinery for coudeosers for their sogar paos and other appliances used at tbe refinery. Work is to begin at once.

REPRESENTATIVE CAMINETTI has iotrodoced in the Hoose, at Wasbington, a bill to provide for the establisbment of a gnn factory for finisbing and assembling of heavy ordnance at Benicia, at the cost of $1,000,000.

A NUMBER of Froe vanners have been recently porchased and placed in position io the mill at tbe Shakespeare mine, Forbestown, Butte coonty. Tbe mill has just heen enlarged from 10 stamps to 30, making 12 the nnmber of Frue vanners in use. Col. Hayward is now working the mill at its full capacity, and is taking a great deal of ore from the mine. A oovel feature of the Shakespeare mill is that the ore is worked both hy concentrators and by the Plattoer cblorination process. The ore is rebellious, and after croshiog aboot one-fonrth the total—the best in quality—is chlorinated and the remaiuder goes to the concentrators. The chlorination plant is ooe of the most complete in California. E. L. Montgomery is snperioteodent.

THE loug-delayed plate for the tnrrets of the Monterey and tbe armor plates for the great warship Oregon have commenced to arrive, the Union Iron Works Wednesday receiving the first two cars, contaioing one plate for each vessel. The torret armor for the Monterey is a stupendous piece of metal, elliptical in sbape, seven inches thick and about four feet wide. It weigbs ahout 24,000 poonds and was bronght on a specially-constrocted car of giant streogtb. It is expected that all of the plates needed to complete the Monterey and tbe Oregon will be received without further delay, and advices have been forwarded of further and continued shipment. The receipt of the armor plates for the Oregon insures an early lannch of that vessel, and the arrival of the tnrret armor for the Monterey indicates that the Government has determined to let tbe Union Iron Works complete that vessel, instead of permitting the work to be done at Mare Island, as thooght probable. The delay in the receipt of these loug-expected plates was cansed by the great Homestead strike, and the completion of botb vessels was greatly retarded thereby.

THE first of a notable shipment of steel rope for cable railways was started Esst on Wednesday by the California Wire Works. It was in partial fulfillmeot of an order placed with tbe wire works for the mannfactnre of 14 ropes, and the 13 others are to follow as soon as ready. Tbe initial cable is 21,000 feet long, 1¼ inch in diameter and weighs 55,000 ponnds; with the reel on wbich it is wonnd over 60,000. It was hauled from the works to the depot by 50 horses. The placing of this order in San Francisco is a high testimonial to the snperiority of the California Wire Works' steel cables. The St. Lonis cable railways made a thorongh investigation into the merits of the cables made by the local factory, with the resnlt that they ordered a snfficient snpply for two years. The cable roads of this city have had experience with cables made by varioos manofacturers, hot they all state that cables made here have dooe hetter service than any other maker. Tbe wonder is, in view of this fact, tbat any cables are ordered from the East or Europe. Chicago and other Eastern cities are negotiating with the California Wire Works for railway cables.

Annual Convention of California Miners' Assooiation.

TO THE EDITOR:—On Monday, the ninth day of October, at 10 o'clock, A. M., in Pioneer hall, Fourth street, near Market, in this city, will be held the Annual Convention of the California Miners' Association.

Tbe miners of California are to-day in a better position than they have been for many years. Public sentiment is favorable to their interest, and gold mines are in demand. There is a desire to see the hydraulic mining industry become again productive, and to see the quartz "prospects" developed into mines. Everybody wants gold, and we have more of it in California than any other State in the Union. All that is now necessary is capital to develop our properties.

The last convention of the miners of California indorsed a bill, then pending in Congress, which was subsequently amended and became a law, with some unsatisfactory features. However, it is found from the proceedings before the California Debris Commission that some of the hydraulic mines can resume operations under this law. The State of Callfornia has already appropriated $250,000 to construct dams to restrain the debris in the rivers, contingent upon the Government giving a like amount. It should be our endeavor to impress this upon Congress, as with these sums devoted to said purpose, the gold yield from these mines would be greatly increased.

The people of the State of California begin tn understand that a grave mistake was made when the hydraulic mining industry was stopped. They have felt the effect of the decline in gold production very seriously, and will be glad to see the yield again increased. The opportunity is before us to show by our numerical strength that we are in earnest in our effort to double the gnld yield of this State. So productive an industry merits recognition and will receive it when the conditions are properly understood.

For several cnnsecutive sessions a measure has been introduced in Congress, but never passed, which merits the attention of miners. It is known as the Stewart Mining Bill, and seeks to amend the present laws in several important particulars. Should this bill be again introduced, as appears probable, there are several features which should be carefully considered hy the working miners of this State. The quantity of drift-mining ground patentable, under its provisions, is so small that it would not pay to run the long bedrock tunnels necessary to open the claims. The passage of this bill would be a serious blow to the drift miners of tbis State. It also seriously affects those prospecting for petroleum in California. The originator of this measure should have his attention called to the objectionable points.

Another matter which has never received attention at the hands of the California Miners' Association ls the perversion of the mining laws by the "rulings," so called, of the Interior Department. In some instances the law is practically nullified, and it is much more difficult for a miner to obtain title to mineral ground than its original laws intended.

The attention of Congress should be called to these unfavorable features of Department Rulings through which the prerogatives of Coogress are being usurped.

It is to be hoped that there will be a full attendaoce of delegates from the county organizations, at the couvention in San Francisco. Delegates are urged, if they have any measures to present, to bave them prepared in writing, in order that they may be promptly considered.

County organizations are reminded that funds are necessary to continue the work so well commenced, and should endeavor to assist the State Association as far as possible in this respect. J. H. NEFF, Pres.

Headquarters, Room 2, Ninth Floor, Mills Building.

Mr. W. C. Ralston, secretary of the State Miners' Association, states that the prospect now is that the attendance at the convention will be quite as large, if not larger, than at any previous session. Miners everywhere are manifestiog great interest in the convention and they realize fully that it is important for them to take some definite action looking to their welfare. "The purposes of the convention are clearly set forth in the call," said Mr. Ralston to a representative of the PRESS. "The three vital things which the miners must consider and act upon are the Stewart Mining bill, the rulings of the Interior Department, and hydraulic mining. Either of the three affects the future of the miner in a very serious manner; and all together make it necessary for concerted and decisive action to be taken. I have received advices that various mining counties are preparing to send delegations to the convention, and I think it safe to expect that Pioneer hall will be crowded to its utmost capacity."

THE house (Wilson) bill for repeal of the purchase clause of the Sherman law is now under consideration by the Senate. It is expected that when a vote is reached, the Voorhees bill, with substantially the same provisions, but declaring also for bimetallism, will be substituted.

The Broken Hill Silver Output.

It is a notable fact that, despite the stagnation of the silver industry, there has been no cessation of operations in the great Broken Hill properties in Australia. Unusual attention, therefore, attaches to the publication of the semi-annual statement of the Broken Hill Proprietary Company, which produces three-fourths of the total silver output of Australia and is the largest producing silver mine in the world. It has paid enormous dividends, and there appears to be no intention of suspeoding operations despite the adverse conditions of the market. For the half-year ending May 31, 1893, the product was as follows:

Silver	5,972,194 ozs.
Lead	21,952 tons.
Copper	408 tons.

The average value of each ton of ore produced during the half-year was £4 16s; the cost of treating that ton of ore was £2 18s 10d, the net profit being £1 17s 2d. Each ton of ore which gave that return contained 28·84 oz. of siver and 10.42 per cent of lead, while the price obtained for the silver was a fraction under 3s 5½d per ounce fine, while for lead the average price obtained £11 0s 3d per ton. In comparison with the return obtained during previous half-years these figures do not contrast very satisfactorily, as since 1890 the average yield of silver per ton has decreased from 40 to 31 ozs. in 1892 and 28 in 1893, while the percentage of lead has fallen from 18 per cent in 1890 to 13.53 in 1892 and 10.42 in 1893. To find the explanation for this decrease reference must be made to the last report, in which Manager Howell stated his determination not to draw so extensively as had been the practice heretofore on his reserves of rich ore, but to average them with low-grade material with the view to enabling the latter to be treated profitaly. As the outcome of that policy very large quantities of low and medium-grade ores have been smelted; but the output of silver has far exceeded that of any previous six months, when reliance was placed in the better class of ores. While dealiog with the question of the output of the mine, attention may be directed to the tremendous yield obtained since the property was first opened up in 1885. No less than 44,794,847 ounces of silver have been won and 183,332 tons of lead obtained. This vast output has added wonderfully to the wealth of Australia. The future of the property depends largely on the solution of the sulphide problem. Experiments are being conducted, but they have not been successful, and it seems that after all old-time methods will have to be utilized to render valuable the immense deposits of sulphides which await handling. Mr. Howell appareotly intends to rely on the hyposulphite of soda treatment, which can be worked cheaply and easily. Concerning the contract system, in vogue at the mine, Manager Howell has to say:

The system of stoping ore by contract, or paying by results, is working very satisfactorily and is proving of great benefit to both the men and the company. Nearly all our mining, both underground aod on surface, is now carried througb by contract per cubic yard or at per set of timbers. During the past half-year, the contractors underground have put in place 12,096 square sets of timber, or equal to about 5,800,000 superficial feet at a cost of £40,945 or equal to £3 7s. 8d. per set for mining the ore and putting the timbers in place; the ore output from a space contained by a square set of timbers averages about 13 tons. Shafts have been sunk to an extent of 775 feet at a cost of £2585, or £3 5s. 2d. per foot. Drives and crosscuts have been run 2596 feet in length at a total cost of £3586, or £1 7s. 7d. per foot. Winzes and upraises have been sunk and put up to the extent of 308 feet at a total cost of £596, or at the rate of £1 18s. 8d. per foot, and all this work has been done on contract, the figures given heing labor only. The average number of men employed underground for the half-year ending May 31, 1892 was 1543; the average number employed for the like period in 1893 is 943, or 600 men less engaged at present. I have drawn the comparison between the half-year ending May 1892 and the one just expiring for the reason that during those periods work was in full swing, whereas the intervening half-year's work was interferred with owing to the strike. With these 600 fewer men we have during the past six months extracted 22,064 more tons of ore than we did with the 1543 men last year, and I have gone into figures most carefully and exactly, taking into account the ore on hand at the beginning of the six months, that which came from the surface workings and open cuts, and from everywhere but undergronnd. I can therefore say with confidence that we have extracted over 22,000 tons more of ore, with just under 40 per cent less men. We do not wish it, however, to be understood that a daily average saviog of the wages of 600 men has been made by the change in the system of working, for the men are making much better wages working on contract than under the old system of day's pay.

The amount of dividends paid by the Broken Hill Proprietary Co. since 1885 has been in the neighborhood of £6,500,000 (over $30,000,000). The capital stock is £384,000, in 960,000 shares of 8 shillings each.

An Immense Product.—Manager Howell gives the following detailed statement of ores treated: During the half-year we have treated 230,463 tons of ore, producing 408 tons of copper, 21,952 tons of lead, and 5,972,194 ounces of silver, as per statement following:

PLANT.	Ore Treated	Copper Matte.	PRODUCT. Copper.	Lead.	Silver.
Smelting—	Tons.	Tons.	Tons.	Tons.	Ounces.
Mine Furnaces	153,147	.....	.....	17,741	4,292,627
		772	311	156	90,662

Grand total for half-year	230,463	986	408	21,952	*5,972,194

*Equal to 229,700 ounces per week.

Copper Smelting in Montana.

Great improvements have been made in the smelting of copper in the past ten years, and these are the result, in a great measure, of the experience of Montana metallurgists, writes H. M. Beadle of Helena, to the Montana *Mining Area*.

The Michigan copper mines were the first large producers of copper. There the metal is native, and finely disseminated through the rock. To get it out it is necessary to crush the ore very fine, aod smelt it. The metal needs no porifying, the only foreign element in it being a small percentage of silver. The cost of reducing the metal is very little, and the process simple.

Not so with the Montana ores. These are mostly in combination with sulphur and iron, with small quantities of the ores of zinc, arsenic, antimony, or combination of all of them. The ore occurs generally in larger or smaller bunches in the rock, and as it is much softer than the rock, crushing the rock even coarsely reduces much of the ore into powder, producing slimes, some of which is sure to be carried off and lost. The richer the ore is, the greater is the loss from slimes. In pulverizing such ore finely, to prevent loss, cisterns and vats have to be prepared to settle and collect it, and in spite of everything some of the rich ore is lost. Experience has taught metallurgists to avoid making slimes as much as possible.

Sulphur ore was formerly desulphurized in furnaces operated by hand. This method was tedious and expensive, and prevented any reduction of large quantities of ore, such as we now see in the large smelters of the State. There have been many kinds of furnaces invented for the desulphurization of ores. The O'Hara furnace was one that gave great promise to the metallurgist, bnt as first built it was too costly to operate. Mr. Allen, superintendent of the reduction works of the Butte and Boston Company, Butte, improved the machinery in snch a way as to make it one of the cheapest and most effective calciners that has ever been invented. The Allen-O'Hara will treat from 40 to 60 tons of ore a day, according to the amount of sulphur in the ore, taking out all but from five to six per cent of the sulphur, requiring the labor of only two men to take care of it—one to charge and one to fire—making the cost of calcining the ore in the Allen-O'Hara furnaces in the smelter of the Montana Ore Purchasing Company of Butte (locally known as the Meinze smelter), 62 cents a ton.

The Parrot smelter in Butte was the first to use the Bessemer furnace for converting matte into copper. Since that time it has come ioto common use in the copper refineries. It is used now in the Anaconda smelter, and in the smelter of the Boston and Montana Company at Great Falls. It will also be used at an early day in the Heinze smelter at Butte.

The refining of copper by electricity is a modern method. Copper plating by electricity has long been known, and on the same principle copper is refioed by electricity. But to do it cheaply required the invention of a dynamo of great power, and an extensive plant. There have been many improvements in the process since it was first used a few years ago. The cost now is about one cent a pound, bnt this will no doubt be reduced in the next few years. By this method all the gold and silver is saved and the copper is as pure as it can be made.

The amount of copper ore in Butte mines has been a matter of some speculation in the newspapers. Large developments have been made in the copper mines there to find out whether or not the ore would justify the erection of large smelters. I am credibly informed that in the Anaconda alone there is enough ore in sight to yield 3000 tons a day for 12 years. In the Mountain Tiew the present force of miners could be worked for five years taking out the ore in the parts of the mine already developed. The other mines show equally well as far as developed, and the probability is that the copper mines of Butte are practically inexhaustible.

Origin of Mountain Ranges.

[Abstract of paper read by Professor Joseph Le Conte, of California, before the American Association for the Advancement of Science, Milwaukee, Wisconsin.]

Mountains are focal points of geologic interest and theaters of intense igneous, aqueons and eruptive agencies. Their strata vary in thickness from 10,000 to 50,000 feet at the crest (allowing for erosion), but slope away with diminishing thickness until they vanish in the valleys and plains. Their component materials are fragments of rock, coarse gravels and sands, and their huge mass rises in folded structure above the general surface of the globe. Sometimes, as in the Uinta mountains, there is but a single enormous fold; and again there is fold upon fold; and yet again there is occasionally great complexity, the strata being thrust under and over in a vast fan like form. There are also sinclines and anticlines, which are often greatly oppressed, as in the Appalachian range, where 19 have been counted in a distance of 65 miles. Mountain strata are not equally affected by cleavage, some seeming to be very solid, while in the case of others the whole mountain appears to be cleavage from top to bottom. The earth wave sometimes breaks with surprising abruptness, and again it slopes away very gently.

Many theories have been offered in explanation of these phenomena. Bare facts are not science. Facts must be grouped and systematized. But as this work goes on, it is liable to grow daring and speculative, until it is necessary to demand a careful discrimination between what may be styled formal and casnal theories. It is agreed that mountains were originated by a process of horizontal mashing and vertical uplifting of the earth's crust. But what caused this mashing and uplifting? A true formal theory must advance gradually. Mountains are born of sea-margin deposits. We find by observation that existing offshore deposits are coarse at the top, shading down to fine by the same law as that marked in the structure of mountains. But the enormous mountaioous deposits would have been possible only where there was a corresponding subsidence of sea bottom. The earth sinks by loading and rises by unloading. Of this the Colorado plateau furnishes an illustration. It was originally 20,000 feet high, but 12,000 feet have been removed by erosion, which has caused the remaining 8000 feet to rise above the general level. It may be regarded as now proved that the cosmic behavior of the earth is that of a rigid solid. A solid globe of glass, six feet in diameter, will change shape by the pressure of its own weight. The earth does the same. But as the earth is not homogeneous, its radial contraction will be ridges. The contraction theory assumes that the earth was once an incandescent ball, now cooling; and this cooling compels yielding along its lines of weakness. This is known abroad as the "American theory," and the author of this address was its originator. In conclusion, Prof. Le Conte said he was ready, if need be, to sacrifice "the child of his brain," but did not really think it necessary. He considered and refuted objections; and he finally returned to the contraction theory, not as demonstrated beyond a doubt, but as furnishing the best working hypothesis yet offered.

Aluminium for Cages and Cables.

According to the *Moniteur Industriel*, the engineers of the principal coal mines of the north, in France, are studying the application of aluminium to the manufacture of cages, cables, etc. The difference in weight between aluminium and iron and steel, is considerable, and consequently the use of the former would increase the load capacity; on the other hand, the continuous lowering of the price of the metal renders its use possible. While it is possible that the use of aluminium as the material for certain mining apparatus or parts of apparatus is feasible, says the *Engineering Magazine*, it is doubtful whether in the present stage of aluminium metallurgy and manufacture, engineers would care to rely upon hoisting cables made of aluminium. Steel wire, either in round laid or flat woven cables, is an extremely reliable material, and one knows exactly what to expect of it; while in any event it will probably be a long time before aluminium manufactnre has so advanced that the same reliance can be placed upon it. Weight for weight, the steel cables would now be preferred. Accidents from their breakage are extremely rare. The increased diameter of equivalent aluminium cables would be a disadvantage, while their non-corrosibility would be in their favor.

Electricity in Mining.

The following is an abstract of a paper by F. O. Blackwell, presented before the American Institute of Mining Engioeers, at the Chicago meeting, which formed a part (Division C) of the International Engineering Congress, August, 1893:

It is roughly estimated that some 300 companies in the United States engaged in mining and the kindred arts now employ electricity in their operations. As all these plants have been installed within the last few years, it is evident that mining engineers have been quick to appreciate the great advantage of the use of electricity and adopt it for their many requirements.

Electricity tried under the arduous conditions of mining service has been shown to be peculiarly efficient, safe and reliable. It presents a system of the greatest simplicity, completeness and flexibility, permitting power from one source to be distributed in units of any desired size and for any purpose to the places where it can be employed to the greatest advantage, thereby securing the minimum consumption of power and expenditure of labor. With electricity there is neither friction, heat nor condensation. There is no leakage nor loss of power when not in use, which especially recommends it for intermittent work. It is not affected by heat or cold, and does not vitiate the air, as is the case with steam and compressed air. The rapid deterioratlon of timbering, a source of great expense in all mines, due to bad alr and heat, is, to a great extent, obviated. It has been urged against electricity that it increased the risk of fire. As a matter of fact it greatly decreases it, as the statistics of insurance companies testify. With proper safety devices and a system of concentric wlring it is practically impossible to start a fire from the current. To the engineer accustomed to speed indicators, pressure gauges and indicator cards, electrical methods of measurement seem particularly simple. The work being done by motor or generator at any instant can be read directly from a scale, and, if desired, automatically recorded. If necessary, motors can be controlled from a distance without difficulty.

The prime source of power is first to be considered. By conversion into electrical energy, water power, even at a considerable distaoce from the mine or mill, can be made valuable for all purposes, and steam power can be so located as to secure fuel and water cheaply. In addition to this, one large engine costs less, is more evenly loaded, requires less attendance, and is necessarily more efficient than a number of small ones. The introduction of electricity has in this way made important reductions in the cost of power, and there are cases in which it would be impossible to run without its help. An example is furnished by the Virginius mine at Ouray, Colo.; 300 H. P. is carried at 800 volts from a water power four miles distant. The cost of coal at the mine was formerly $18 per ton, which would amount, for the present plant, to about $80,000 per year, equaling the total cost of the electric plant. The item of fuel was a complete saving, the expense of operating the steam and electric plant being about the same in other respects. Several mines in Colorado are operated by electricity that could not be operated by steam on account of their situation on the face of precipitous cliffs, up which the transportatlon of water and fuel would be nearly impossible. The character of the country over which the power had to be carried for the Virginius plant is exceedingly rough. A portion is at an elevation of 12,700 ft. abcve sea level and well above the snow line.

Electric Generators.—Generators can now be obtained of any size and designed to run at any reasonable speed for belting or direct connection to engines or water-wheels. The largest generator in the world is now running at the power station of the intramural electric railway at the Columbian Exposition, in Chicago. It is of 2000 H. P., and directly connected to a compound condensing engine running at 75 revolutions. The electric generator is substantially the same as the motor, and both can be relied upon to give an efficiency of from 90 to 95 per cent.

Electric Power Transmission and Distribution.—The cost of copper with any fixed loss, power and distance varies inversely as the square of the voltage. It is, therefore, evident that as high a voltage as possible should be used if economy of copper alone is to be considered. When the power is carried over long distances the cost of copper is the largest item of expense. For general distrlbution, especially underground, convenience of insulation and handling are of more importance and cali for low potential. Nearly all the plants now in operation are supplied with current at 220 or 500 volts. There are a number, however, in which voltages of 1000 and over are in use; notably at the Poorman, Comstock and Calumet & Hecla mines. When bare wires are used, as for haulage, we are limited to a potential of 500 volts. Direct current generators are confined, by difficulties of construction, to potentials of less than 1500 volts. The distance over which direct current can be economically carried at this potential is about four miles. Above this point alternating currents are used.

The long distance transmissioo of power was first brought prominently before the public by the experimental line between Lauffen and Frankfort two years ago. The power of the Lauffen Falls was converted into electricity, transmitted 115 miles to the exposition at Frankfort, and there operated a number of motors. The distance was beyood the limits of commercial success, but it demonstrated the possibility of the system. To-day plants are in operation and transmitting current for light and power at Walla Walla, Hartford, Portland, Pomona and Telluride. The distances vary from 4 to 13 miles.

Alternating currents are particularly desirable on account of the ease with which the electrical pressure can be chaoged. By meaos of transformers without moving parts the high potential used for transmission is converted into low pressure for distribution. Alternating generators are wound for as high as 5000 volts, but it will probably be found better to limit them to 2500 volts. This potential permits of economical transmission for a distance of seven or eight miles. Above that distance step-up and step-down transformers are used. At present we do not care to go above 10,000 volts, which places the limit of about 25 miles to practical work. Alternating current motors possess nearly the same properties as those built for direct current. They have the advantage of being commutatorless, but cannot be sn heavily overloaded as a series wound direct current motor. They are, therefore, not as suitable for railway or hoisting service. Direct current can, however, be readily obtained from alternating by means of a rotary transformer which is a combined alternating motor and direct current generator. Motors have been designed to meet all the special requirements of mining work, and I will give a short description of some of the more recent applications.

Electric Haulage.—In no application of electricity except lighting has such success been met with as in the operation of railways. For underground haulage the ready control, compactness and freedom from smoke render it desirable, and already electric locomotives are in some 30 mines. I would call particular attention to the saving that can be effected in the size of entries. The electric locomotive is so designed as to occupy no more space than the car which it is to haul. The iocreased speed also permits a larger tonnage to be taken from the same outlet and with fewer turnouts, switches and cars. Locomotives are now to be obtained of any size and to operate on any track gauge not less than 18 ins. For mining haulage large sizes are not required; those now in use vary from 150 to 10 H. P., the most common size being 30 H. P. At Rock Springs, Wyo., there is in operatlon a locomotive of 80 H. P. It is operated by a single motor, geared to both axles, the connection to the axles, however, being made a flexible coupling, allowing the entire weight to be supported on springs. No part of the wheels is wider or higher than the wheels. The larger sizes of locomotives generally are constructed wlth one motor, and the smaller with two. All locomotives in use are controlled by rheostats, and the speed under load varies from 6 to 12 miles per hour.

Electric Hoisting.—Electric hoists are now largely in use and follow as nearly as possible the methods and construction approved for steam hoists. The governing mechanism is similar, rheostats replacing the steam controlling gear, and the brakes and clutches are the same. The rotary motion of the motor avoids the use of connecting rods entirely. If it is desired to lower by power the current can be admitted to the reversed motor. For small hoists used in winze and timber construction work, electricity is well adapted, the power connection being easily and quickly changed. The double drum hoist is designed for a double compartment shaft, and is furnished with post brakes and jaw clutches of the ordinary pattern. Special hoists for use underground are equipped with iron-clad motors so as to be thoroughly protected. An efficiency of from 50 to 60 per cent is usually obtained between the power taken by the motor and the foot-pounds hoisted.

Electric Pumping.—A number of large pumping plants are now in operation equipped with electric motors. It is necessary in order to turn the reciprocating motion of a plunger pump into rotary, to equip it with crank shaft and connecting rods. This at the same time insures a steady flow of water. Some difficulty ls experienced in cutting down the speed of electric pumps as is done with steam. The general practice has been to stop and start ln order to decrease the capacity. The best method, and one going largely into use, is to make the fields of such strength as to give the minimum speed desired, so that by decreasing the current in them the speed may be lncreased up to a maximum output. Where many pumps are in operation of nearly the same size, a convenient method of regulation is to throw the pumps into multiple series combinations with each other. They may also be controlled by varyiog the electromotive force supplied them from the generators. Rheostats answer well enough for small pumps. Triplex single-acting and duplex and trlplex double-acting all work well and give ao efficiency of over 70 per cent between the electric power taken by the motor and the water delivered by the pumps. If the lift is small, and the water contains much solid matter, centrifugal pumps may be used, but their efficiency is low. At the World's Columbian Exposition exhibit of the General Electric Co. is shown a Blake pump directly connected to a slow-speed multipolar motor of 100-horse power, requiring only one gear reduction. The capacity of the pump is 500 gallons at 500 feet head. A sinkiog pump of 120 gallons capacity to work against 200 feet head has been made, the motor and gearing being completely inclosed ln a cast steel case, and cannot be damaged by being flooded.

Electric Air Compressors.—The statements made above regarding hydraulic pumps apply equally well to air compressors, except that as air has not the inertia of water it can be automatically loaded and nnloaded without throwing any strains oo the mechanism, the motor running constantly at a fixed speed. A decided savlng of power can be effected by locating drill compressors near to the drills, and thus avoiding losses by leakage and shrinkage in the pipes.

Electric Drilling.—Although it has been a matter of great difficulty to make an electric percussion drill which would stand the continual abuse and hard usage to which air drills are subjected, they are at preseot in constant and snccessful operation. By care in designing the coils so as to make them fireproof and rigid they have been made to stand the strain. The drill consists of an outer iron pipe casing inside of and attached to whlch are two coils and the ratchet mechanism. The plunger, equipped wlth the ordinary chuck and rifle nut, is in the center of the coils. The coils are supplied with current alternately, and draw the plunger up and down at a speed fixed by the generator which supplies the current. Electric diamond drills are in use for drilling solid holes and for removing cores for prospecting purposes. For prospecting both above and underground the electric drill is particularly available, as it is extremely llght and compact, and temporary wires can be run to places where it would be difficult to carry steam pipes or boilers. A diamond prospecting drill with hoist and pump, driven by a 2¾ H. P. motor, will remove a 1⅜ core, and can drill 600 feet deep without difficulty.

Electric Lighting.—It has been found that much more work can be gotten from men by giving them better illumination. By avoiding the use of oil lamps and candles the air is left purer, and both time and power saved by doing work underground which would otherwise have to be done on the surface. Electric lighting also reduces the risk of accident by calling attention to conditions which would otherwise pass unnoticed. In gaseous mines, where many explosions have resulted from the reckless use of miners' lamps, electric lighting is invaluable.

The Improved Cyanide Process.

The MacArthur-Forrest (cyanide) process of ore reduction has undergone some improvement in the past eighteen months. As lt is now used on the Transvaal gold fields it is thus described:

This process is chemlcal and may be considered the only one on the Transvaal fields from which commercial results have so far been obtained. Cyanide ot potassium, which is the active principle in the process, was known to be capable of holding gold in solution, and was actually used for that purpose in the arts long before the MacArthur-Forrest process was heard of; but its application to extracting gold from ore, and subsequently precipitating it cheaply, is unquestionably a discovery of some importance, the validity of the pateot of which some have doubted, but which has been successfully maintained in the Supreme Federal Court of America. The process itself is sufficiently simple. A solution of cyanide of potassium is run into a vat contalning the ore, and is allowed thirty hours to percolate through the mass into a rough filter below, whence it is run through the boxes, which are filled with zinc shavings, so cut as to present the maximum amount of surface. Entering at the bottom of the boxes, the solution is forced up through the shavings, and enters at the bottom of the next box, through the whole series of which it passes. The gold, which, after it leaves the vat, is io the form of a cyanide, is precipitated on the zinc, which it gradually replaces,and then is easily recoverable by fusion in the form of fine metallic gold. The solution is available for further use by a slight addition of cyanogen. By allowing the ore to remain in the solution for thirty hours, it is claimed that 80 per cent of the assay value is recoverable; and that by increasing the lime and agitating the ore, anything between 98 and 99 per cent can be extracted. Obviously, whether the former or the latter method is the more advisable depends wholly on the value of the tailings or concentrates. In the case of 20-oz. concentrates, the 4 ounces which by the longer treatment would be recovered are worth the extra expenditure of time, while it is equally clear that in the case of 10-dwt. or 12-dwt. stuff, such a course would not be warranted.

Coming to the important question of expense, lt is claimed that the whole cost is less than that involved io the preliminary operation of roasting in any of the chlorination processes. No accurate calculation has been published, but it was stated at the meeting of the parent syndicate at Glasgow, sometime last year, that $2.25 per ton of tailings might be regarded as a fair estimate, and it is probable that that figure would not be exceeded in Johannesburg. This, however, only applies to low-grade tailings, the cost being regulated by the amount of cyanide used, which again is proportioned to the value of the ore (it now being shown that the capacity of cyanide for holding gold ln solution is strictly limited), so that in the case of rich concentrates the expense may be increased almost indefinitely. The process is at work in New Zealand, where the results have been favorable, and it is stated that it is the only treatment to which the tailings from one mine on the Thames gold-fields have been found to yield. So far, however, the South African patents, which are owned by the African Gold Recovery Company, have proved by far the most valuable of any. At the Robinson mine, work has been going on sioce the beginning of the year, and in the first five months 6266 ounces were returned.

The Big Bowman's Dam.

In course of a recent letter to the *Tidings* relative to the hydraulic mines of Nevada county Samuel Butler says of the North Bloomfield mine and the famous Bowman's dam: The North Bloomfield mine is situated three-fourths of a mile southwest of the town of North Bloomfield, at an altitude of 3150 feet, and is a consolidation of many claims, the whole aggregating 1535 acres. Of this area about one-fourth consists of auriferous gravel resting in ancient river channels. The general course of the main channel is northeast and southwest. The formation is black slate. The company has driven 10,135 feet of tunnels at a cost of $798,000. This company's water plant is next in size and extent to the South Yuba Canal Company. Operations were commenced on a large scale in 1872, in which year the now famous Bowman's dam was constructed. This reservoir, together with several smaller ones adjacent, will hold 450,000 miner's inches of water.

Bowman's dam is so well knowo to the majority of our pleasure seekers that an extended notice is unnecessary; but for the benefit of those unacquaioted with the topography of the country I may state that this famous dam is situated in a small valley in the mountains, on a tributary of the South Yuba river. At high-water mark the surface area of the reservoir is 502 acres. The dam, constructed in a narrow gorge at the outlet of the valley, is 425 feet long and 100 feet high, very substantially built of heavy cedar and tamarack.

Important to all Applicants for Engineer's License.

A New Revised and Enlarged Edition of

EDWARDS' EXAMINATION QUESTIONS AND ANSWERS

JUST READY.

Edwards' 900 Examination Questions and Answers for Engineers and Firemen (Stationary and Marine) who desire to obtain a U. S. Government or State License. By Emory Edwards, Marine and Mechanical Engineer.

A New, Revised and Enlarged Edition, 500 pages. Full bound, in pocketbook form, leather, gilt edges. Price $1.50, by mail, free of postage to any address in the world.

☞ *A circular showing in full the very elaborate index to this important book will be sent free of postage to any one who will apply.*

BY THE SAME AUTHOR.

The Practical Steam Engineers' Guide in the Design, Construction and Management of American Stationary, Portable and Steam Fire Engines, Steam Pumps, Boilers, Injectors, Governors, Indicators, Pistons and Rings, Safety Valves and Steam Gauges. For the Use of Engineers, Firemen and Steam Users. By Emory Edwards. 119 Engravings. 420 pages, 12mo Price.....$2.50

TENTH THOUSAND.

The American Steam Engineer, Theoretical and Practical; with Examples of the Latest and Most Approved American Practice in the Design and Construction of Steam Engines and Boilers of Every Description. For the Use of Engineers, Machinists, Boiler Makers and Students. By Emory Edwards, M. E. 77 Engravings. 12mo, 419 pages. Price.....$2.50

Modern American Marine Engines, Boilers and Screw Propellers. Their Design and Construction. Showing the Present Practice of the Most Eminent Engineers and Marine Engine Builders in the United States. By Emory Edwards. Illustrated by 30 large and elaborate plates. 4to. Price.....$5.00

The American Marine Engineer. Theoretical and Practical; with Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By Emory Edwards. 85 Engravings. 12mo. 435 pages Price.....$2.50

A Catechism of the Marine Steam Engine. For the Use of Engineers, Firemen and Mechanics. A Practical Work for Practical Men. Illustrated by 63 Engravings, including Examples of the Most Modern Engines. Fifth Edition, thoroughly revised, with much new matter. 12mo, 414 pages. Price.....$2.00

Modern American Locomotive Engines. Their Design, Construction and Management. Illustrated by 78 Engravings. 12mo, 383 pages. Price.....$2.00

☞ *The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.*

☞ *Illustrated Circulars, showing full Tables of Contents of all of the above Valuable Books, will be sent free to any one in any part of the world who will send his address.*

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, as well as our other catalogues and circulars, the whole covering every branch of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish his address.*

DEWEY & CO.'S

Scientific Press **Patent Agency.**

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

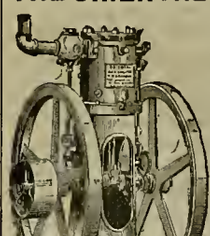
THE ORIENTAL GAS ENGINE



IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

Mechanical Progress.

Coal Endurance of United States Cruisers.

Ira N. Hollis, of the United States Navy, in the "Journal of the American Society of Naval Engineers," compares the actual consumption of coal on long voyages with the estimated radius of action in certain of the new ships. The coal used from port to port, includiog all expenditures, is slmply divided by the number of days in the voyage, and the endurance worked out from the result. The estimated radius of action of the Charleston, at ten knots, with 760 tnns of coal, 1200 I. H. P., was 7013 knots. On service it was found to be 4450 knots, with a clean bottom, and 2920 knots when the bottom was foul. It thus appears that, while the estimate was based upon a total consumption of 2 pounds per I. H. P. per hour, the consumption for all purposes amounted tn from 3.5 to 4.87 pounds, depending upon the condition or the bottom. At the most economical rate of speed, 8.8 knots, a clean bottom, fair weather and only absolutely necessary expenditure for ordinary purposes, the steaming radius is 5670 knots. This corresponds to about 4 pounds per I. H. P. per hour of the maln engines. The expenditure for galley, dynamo, distilliog, etc., was 2.9 tons per day. The calculated radius of action of the Yorktown at 8 knots, with 380 tons of coal, was 11,670 knots. On service, it proved to be 4800, which is at the rate of 3.75 pounds per I. H. P. per hour nf main engines. The steaming radius, with only absolutely necessary expenditure upon auxiliaries, is 5130 knots. This vessel is put down at 93 days' endurance in the theoretical calculations, whereas she could not keep the sea more than 25 days. The economical speed is found to be from one-half the maximum speed to one knot more than the half, varying somewhat with the coal expended for auxiliary purposes. The coal consumption is approxlmately 1 ton per 100 tons displacement per day for vessels below 5000 tons. The speed obtained with one screw is estimated at about three-fourths of that nbtained with both on the same consumption of coal. The steaming radius is given of a number of new ships, with a very full analysis of the expenditure of fuel for the different services on board.

About Steam Gauges.

Very few steam gauges are correct throughout the whole range of the scale, as they will vary more or less at different pressures. In testing a gauge to ascertain its correctness, it is always well to make the pressure at which steam is usually carried the most important point to he determined. A gauge may be all right at low pressure and not right at higher pressures, and the reverse may be found, especially with gauges that have been in use for some time. By many it is not considered advisable to use a gauge for recording pressnres as high as that shown on the dial, for few springs will stand such an extension without becoming permanently set, to a certain extent, and especially is this the case with the cheaper gauges. It is not a difficult matter to devise means for comparing with a test gauge, as any kind of force pump will serve the purpose, and in the abseoce of a special pump the boiler feed pump can be utilized. Gauges can be tested by fitting them to a piece of lead pipe, a gauge at either end, the pipe being bent to hring the gauges vertically. The pipe should be filled with water and then inserted between the jaws of a vise, when screwing up on the vise will bring pressure to bear on both gauges. This is, perhaps, as convenient a way as any, providing the lead plpe can be obtained, for in the absence of a vise a lever can be applied which will serve a similar purpose. An occasional test of a gauge should be made, says a writer in the Boston *Journal of Commerce*, if its indlcations are to be relied upon, and it is better to keep the pressure gauge in good order, and be certain that it records correctly, than to depend on the safety valve, whether of the lever or spring type, for these, too, are liable to improper working, if not given proper attention.

How Circular Saws are Made.

These saws are now made of cast steel specially manufactured for the purpose. An ingot heated to the requisite temperature is reduced to the proper thickness in powerful rolls. The plate is then centered and a clrcle scribed upon it, after which it is passed to the shearer, who reduces it to a circular form. The center hole, says *Work*, is then bored. It is then handed to the toother, who punches out the teeth around the edge, after which they are rough filed or ground on an emery wheel, to take off the burr left by punching.

The rough saw is now again heated in a large furnace until it is of a bright red color. It is then plunged into a bath of sperm oil, which makes it hard and brittle. The oil is then partly cleaned off, and the rest burnt off in a furnace to give the saw the required temper. When cold the saw is hammered on a steel-faced anvil until it is straight. It is next ground between vertical grindstones revolving in opposite directions, and then polished with emery on a large disk.

Once more the hammer men take it, and strike it with smooth-faced hammers on an anvil as before, until it is absolutely stralght and true, and has acquired the proper tension which allows for expansion while the saw is revolving at work. The teeth are now set, alteroately right and left, to allow for clearance when sawing timber. They are then sharpened by being filed on the front and tops of the teeth, which operation completes the manufacture.

What is a Corliss Engine?

One not versed in matters pertaining to the steam engioe, and ignorant of just what constitutes a Corliss engine, might have considerable difficulty in these days to determine what a Corliss engine is or was, says the *American Machinist*. The distinctive features of this engine, as huilt by its originator, were in the form of bed; ln having two steam valves at either end of the cylinder on top, and two exhaust valves at either end below; in its round or cylindrical valves, with their oscillating motinn; in its wrist-plate motioo for actuating these valves; and finally in the detaching device for enabling the governor to control the point of cut-off. Our ignorant visitors to the expositioo at Chicago who should go about the power plant there might conclude not only that any one of these features might be dispensed with, and the engine still be a Corliss; but that nearly all of them could he discarded, and still the name would apply. There are Corliss engines there that have not the Corliss form of bed-plate; others that have no oscillating valves; others that have no detaching devices; and stlll others that have no wrist-plate motion. Usage seems almost to have justified the application of the name Corliss to any engine which has four valves and an automatic variable cut-off.

Type-Setting Machines.

In type-setting machinery the application of mechanics to the art of printing is reaching a culmination. It ls stated that during the last 20 years upward of $9,000,000 have been expended in bringing the art of setting type by machinery up to its present state. Now, for all plain work, type-setting machines are available, says the *Engineering Magazine*. In the London *Times* office a curious arrangement has been adopted for the composition of the stenographic notes of the Parliamentary reporters in the House of Commons, in which type-setting machines play an important part. The stenographic notes are read directly to the operators of the machines, instead of being transcribed, as was formerly the case. Men at telephones in the House of Commons read these notes to men stationed at receivers in the *Times* composing rooms, who in turn read them to the type-setters. In this way these notes can be set up in type almost as rapidly as they could be transcribed by an expert typewriter; and it is said that the number of errors that creep in are not so numerous as to make the work of correcting proof much greater than by the old system, while a considerable saving in time and expense is effected.

An Improved Wire-Nail Maohine.

Among the many machine novelties now on exhibition at Chicago is an improved wire-nail machine, which, instead of taking in one wire, as those now in use do, runs five wires at once and turns out five nails at each stroke of the machine. There are two of these machines at work—one weighing only 1500 pounds, which will turn out 900 four-penny nails per minute; another larger one, weighing 3600 pounds, will make 750 eight-penny nails per minute. The decrease of weight of machinery, in proportion to the amouot of work done, is about four to one of the single-wire machines. This implies also a great decrease in the power required —about one-half. Twenty-one of these machines, it is claimed, wlll do the work of 100 single-wire machlnes, and at one-third less cost for labor. The cost of one five-wire machine is only about one-half that of five single-wire machines. There is also large economy in floor space.

One of the specifications in the patent as allowed is "the feeding of several lines of wire in a machine for making headed articles from wire." This is a sweeping claim, which makes all improvements tributary to the original invention—as did the eye in the point of the sewiog-machine needle.

If the claims of this machine are not overstated it will greatly reduce the cost of wire nails, and should also, to a certain extent, reduce their price.

Scientific Progress.

Length of Geologic Time.

In a paper before the American Association for the Advancement of Science, at Mllwaukee, Wis., Prof. C. D. Walcott, of Washington, D. C., attempted to define the limlts of geologic time. Sir Charles Lyell, basing hls estimate on modifications of certaln specimens of marine life, assigned 240,000,000 years as the required length of geologic time. Darwin claimed 200,000,000 years; Crowell, about 72,000,000; Geikie, from 73,000,000 upward; Alexander Winchell, but 3,000,000; McGee, Upham and other recent authorities claim from 100,000,000 up to 680,000,000 years. Notwithstanding this wide divergence, all agree in thinkiog the duration of the globe so great as to make man's occupancy of it seem but a span. The conclusion reached by Professor Walcott distributed geologic time as follows:

Cenozoic (including Pleistocene), about	2,900,000
Mesozoic	7,240,000
Palezoic	17,500,000
Algonkian	17,500,000
Total time of sedimentary rocks	45,500,000

The conditions on which denudation and deposition went on were given with minuteness and a formidable array of figures. As a specimen of Prof. Walcott's reasoning, it may be said that the rocks in the great interior basin of Nevada, Utah, etc., are 21,000 feet thlck, and cover an area of 400,000 square miles. The limestones are 6000 feet and the sandstones and shales 15,000 feet. At the estimated rate of deposit in the ocean of the present day lt requlred 1,200,000 years for the limestones of that area and 16,000,000 for the sandstones and shales, or 17,500,000 in all. With this as a unit, the tabular results were reached as already given. In other words, as compared with the conclusions of other geologists, Walcott would measure geologic time, not by hundreds of millions of years, but simply by teos of millions.

Greatest Depth of the Paoific.

TO THE EDITOR:—A recent article in your valuable journal, treating of ocean depths, gives the maximum so far known in the Atlantic, viz., 3875 fathoms. This is not the deepest water in the world, however. As the subject, in these days of telegraph cables, may interest many of your readers, allow me to state what has been found in the Pacific. In 1874 the U. S. S. Tuscarora, Capt. Belknap, while surveying for a cable hed, only about 100 miles off the coast of Japan, played out 4643 fathoms of wire (27,858 feet) without finding bottom. The wire then broke. This was too deep for cable laying, and the ship, running inshore, went considerably to the north and started on a new line. But again the water deepened rapidly, until the lead touched bottom in 4340 fathoms. The thermometer came up completely wrecked by the heavy pressure.

The next six soundings, at 40 miles apart, gave depths of 4356, 4041, 4234, 4120, 4411 and 4655 fathoms, about 5¼ miles. This line was not explored farther.

The figures are from the interesting paper of Commander Z. L. Tanner, U. S. N., read before the Geographical Soclety of the Pacific last winter. JOHN PARTRIDGE,

Secretary Geographical Society of the Pacific.

San Francisco, Sept. 7, 1893.

Diamonds in the Laboratory.

Henri Moissan, a Frenchman whose name has lately been promlnent in chemistry in connection with several important discoveries, declares he has finally succeeded in obtaining in his laboratory minute crystals of diamonds. The discovery is not absolutely new, and the French chemist himself mentions two of his English predecessors, says Prince Kropotkin in the *Popular Science Monthly*. Mr. Hannay obtalned in 1880 some diamond-like crystals by heating in an iron tube, under high pressure, a mixture of paraffine oil with lamp-black, bone oil and some lithium; and in the same year Sidney Marsden, by heating some silver with sugar charcoal, obtained black carbon crystals with curved edges. Besides, it was generally known that a black composed of transparent microscopical crystals, having the hardness of diamond, is deposited on the negative electrode when a weak galvanic current ls passed through liquid chloride of carbon. But these crystals, like those of Mr. Marsden, belong to the easily-obtained variety of black diamonds known as carbonados, while some of the crystals obtained by Moissan are real colorless and crystallized diamonds—the gem we all know and admire.

For industry and every-day life the infioitesimal quaotities of dlamond dust obtained by the French chemist may have no immediate value, and some time will probably be required before a modest-sized jewel is made in a laboratory.

Determining Straightness by Sight.

The straightest thing in nature or art is a ray of light when passing through a medium of uniform density; hence the eye is enabled to test the straightness of an edge or tube by holding it as nearly as possible coincident with a ray of light, such parts as depart from straightness then intercepting the ray and causlng a shade to be cast upon other parts, says the *Engineering Magazine*. It is not known at what early period in the history of mankind the discovery was made that

straightness could be thus determined. It is certain that thousands of mechanics use the methods daily without being able to give a rational explanation of it. This primitive mode of testing straightness, on accouot of its great convenience and accuracy, is likely to continue in nse to the end of the world.

How the Earth Will Die.

M. Camille Flammarion says that, in all probability, notwithstanding all circumstances which threaten it, our planet will die, not of any accideot, but a natural death. That death will be the consequence of the extinction of the sun, in twenty million years or more—perhaps thirty—since condensation in a relatively moderate rate will give it on one hand seventeen million years of existence, while, on the other hand, the inevitable fall of meteors into the sun may double this number. Even If you suppose the duration of the sun to be prolonged to forty million years, it is still incontestable that the radiation from the sun cools it, and that the temperature of all bodies tends to an equilibrium. Then the earth and all the other planets of our system will cease to be the abode of life. They will be erased from the great book, and will revolve black cemeteries around an extinguished sun.

Will these planets continue to exist even then? Yes, probably, in the case of Jupiter and perhaps Saturn. No, beyond a doubt, for the small bodies, such as the Earth, Venns, Mars, Mercury and the moon. Already the moon appears to have preceded us toward the final desert. Mars is much further advanced than the earth toward the same destiny. Venus, younger than us, will doubtless survive us. These little worlds lose their elements of vitality much faster than the sun loses its heat. From century to century, from year to year, from day to day, from hour to bour, the surface of the earth is transformed. On the one hand, the continents are crumbling away and becoming covered by the sea, whicb insensibly and by slow degrees tends to invade and submerge the entire globe; on the other hand, the amount of water on the surface of the globe is diminishing. A careful and reasonable calculation shows tbat by the action of erasure alone all the land on our planet will be covered by water In 10,000,000 years.

Scientific Notes.

—Prof. Lippman has succeeded In photographing simultaneously all the colors of tbe rainbow on a layer of albumen.

—Dr. Gallipe reports to the French Academy of Sciences, after eight years investigation, that all stones, such as gravel, found in the human body, are produced by microbes. Microbes are the authors of that chemical decomposition which results in calcareous deposits.

—It is said tbat a new industry has sprung up in France, the selling of milk frozen solid in cans. It has been discovered that milk can be kept perfectly fresh in a frozen conditlon for more than a month. It is frozen by means of an ordinary ice-making macbine, and dispatcbed by road, rail or steamer to its destination. The customer wbo purchases tbe frozen milk has simply to thaw it when it is required for use.

—Dr. Bowdler Sharpe suggested in a recent lecture on the geographical distribution of birds, before the Royal Institution of London, that there was once a great continent, with its center at tbe South Pole, now submerged under 2000 fathoms of ocean. It embraced, he said, South America, Madagascar, Mauritius, New Zealand and Australia; and thus he explained the existence of the cognate struthious birds that now exist, or once existed, in those countries.

—Prof. E. S. Holden says that if the brightness of a star seen with tbe eye alone is designated hy one, with a two-inch telescope it is 100 times as bright, with a four-inch telescope it is 400 times as bright, eigbt-inch telescope it is 1600 tlmes as bright, 16-inch telescope it is 6400 times as bright, 32-inch telescope it is 25,600 times as bright, 36-inch telescope it is 32,400 times as bright. That is, stars can be seen with the 36-incb telescope tbat are 30,000 times fainter tban tbe faintest stars visible to the naked eye.

STAMP MILLS.

VULCAN WIRE ROPEWAY

for Conveying ORE, CORDWOOD, ETC.

SNYDER MINE, KENNETT, CAL.

In reply to inquiry as to how Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR.

JUDKINS TRAMWAY CO., POMEROY, WASH.

It will give us great pleasure to recommend your Ropeway and your Company as well to any persons who may be thinking of erecting Ropeways.

VENTANAS M. & M. CO. VENTANAS, MEX.

We take pleasure in testifying to the successful operation of the Vulcan Wire Ropeway furnished us by your company. It easily transports the required quantity of ore from mine to mill and has given us no trouble whatever.

VULCAN IRON WORKS,
135-145 Fremont St., S. F.

FRANCIS SMITH & CO.,
MANUFACTURER OF

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
NO. 130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coat Tar and Asphaltum.

HEALD'S

BUSINESS COLLEGE.
24 POST STREET.....SAN FRANCISCO.
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. ☞ SEND FOR CIRCULAR. E. P. HEALD, Pres. C. S. HALEY, Sec.

Electricity.

The Niagara Falls Electric Plant.

At the recent Electrical Congress in Chicago, Professor George Forbes, electrician of the Cataract Construction Company, told of the purposes of the company in utilizing the power of Niagara Falls. The aim is ultimately to supply power not only to factories in the vicinity of the falls, but to Buffalo, Rochester, Utica, Syracuse and Albany, and perhaps also to supply power to propel the boats on the Erie and other canals in New York State. The plant at the falls is thus described briefly: The water falls through penstocks 140 feet deep, at the bottom of which are turbines (Leffel's wheel) with vertical shafts. All discharge water goes into a large tunnel opening below the falls. The revolving field magnets of the dynamo are directly on the same vertical shafts. The armatures of the dynamos are stationary and are wound so as to give directly a pressure of 20,000 volts, thus dispensing with transformers at the generating station. At the receiving stations the pressure will be lowered by transformers to a safe pressure to handle. The same pressure on the mains will be used for distribution to points near and at a distance in order to avoid complexity of wiring and to save copper. The wires will be caried partly on poles and partly in subways.

In the discussion following, Dr. Bell thought the utilization of electricity for towing on the Erie canal was not so near as might he. The overhead line would be difficult to keep up, and the conduit was commercially impossible. We must employ overhead bare wires. No insulation that could be put on would stand high voltage. In theory the conduit was all right, but commercially its cost prohibited it. As regards the distance over which power could be transmitted, he did not think any one would care to set the limit. A distance of 50 miles and under was enough to keep all busy for the next decade. If only coal was cheap enough, power could be transmitted any distance. It was thus more of a commercial than an electrical problem.

Electricity at the World's Fair.

The current number of the *Cosmopolitan Magazine* contains, among many other interesting articles on the World's Fair, one by Murat Halstead on the electrical service. Mr. Halstead says in part: "The whole electrical service at the exposition comprises these systems: Arc lighting, incandescent lighting, electric power, telephone service, police signal service, fire alarm service, telegraph service, electric transportation. There are many minor matters with new applications of electricity. In 1889, in Paris, far the greatest of preceding expositions and the only one with which it is worth while to compare the Columbian Fair, there was used for electric lighting 3000-horse power. There is devoted in Chicago to electric light and power in the main plant alone 17,000-horse power—14,000 for light and 3000 for the transmission of power. There is 1000-horse power in addition in isolated plants and 5000-horse power for the plant of the intramural railway company. The aggregate is 23,000-horse power. The Paris exposition electric lighting was furnished by 1150 arc and 10,000 incandescent lamps—about 1,000,000-candle power. The Chicago electrical illumination at the fair is provided by 90,000 incandescent lights of 16-candle power, and over 5000 arc lamps—a total of 11,400,000-candle power. These figures are from original estimates that have been largely exceeded. The reserved forces brought up the grand total capacity of the electric plant to 5000 arcs of 2000-candle power each, and 120,000 incandescent lights of 16-candle power, the total amounting to about eight times all the plants at Paris. The greatest electrical feature we cannot, however, compare with anything in Paris, because it is new; this is the almost exclusive use of electricity for the transmission of power.

New Electric Arc Lamp.

In a paper before the recent Electrical Congress at Chicago, Prof. W. D. Marks described a new form of electric arc lamp, invented by Louis E. Howard of New York City. The carbons are inclosed in a tight glass globe of small size, closely fitted to the lower carbon, and fitted to the upper carbon as tightly as is possible without interfering with its motion. When current is first turned on the oxygen contained in the air in the interior of the globe at once combines with the carbon to form carbonic dioxide, so that the globe is soon filled with a mixture of inert gases which cannot support combustion. The carbon vapor from the glowing arc is deposited on the interior of the glass and so confines the radiant energy from the arc that the whole globe and the gases within it become heated to a high temperature and glow like the carbon in an incandescent lamp. The arc itself can hardly be distinguished, the light appearing to proceed from the whole mass of the globe. Of course the glass globe must be of highly refractory material, and the smaller its size the higher the efficiency. By way of comparison it may be said that ordinary incandescent lamps give from 150 to 200 c. p. per electrical H. P. of energy consumed; the arc lamp, from 500 to 100 c. p. The new lamp above described is said to have showed an efficiency of 888 c. p. per E. H. P. in tests recently made at Cornell. The advantages of the new lamp are its greater steadiness, pleasanter light (the intense glare of the ordinary arc lamp being done away with), and saving of carbons, the consumption of the positive carbon being only one to five per cent of the consumption in an ordinary arc lamp.

Cable Perforated by Grass.

The dangers to which underground wires in tropical countries are liable are illustrated by a picture which has been sent from India, says *Invention*. This picture shows a piece of rubber cable (Hooper's core) perforated by a root of grass, which still retains its vitality and thrives vigorously. It appears that the piece of core in question, after being treated with a composition which was supposed to make it proof against white ants, was buried, for a six-months test, unprotected by any armor, in soft, damp soil at Calcutta. On the piece of core being dug up the grass was found to have grown through it. What might appear an impossibility is explained by the statement that roots of the particular grass have very hard, sharp points, not unlike needles.

Small Telegraph Facilities.

In the whole of Peru there are, according to accounts, only 36 telegraph offices. In the territory of Paraguay there are only 510 miles of wire in operation, and the entire telegraphic service of that country gives employment to about 28 persons. One line of 360 miles, owned and operated by the Government, runs from Asuncion to Paso de Patria, the limit of Paraguayan territory, and the other 150 miles by the railroad from Asuncion to Pirape. Owing to high water and camp fires in that country the line is often interrupted for days at a time. In fact, Peru, Paraguay, Uruguay and Persia are said to be the four countries possessing the smallest facilities in the world.

Electric Boring Machine.

Another new application of electricity is that of boring or drilling into the earth. A new boring machine of this nature is now being tested in the new power house of the Broadway surface road at Fifteenth street and Sixth avenue, New York. In this house, according to the New York *World*, there is a brass cylinder, 22 feet long and about 5 inches in diameter, suspended vertically from the ceiling. At each end of the cylinder is a peculiar piece of mechanism. The whole is a new electric drill, which it is proposed to test by boring an artesian well 1500 feet deep in the boiler room of the power house. The mechanism at the lower end of the cylinder is the drill head, which is made to revolve by electricity. There are five powerful little motors in the cylinder above the drill head, which is armed with 22 black diamonds cast in solid steel plates. The motors can develop a force of 50-horse power, and cause the drills to revolve 2500 times a minute. There is a mechanism at the upper end of the drill by which it can be steered in any direction. The inventor says that by a cable attachment he can bore into the earth to any distance.

Useful Information.

Available Timber Supply.

The Division of Forestry of the Government Department of Agriculture, through its Chief, B. E. Fernow, is now disseminating valuable information relative to the timber supply of the United States. The value of the products derived from our forest resources, says the last report of Mr. Fernow, amounts to more than $1,000,000,000 annually, and as a single industry is only surpassed by agriculture itself. But that this vast industry sadly needs fostering care, intelligent attention and a close study of present demands and future needs and resources is proved by the vast consumption of timber in this country as compared with that of other countries where necessity has formulated and enforced protective laws. According to the census reports of 1890, the annual consumption of wood for all purposes has reached the enormous total of 22,000,000,000 cubic feet annually, or about 350 cubic feet per capita, as compared with 12 to 14 cubic feet per head in Great Britain and 40 cubic feet in Germany.

The largest amount of this consumption is for firewood, or about 280 cubic feet per capita; but this wood in the United States comes to a large extent from split body wood of the best class of trees, and not from the inferior material used for this purpose in older countries. The consumption of sawed wood products is over 40 cubic feet per head; and if to this is added hewn timber and wood used in railway construction, the total annual requirements for sizable timber will easily reach 50 cubic feet per head. To produce such amounts the annual growth of not less than 500,000,000 acres of well-managed forest in good condition would be necessary, and it would more than double this acreage to add the consumption in firewood, mining and fencing, for which we use body wood, hardly inferior to sawed timber. According to the most carefully compiled statistics, we now have only about 480,000,000 acres of forest area, and a large part of this is believed to be in a more or less devastated condition, owing to forest fires and general lack of care. We have, therefore, been using for some time more than our annual growth and are rapidly cutting into our inherited capital account. Even assuming the figure of a present annual consumption of 10,000,000,000 cubic feet, as claimed by some authorities, the supply would be exhausted in less than 100 years, for our consumption has increased at the rate of about 30 per cent in the last three decades.

A Mammoth Kite.

The largest kite ever made in the United States is that produced in Durham, Greene county, N. C. The frame consists of two main sticks 28 feet long, weighing 75 pounds each. All the sticks were 2x6 inches in dimensions. Over the framework was stretched a great sheet of white duck 25x18 feet, which weighed 55 pounds. The tail of the kite alone weighed 50 pounds and contained 155 yards of muslin. Twenty-five hundred feet of ½-inch rope served as kite strings. The plaything cost $100, and when it is mounted into the air it exerts a lifting power of 500 pounds. Six men once permitted it to ascend 1000 feet.

Pump With One Moving Part.

A new and simple pump with only one moving part, suitable for raising large bodies of water, as in the case of mines, has been invented by M. Dejean de Touroque, former pupil of the Paris School of Mines. A close chamber is formed below the level of water to be lifted, communicating with the surface by a pipe of about 5-inch diameter, which forms the raising main, and by another pipe for the introduction of air to supply the place of the water to be raised. The top of the chamber is also provided with a sliding valve which may be opened or closed from the surface. At the top of the raising main revolves a sleeve, with three curved and hollow arms like those of the Barker's mill, of which this invention is the converse. To start the pump the sliding valve of the chamber is closed, and the air pipe filled with water until it flows out at the arms. A rotary motion is then given to the latter, the sliding valve being opened, when the water flows from the arms in volume proportioned to the speed of their rotation. The weight of the revolving portion is taken by a footstep through the revolving spindle, where alone there is any friction, the joint at the sleeve being only tight enough to prevent escape of the water. Trials with this pump at Belves, in Dordogne, have shown that it is capable of raising a large volume of water with the expenditure of very small power, while there are no working valves to become clogged by obstructions.

The Guano of the Nile.

For quite two years at least a group of English financiers, in which there is a sprinkling of French blood, has been endeavoring to obtain, and has at last obtained, a perpetual concession for the collection and utilization of all that magnificent mass of what, for want of a better term, we will call guano, which is floated down the Nile, and has, during a long succession of centuries, assisted to build up and fertilize the Nile's verdant delta, says London *Money and Trade*. The putrid carcasses and waste of ten thousand habitations and all other things that the great river can gather up in its course, have been found, together with its sand, to make the most perfect manure—a manure, indeed, which surpasses even nitrate, for while this latter exhausts the ground after a few years, the "Nile guano" continues to enrich the soil year after year, the only possible disadvantage being that the soil might become too rich. This, however, can be easily avoided by the application of a little congenial saod. The excellence of the guano and the terms of the concession which has just be obtained, are such as suggest profit-making in the future.

How Scissors Are Made.

Though no complexities are involved in the making of scissors, yet the process is very interesting. They are forged, says an exchange, from good bar steel heated to redness, each blade being cut off with sufficient metal to form the shank, or that destined to become the cutting part of the bow, or that which later on is fashioned into the holding portion. For the bow a small hole is punched, and this is afterward expanded to the proper size by hammering it on a conical anvil, after which both shank and bow are filed into a more perfect shape, and the hole bored in the middle for the rivet.

The blades are next ground and the handles filed smooth and burnished with oil and

emery, after which the pairs are fitted together and tested as to their easy working. They are not finished, however. They have to undergo hardening and tempering and be again adjusted, after which they are finally put together again and polished for the third time. In comparing the edges of knives or scissors it will be noticed, of course, that the latter are not in any way so sharply ground as the former, and that in cutting, scissors crush and bruise more than knives.

A Simple Barometer.

A simple but effective barometer can be made, says a contemporary, by filling a common, wide-mouthed pickle bottle within three inches of the top with water; then taking an ordinary Floreoce oil flask, and, having removed the straw covering and washed it thoroughly, plungiog the neck of the flask as far as it will go into the pickle bottle, you have thus a complete barometer. In fioe weather the water will rise into the neck of the flask higher than the mouth of the pickle bottle; in wet and windy weather it will fall to within an inch of the mouth of the flask. Before a heavy gale of wind, at least eight hours before the gale reached its height, the water, has, it is said, been seen to leave the flask altogether.

New Kind of Motor.

Herr Diesel, engineer, Berlin, has according to the *Schlesisches Gewerbeblatt*, devised a new kind of motor. Atmospherlc air is suddenly compressed in a cylinder up to 90 atmospheres pressure. It is thereby greatly heated. At the moment the piston begins to returo, either coal dust or a combustible gas is let lnto the cylinder. It there takes fire, because the temperature is up to the kindling point. The force of the explosion due to this drives the machine. The motor would correspond, theoretically, to a very great advance, since the coal consumption per indicated horse power would be only 0.22 lb., and the dlmensions of the machine are considerably smaller than those of a steam engine of equal power.

The Largest Artesian Well.

Chamberlain, South Dakota, now enjoys the distinction of having within its limits the largest artesian well in the United States. Early dispatches placed the flow at 3000 gallons per minute, but since then the flow has increased, nntil on the evening of the 5th inst. it reached the enormous quantity of 8000 gallons per minute. The well is eight inches in diameter and the water is thrown to the height of over 14 feet above the top of the pipe. The only other well in the Uoited States which compares with the one at Chamberlain is at St. Augustine, Fla., which is 12 ioches in diameter, and flows at the rate of 7000 gallons per minute.

Gypsies and Religion.

Gypsies have no religion and some of them have so strong an aversion to churches that they never pass by one without a muttered curse. In European countries they never suffer themselves to be buried in a churchyard, but, whenever allowed, they bury their dead in out-of-the-way places. Their antipathy to churches and religious forms is supposed by some persons to have originated from their persecution by the priesthood in the middle ages, but, whatever its origin, it is a fixed fact.

Wild Hair.

A "wild hair" is the most annoying freak of nature a man can be afflicted with. It grows in from the eyelid instead of out, and constantly brushing against the eyeball, sometimes causes an irritation that results in loss of sight. To pull it out gives only temporary relief, since in a few weeks it comes back, as well grown and strong as ever. The only way to kill it is to destroy the sac from which it springs.

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.C. BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co. Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Orucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION — JUST OUT.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

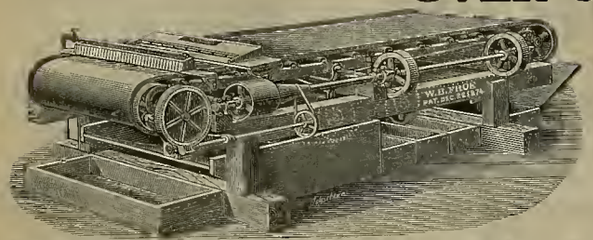
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

Price of 4-foot wide Plain Belt Frue Vanner.....$550, f. o. b.

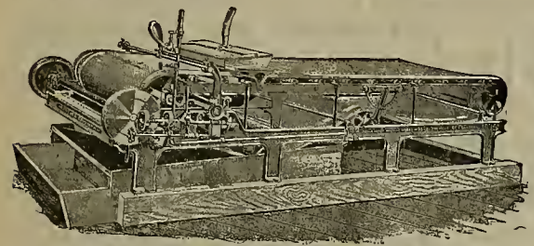
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.
No. 132 Market Street. - - San Francisco, Cal.

IMPROVED FORM OF "TRIUMPH" ORE CONCENTRATORS.



The annexed cut illustratee the **"TRIUMPH" CONCENTRATORS.** and showe the recent improvements which have been introduced into their conetruction, by which many advantages are gained over any other form of Vanners, Vanning Machines or Concentrators.

These advantages are obtained by reason of the fact, as will be observed, that the crank-shaft is now placed and fitted at the head of the Concentrator, clear of the belt and in direct view of the operator or attendant. This, of course, greatly facilitates the oiling of the bearings of the shaft and connecting rod and precludes the possibility of any sand or detritus, passing over the belt, from reaching or getting into the bearings.

The forms of the bearings and as well of the connecting-rod brasses have also been very much improved, making them stronger, simpler and more easy of adjustment. Important changes have also been made in the feed screw and quadrant for regulating the belt, with the view of making all parts of the machine stronger, more accessible and as easy of regulation as is possible.

We furnish the "TRIUMPH" Concentrators with either the plain or "Blasdel" Riffled Belt and shall be pleased to quote prices with the adaptation of either, as may be requested, and shall further be pleased to show one of the improved form, set up ready for operation, at our office.

REDDING, CAL., April 22, 1893.

Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco, Cal.—Gentlemen:—Following the testimonial letter which I addressed to you December 9th, 1890, in relation to the superiority of the "Triumph" Concentrators over either the "Frue" Vanners or "Woodbury" Concentrators for concentrating our Texas ores, I hold now to the opinion then expressed; and with nearly two years and a half further experience in their operation I can confidently assert and am more fully convinced than then, that the "Triumph" Concentrators are better in all respects than any other form for concentrating our Texas and Bully Choop ores, and in evidence of such confidence I refer with pleasure to the order recently placed with you for four (4) of the "IMPROVED TRIUMPHS," to make up the complement required for use in the new twenty (20) stamp mill at the "Cleveland Consolidated Mining Co.'s mines in Bully Choop Mining District in Shasta and Trinity Counties, this State, and I feel assured that the improvements lately introduced into their construction will make them even better than the old form which I have had in operation for so many years past in the different mills under my supervision. I am, very truly,

(Signed) R. G. HART, Sr., Manager Texas and Cleveland Cons. Mining Co's.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

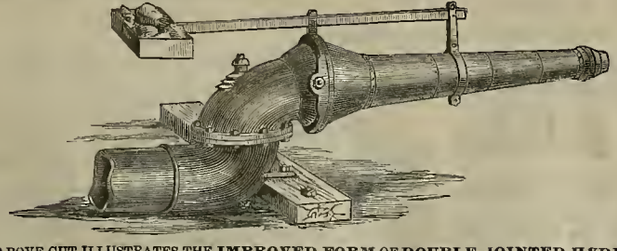
NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

—BUILT SOLELY BY THE—

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
SOUTH MILWAUKEE, WIS. U. S. A.

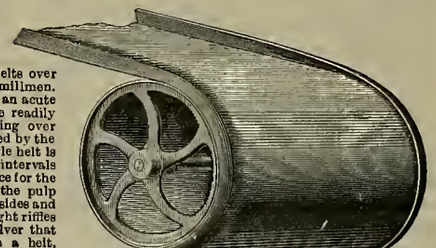
IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE **IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS** which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 51 Fremont St., San Francisco.

THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

Coast Industrial Notes.

—A big hotel nn the ocean beacb near San Francisco is projected.

—A new steel plant, utilizing a new process, is projected at Oakland.

—The San Francisco Sewer Commission has been abolished by the Board of Supervisors.

—The Coast Sailors' Union has volnntarily reduced the scale of wages from $40 to $35 per month.

—General Superintendent Gabel, of the Atlantic & Pacific, says the prospects of extension of the road to San Francisco are "very good."

—After the 15th inst. coal goes up at Victoria, according to published announcement, to $7 cash per ton.

—The Pacific Iron and Nail Works of Oakland which were destroyed about five weeks ago, are to be rebuilt immediately.

—It is said that the Southern Pacific has decided on a new bond issue of $89,000,000, part of which is to be expended on new lines.

—A survey corps is locating the the line nf the Monterey-Fresno railway between Hollister and Salinas. It is said construction will commence next month.

—The trustees of the Southern California Inebriate Asylum have rejected all bids for the construction of a new wing, owing to a change in plans, and will advertise for new.

—Designs have been accepted for the construction of a $1,000,000 building on the lot of the Parrot Estate, San Francisco, opposite the Baldwin Hotel, on Market street.

—The next earniugs of the Southern Pacific Railroad Company, Atlantic and Pacific systems, for the first six months of 1893 show an increase of $313,902 over the same period of 1892.

—The Pacific Insurance Union has appointed a committee to revise rates in Tulare, King, Fresno and Madera counties, and to add the three-fourths clause to all policies in those counties.

—The Oceanside bank, organized under the California State law, has been closed by order of the Bank Commissiouers. By good management the depositors, to whom was owed $28,000, will be paid in full.

—The report of the sale of the controlling interest in the San Diego cable railway to the Electric Storage Railway Company of San Francisco is confirmed by news that electric storage cars bave been shipped to San Diego.

—Judge John L. Campbell has sold his interest in the Lytle Creek water course to A. G. Hubbard, the Harqua Hala millionaire, for $45,000. The water is leased to the city of San Bernardino for a term of 20 years for an annual rental of about $4500.

—Sandford Fleming, a noted Canadian engineer, who laid an Atlantic cable, leaves by the Warrimoo Saturday for Australia, to lnquire into the feasibility and tbe probable cost of the construction of a cable from Australia to Vanconver, touching at Honolulu and other islands of the Pacific.

—Congressman Hilborn has lntroduced these blls: To provide an appropriation of $500.000 for a public building in Oakland and $100,000 for Alameda; also a bill providing for the construction of a revenue cutter to be used as a boardlng-vessel in San Francisco harbor, to cost $50,000.

—The Spokane Exposltion Building, an immense structure erected in 1890 at a cost of $100,000, was destroyed by fire Sunday. The building was owned by several business firms who held judgments against it. There was no insurance. It was an unprofitable investment, and will probably not be rebuilt.

—Major Heuer and bis corps of engineers have just completed a double cut-off in the San Joaquin river, near Stockton. This was done by cutting off two sharp bends in tbe river, and thereby straigbtening it at that point. Tbis will not only aid navlgation, but tend to protect the city of Stockton in the event of freshets.

—The newly-completed Spokane city hall was nearly destroyed by fire Wednesday, the foundation and first-story walls alone being saved. The jail and fire-station annex escaped with sllght damage. The building would have cost, complete, $100,000. The loss ls estimated at $40,000; insurance, $65,000. The origin of the fire is unknown.

—About two weeks ago the Union Transportation Co., wbich operates tbe opposition steamers between Stockton and San Francisco, asked all the crews of tbe Captain Weber and the Dauntless to accept a reduction of 10 per cent in wages. This reduction was to apply to all hands from the captain down to tbe waiters. The engineers and firemen have decided to decline the request.

—Fall fishing on the Columbia river began September 12th, when abont 200 boats went out to the fishing grounds to cast their nets. From all reports fish are running slack, and a poor season is looked for. Two canneries only, Kinney's and Hawtbnrn's, have opened up at Astoria, and tbe ruling price to fishermen has been fixed at 1¼ cents per pound, though it will probably rise to 3 cents before the season's close.

—The Southern Pacific Company proposes to compel payment of fares in Oakland. On each side of the cars a gate will be attached for the purpose of shutting out the non-paying citizens, and nobody will be permitted tn get on the cars unless he or she has a nickel. For this purpose ticket offices will be establlshed at each of the stopping-places, where passengers may secure the necessary pieces of pasteboard admitting them to the cars of the company.

—School Director Girard of Oakland has entered a vigorous protest because the work on the new school buildings in the city has not been commenced. No work has been done on the new schools in tbe Third and Seventh wards, which have been contracted for. Girard says that the money for these schools has been in the treasury 18 months, and the city has to pay interest on the bonds issued. He thinks it is high time to take action, so that the idle workingmen may have something to do.

—What may turn out to be a big war in rates between the Southern Pacific and the Santa Fe railway lines has been commenced. The Southern Pacific Company has notified its connections east and north that the southern California end of the Santa Fe system has made a cut of $4 on through tickets to the East and threatens still deeper cuts, and in view of this the Southern Pacific asks the lines with which it connects to share pro rata with lt in meeting the $4 cut, and others if they be made.

—A contract has been let by the Government to the San Francisco Bridge Company to cut off the more troublesome bends in the San Joaquin at Twenty-one-mile Slough, which will make the river straighter and greatly improve navigation. These cuts and others recently made near Stockton will shorten the distance to San Francisco two miles and make tidal action greater. The contract price for removing 200,000 yards and making tbe cut 24 feet wlde is at the rate of 9 cents a yard.

—Contracts bave been let at San Diego for the brickwork, plastering and decorating necessary in the restoratlon of the old Mission of San Luis Rey. The work involves an expenditure of $150,000. The contract fnr brickwork was awarded to Cornelius Kavanaugb of San Diego for $35,000. The work will commence Monday. The plastering contract was given to James McNear, also of San Diego, for $13,000. Most of the carpentering work is to be done by tbe Franciscan Fathers themselves, who are in charge of the mission.

—Active operations on the construction of the harbor jetty at San Diego will be commenced in about ten days. Workmen are now making lighters and stone boats at Russ wbarf, which will soon be ready. Lumber for the office has been forwarded to Nortb Island. The engineers, firemen and foremen of the various branches of work bave been already engaged. The track of the National City & Otay R. R. to Rock quarry in Sweetwater valley is being pushed and rock will be forwarded to the site of the jetty in a week more. The first 500 tons will go over the Coronado track.

—The directors of the Davie Ferry Company of Oakland have decided on tbe character of the two boats they intend to build for the Oakland creek route, and a handsome model in accordance with the plans bas been completed. It calls for a double-ended propeller 184 feet long by 31 beam, 12 depth and 10 draught, with a speed of 17 knots. Mr. Davie states tbat the vessels will be built under the supervision of J. J. Ebert, who is a part owner in the Rosalie. If the steamers realize the speed projected for them they will make the run to the foot of Broadway, Oakland, in 21 minutes.

—A settlement has at last been reached between Oakland and the Pacific Dredging Co. witb respect to the cost of dredging Lake Merritt for tbe boulevard. The City Engineer reported that the company bad dredged 57,966 cubic yards which bad been placed behind tbe boulevard retalnlng wall. He also reported that 20,600 cubic yards had been placed outside tbe wall. The question arose as to whether the company should be paid for the latter number of yards, wbich at 30 cents a yard would amount to $6180. The company abandoned its claim to the latter dredging, with tbe exception of about 7000 yards. A compromise was affected by which the company was given credit for 4000 of the 7000 yards. This amount added to 57,966 yards made a total of 61,966 yards, for which the bill, amounting to $8155.92, was rendered and allowed. The contract was then annulled and the bondsmen discharged.

—The statement of the Southern Pacific Company nf shipments fnr the week ending September 9, shows a heavy movement of Santa Clara county products to the eastern markets. The total sbipment aggregates 2,839 000 pounds, an increase of 1,000,000 pounds nver the corresponding week last year. This total is made up of the following items: Canned goods, 243,430 pounds: dried fruits, 1,232,875; green fruit, 1,749,555; wine and brandy, 54,999; leatber, 1,870. Shipments to San Francisco and California points amounted to 1,562,110 pounds, making the total sbipments, 4,401,110 pounds.

—The work of dredging the harbor in front of Oakland will be commenced in a few days by Captain Hackett. The work which is yet to be finished is the completion of the tidal canal, the buildlng of a bridge at High street, the extension of a south jetty, the dredging of the interior cbannels and the buildlng of a dam at San Leandro. To finisb the work it is estlmated that $841,000 will be required. Colonel Mendell, who is in charge of the work, says that it is impossible for him to determine when the people of Alameda may be gratified by the finishing of the tidal canal, as tbe matter depends upon the appropriation.

—A big contract for improving Seventeentb street, Sacramento, has been let to B. Labs at tbe following figures: Per cubic yard of earth, excavating, 5 cents; price per cubic yard of earth, scraper worker, 15 cents; price per cubic yard of earth, hauling from block to block, 30 cents; price per cubic yard of macadam, $3.50; price per square foot of rock gutter, 12 cents; price per lineal foot of new curbing, 12½ cents; price per round corner, $3; price per lineal foot setting granite crosswalks, 25 cents; price per lineal foot of old wood curbing, to be reset, 8 cents; price per apron, $2; price per catch basin, complete, $35; price per lineal foot of ironstone pipe, 35 cents.

—William Sproule, Assistant General Freight Agent of the Southern Pacific, reports that the shipments of deciduous fruits show an increase over those of last year. The figures are as follows:

GREEN FRUIT.	Season 1893. Carloads.	Season 1892. Carloads.
September 1st to 11th, inclusive	510	335
August 1et to 31st. inclusive.....	1,644	1,416
Season to date.....	3,612	2,766

Each carload is estimated to contain 11½ tons, which will give a total of over 41,000 tons of deciduous fruit sent East tbis season. The demand for fruit cars ls still great, and the aggregate shipments this year will be much greater than tbose of last season.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GENEEAL RESUME.—*Record*, Sept. 7: At the South Eureka mine a few men have been added to the working force during the past week. . . J. W. Traek has a gravel claim in Rancheria district that he tbinke deeerves some attention from mining men. He eaye the gold is coarse, that large amounts have been taken out in years past. It needs some capital to properly work it, hut not a great deal. . . J. H. Tibhite, enperintendent of the Alhany mine in Jackson, speaks very encouragingly of the future of that district. He eays that several new hoieting plants and deep shafte are now in view south of the famous Kennedy, and thinke several additional dividend payere will he added to the list in a ehort time. . . Preparations are being made and eupplies laid in preparatory to einking at the Pioneer mine. Thie property ie on the mother lode between the Kennedy and Alma minee. Another company ie being organized in San Francieco to operate an adjoining claim to the sonth of the Alma. On every hand the clang of preparatione for the opening of new mines is heing heard. . . Samuel Wearne, H. R. Camphell and H. Cook are the contractors at the Belmont mine. The Boss ehaft is drained to the 200 level and the north drift ie heing extended, in the face of which ehows good indications, and etringers of quartz are coming in whicb aesay fairly well. It is the intention of the company to put in a hoieting plant if the preeent drift opens np as well as expected. The shaft will also he sunk to a deeper level. . . Superintendent Kyle is doing all he can to hring the Quartz Mountain mine forward as a dividend payer. The mill and everything connected therewith is being put in first-class order eo as to work the ore ae cheaply as possible. The rock eo far has heen of a low grade, hut it is helieved that it can be made to pay. There is a 15-foot ledge at present in their tunnel, eix feet of wbich is fair milling ore. The balance of the vein is epotted, showing coneiderable enlphnrets. but little free gold. . . Soperintendent John Myers of the Bunker Hill mine reporte that they have 200 tons of fair grade milling ore on the dump, all of which was taken from the 350 level of the Mayflower ehaft. There are two ledges in sight, one ehowing a width of 14 feet and the other of ahont eix feet, the narrower ledge assaying the heet. The new tramway is completed and a general overhanling of the mill machiuery is taking place. It is expected that the stampe will he dropped by Thursday of next week. Superintendent Myers eays that when mattere are all in good working order be expecte to be able to mine and mill tbe ore at a cost of not over $2 a ton. Tbis ehonld leave a fair margin for profit even though tbe ore continues to he of low grade. They are now employing 15 men, hut thie force will he added to coneiderably in the near futnre.

Butte.

A GOOD CLEAN-UP.—Oroville *Mercury*, Sept. 11: Wm. Eogland, the owner of the rich qnartz ledge, was over from Bangor on Friday and brought with him over $3000 in gold which be ponnded ont in a hand mortar during the paet few weeks. It was sbipped tbrongh the Bank of Rideout, Smith & Co. to the mint at San Francieco. Mr. England will cease operatione for the winter, heing contented with the reenlt of hie last few weeks' work. The ledge ie two feet wide and of marveloue richuees.

Nevada.

THE GOON HOPE.—*Tidings*, Sept. 5: William Paecoe, president of the Good Hope Mining Company, and Wm. Eddy, one of tbe principal ownere, are up from their mine near Cahbage Patch. The gentlemen report that everything is looking fine in their vicinity. The company now have their four-etamp mill engaged in crushing ore, which ie yielding handsomely. The ebaft is now down ahont 100 feet and the ledge holds good. They are now engsged in eorting ont eome ore to eend to the Selby Smelting Works, all of which will pay $200 per ton aud over. Several San Francieco capitaliets have recently examined the mine and bave become etockboldere in the company, who intend eoon to begin the einking of a new three-department shaft on the ground. The four-stamp mill has been found inadeqnate and a new ten-stamp mill with all modern improvemente will eoon take ite place.

THE REWAEN.—*Herald*: Gen. S. W. Backus, Col. Wm. Macdonald, Col. R. D. Laidlaw, Sam K. Thornton and Edward C. Sntcliffe, San Francisco capitaliste, who are owners of the Reward mine, arrived in Nevada City on Satnrday morning to inepect the property. They were joined tbere hy Dan Cole, preeident of the company, and Meesrs. Thomae and Walrath took the party ont to the mine. The Reward, for a new enterpriee, is a "hoomer." It hae heen opened during the paet eix months, and is yet a proepect, hut such a proepect as will gladden the bearte of the friends of mining. The ledge now averagee from one to two feet in width, and the rock aseaye, by mill procese, over $100 a ton. It is the eonth extension of the Gold Tunnel and California ledges, which were once the richeet mines in thie district.

NEW MILL.—*Telegraph*, Sept. 2: W. C. D. Body will leave Monday for Iowa Hill, where he will build a mill for the Morning Star Gravel-Mining Company. The old mill will he torn down. He will have the mill completed in ahont eix weeks.

CHANNEL STRUCK.—*Tidings*: Jamee Pollard, at Yuha river, with James Vineyard, T. C. Bourne and D. E. Matteson, ie working gravel diggings. A rich channel hae heen etruck that yielde $10 to the pan. This channel was fonnd at a deptb of 15 feet. The company intends to work the river bed.

ANOTHEE MINE.—*Tidings*: Joeepb Powning of the Orleans Mining Company has organized a company of New York and San Francisco capitaliete to work the New Orleane claim on Madieon Hill, adjoining the Empire mine. Work will he commenced next week, and a new two-compartment incline ehaft will he sunk. Machinery eufficient to work the mine to a depth of 1000 feet will he erected nnder the enpervision of Joe. Bennallack. The location is a most favorahle one, and it is to he hoped that a paying mine will he developed. A ten-stamp mill will he erected on the ground in a ehort time, and it is expected to have everything in working order before winter sets in.

MINING GROUND BONDED.—*Tidings*: The Baltic Mining Company has bonded the Smith claim, adjoining the old Butler orchard, and lately eix men were put to work on the claim. There is a well-developed quartz ledge on the ground, and it is the intention of the company to extract eeveral tone of the ore, which will be crnehed in the Baltic mill ehould the enpply of quartz at the Baltic at any time run short. The Baltic Company has bonded the claim for a period of three yeare, and it is the intention of the company to eecure as much adjoining ground ae possihle. The mine ie looking firet-rate at present, and the work is heing rapidly pnshed forward.

THE DAM OVERFLOWED.—Grass Valley *Union*, Sept. 13: A numher of men employed hy tbe Yuha River Mining Company were in town yesterday. They will he idle for several days on acconnt of the dam which turne the water from the workinge overflowing and filling the hole with water. It will take eeveral days hefore the water can he pnmped ont and work reeumed on the river hed. Some very rich gravel hae heen taken out of theee workings recently, and the managere are confident that

if the rains hold off long enough they will make a handsome cleanup.

RUMORED MINING DEAL.—*Union*, Sept. 13: It was rumored on the streets last evening that James D. Hague, the well-known mining man of New York, now in this city, had purchased the bulk of the stock in the Stockbridge mine, and will proceed immediately to open and develop the same. The Stockbridge is situated near the Rocky Bar and is known to be located on good ground.

THE ST. JOHN.—*Union*, Sept. 13: A good-sized stream of water was struck in the lower level of the St. John mine early Tuesday morning. This is a good indication and denotes that the ledge is near at hand. The miners have been working in good-looking rock for some time, but are of the opinion that the real ledge has not yet been discovered. They expect to strike the main ledge in a few days, and then some very rich ore may be looked for.

THE GRANITE.—*Union*, Sept. 13: Supt. Fowler last evening informed a *Union* reporter that pumping at the Granite Hill had commenced, and that they expect to "see bottom" in 10 or 12 days more, when active work will be commenced. Joseph Everett will shortly erect a new water wheel on the mine for hoisting purposes, and the wheel now there will be used for pumping only.

Placer.

THE MOORE.—Placer *Herald*, Sept. 9: T. M. Tharp, one of the owners in the Moors quartz mine located a mile or two below Auburn, informs us that their ledge, which yielded about $40,000 from a shaft on it 300 feet deep, continues to show new merit with each additional development. At a depth of 100 feet, they run a level in 80 feet and found rich rock all the way. They are now running in on the 180-foot level, and the ore is even richer than it was nearer the surface. All the rock is of a high grade for milling, and in many places it is rich enough for specimens. On the forenoon of Saturday they uncovered a rich body of ore and took out before dinner that day at least $1000.

THROUGH HARD ROCK.—Towles Cor. *Argus*: Rodger & Co. have passed through the 60 feet of extremely hard rock in their bedrock tunnel near Shady Run. This hard stratum has required three months hard work. They expect to advance faster now and reach the channel within 200 feet from the present point.

Plumas.

NATIVE COPPER.—*National Bulletin*: We have received from A. M. Gee of Taylorville a very rich and handsome specimen of native copper from the latter's mine in Mountain Meadows. The ledge is about two feet wide, and the ore is literally tied together with native copper.

San Bernardino.

PLACER DEPOSITS.—John Metcalf brings the news from Bear valley that rich placer claims have been discovered near the Bear Valley dam on timber land owned by T. J. Wilson, deputy county assessor, going 20 cents to the pan. Many claims have been staked out and a number of miners are hard at work on the new discovery. The Valley Gold Company of Halcomb valley are putting in a steam shovel to handle the dirt, and are preparing to work their claims on an extensive scale.

Shasta.

ACTIVE WORK ON MINES.—*Courier*, Sept. 9: Ten of the 20 stamps at Bullychoop began pounding rock Monday. Mr. Hart is getting things in running shape and everything will hum soon. The cyanide process has proven a fizzle at Bullychoop, as it did at the Gladstone and it is the intention to erect an extensive chlorinating plant there soon. Marley and Jaegel are making a big success out of their new works at South Fork and expect to turn out bullion at a lively rate. The McMahan works are also making a success working the ores of that camp. The works are under the supervision of Frank Satterlee and Mr. Reed. E. Ballou has his South Fork milling works in operation and is working ores from his mines. Whit George struck a fine prospect in his new ledge at Muletown, and is driving away with good chances of uncovering a rich vein. The ledge runs parallel with the old Potosi owned by Senator Jones. H. J. Bunnell intends to run a 300-foot tunnel on his ledge on Muletown mountain near the Potosi, to drain the mine. The water and bad air have stopped work in the shaft and caused considerable expense. The tunnel will tap the vein 50 feet deeper. The New Year, owned by L. Garrecht and others of Shasta, is developing into a great mine and we should not be surprised to see a second Mammoth here on the West Side. Garrecht showed us samples of rock picked up at random on the dump, which were rich with gold. They also contained sulphurets of high grade. Garrecht also showed us a pill box full of fine gold panned from a shovel full of dirt and quartz from the shaft. The owners are prospecting and developing the mine and have a five-foot vein in the bottom of the shaft. Jim Hill showed the *Courier* some great specimens taken from the dump and shaft of his mine on the road below Lower Springs, that to look at would cure sore eyes. All of the rock was sprinkled with gold. He also showed us rock taken out after the last shot, which was wired and hung together with gold, the "ore" sticking out in chunks. The ledge is 2½ feet wide. The shaft near the road is down about 30 feet. The mine is near the White Oak, and is one of the most promising mines of the camp. Milt Cunningham and Burt Wiser are interested in the mine. Hart's is the only mill running along the river just at present and the ore buckets come down from the mine in endless procession laden with ore to feed the thundering stamps. The mine is one of the best bullion producers in Old Diggings. The Hidden Treasure mill was to start up this week. Supt. Kermeen has moved the old 10-stamp Mad Ox mill to the mine. They have some good ore on the dump. Simoni has advanced his tunnel in 300 feet in hard rock. He will run in 800 feet and if it reveals what is expected the 10-stamp mill will be moved down on the creek. Hull, Murray and Conroy are in about 150 feet on their promising mine on the divide north of Shasta. Mining experts declare it is going to develop into one of the best mines in the State. They have a body of ore now nine feet wide which assays $5 to $1500 per ton. Mining men from below are up inspecting the property. Work has been resumed on the Minnesota or Levi mine on the north side of Spring creek about six miles from Shasta. The Minnesota is beyond doubt a great mine. Dissensions among the former owners have kept the mine tied up for some time, but we understand the new company intend to put up a 10-stamp mill to supplant the old dry process works put in by Parmlee, and work the mine in earnest. The tunnel is in about 800 feet, showing an immense amount of milling ore. The ledge varies from five to nine feet wide being about the latter width at the breast of the tunnel. The Gladstone management are rapidly getting their new chlorinating works in working order, and load after load of machinery has gone up to the mine. The company purchased a 10-stamp mill in Idaho some time ago and are putting it up at the mine. The Uncle Sam's 30 stamps are still thundering away pounding out the "yaller stuff." The Uncle Sam is the boss bullion producing mine of northern California, and Supt. James is increasing the capacity of the mill. A Huntington mill from Sierra is to be put at the Uncle Sam which will be equal to ten additional stamps. They have ore enough in sight to run the mill ten years. Jim Dawe is working a small force of men on his mine near Shasta. He is in 40 feet on the vein and has run a 76-foot crosscut, and is opening the mine for the inspection of capitalists. Some exceedingly rich galena ore was struck in the mine lately. The Flat creek and Copley country is beginning to wake up a little. They have some good mines there but no capital is "what's the matter." Around Italian John's place are several promising claims. Dan McCarty owns a ledge there that is mighty liable to develop into a bonanza, judging from samples taken from it. Mr. McCarty has until lately been working some men on his mine. Chas. Thistlethwaite, who owns claims near by has been talking of putting up a mill. Mr. Fitch, who purchased the Drury mine is expected up soon to see about the mill, which they intend to put up here.

PAYMENT ON MINE.—*Democrat:* Representatives of the Chicago company who have purchased the Quartz Hill mine from T. J. Harrison, Steve Meeks and Bob Lyons, were here last week and on Friday made a $10,000 payment on the deal, and will pay the balance in six and nine months. This mine sold for $36,000, which gives the former owners, who have stuck to it for so many years, a handsome stake. Quartz Hill is an enormous body of milling ore, with high-grade streaks. The new company will spend considerable money developing it, and will ultimately erect a large stamp-mill on the property.

THE INTEGRAL.—*Democrat*, Sept. 6: A. B. McCaw, president of the Integral Quicksilver Mining Company, says the company's property is developing wonderfully, and regular shipments of quicksilver are now being made. The company has five miles square of patented ground, including three whole sections they purchased from the railroad company, for which they have a government patent as well. This company is destined to develop into the most extensive quicksilver producing property on the Pacific Coast. Their patented claims completely surround the ground owned by the old Altoona Company, which has been in litigation for almost 20 years. The Integral Company is a rich syndicate and possessed of the means to develop this extensive quicksilver lode.

A FINE PROSPECT.—Jim Hill and Young Wiser's claim on the old Shasta road, this side of Lower Springs, is opening very encouragingly. The shaft is now down about 25 feet alongside the road. They have a well-defined vein 2½ feet wide, and on the footwall there is hand mortar rock, some of which hangs together by strings of gold. The remainder of the ledge is good milling ore. It certainly is a fine prospect.

AT FLAT CREEK.—*Courier*: There is much life in mining matters on Flat creek. The Minnesota people have quite a force of men at work, and are preparing to put in their ten-stamp mill. H. L. Shannon is pushing work on his property. He expects to have his mill running in a few weeks.

Siskiyou.

DOWN TO BEDROCK.—Yreka *Journal*, Sept. 13: The miners are getting down to bedrock at the American Bar mine, Klamath river, below Hornbrook, or about eight miles from Yreka in an air line, having struck the rim. The claim is now yielding about $225 a week, enough to pay working expenses; but very rich pay is expected when the bed of the channel is reached, where the bulk of the gold is generally found. . . The gravel at present taken out of the Greenhorn mine, about a mile south of Yreka, is yielding good returns, and the prospects indicate a still better yield as work progresses, and a better supply of water is obtained during the winter months for putting a larger force of men at work. . . The Schroeder quartz mine on Deadwood mountain, in McAdams' Creek mining district, is still paying handsomely, with operations continued day and night. The clean-ups are made every three or four weeks, and the results appear very satisfactory to Mr. J. H. Schroeder, the enterprising owner. . . The quartz mines at Butteville district on the head of Shasta river, west of Igerna, still continue to prospect well as the work of sinking down progresses. Dale & Kiernan's ledge shows a width of two feet all the way down as far as the shaft has been sunk, with the quartz increasing in richness the deeper they sink. This camp is destined to prove one of the best quartz mining districts in Siskiyou county. . . Parties have been inspecting the old Spencer quartz mining claim on Humbug, and are now in San Francisco organizing a company to work it. This claim has been one of the best paying mines in the Humbug Creek district, and will no doubt turn out well again if worked in a scientific manner. . . Gould is busily engaged in getting out quartz from the Hegler & Aldrich quartz mine on Humbug, which he has bonded for a company below, and finds very good prospects to indicate a purchase within the time stipulated. . . The Boyle quartz mine, on the head of the North Fork of Humbug creek, is now being worked constantly with good success, and will no doubt yield average clean-ups this season as any former year, or probably better, as there has been a better supply of water than usual.

Yuba.

MINES IN EMBRYO. — Marysville *Democrat*, Sept. 12: Many times the *Democrat* has directed attention to the almost positive indications of wealth existing in the quartz veins and lodes that are to be found in the upper part of this county. This writer has, during the past 30 years, had occasion to visit every section, traveling from place to place over every road where teams can go in safety, and during such trips has taken notes and made examination of mines, mining and many prospect places, during a recent visit to Camptonville and other points inquiry was made of several settlers who have resided in that part of the country many years, and they report considerable activity in prospecting and developing quartz lodes. The surface of the earth in many places contains quartz, gravel and float rock bearing indications of mineral, and in some cases free gold. Near Camptonville, where the surfaces has been washed away and where the bedrock is exposed, there are numerous small veins of quartz to be seen, and almost invariably their course is the same. The gold taken from these mines by washing the earth was of the class known to exist in decomposed quartz, and in many cases the precious metal was found attached to quartz rock. One quartz lode, which is well defined, is now being prospected a short distance from town above the flat, where millions have been extracted by the surface and hydraulic process, and there is every indication that the owners will in time be rewarded for the labor and expense. Another one is well developed that is called the "Honeycomb," and there is no longer a doubt of its being good property. One other company, which has had some troubles to contend with in raising the water, is about to commence work on a tunnel at the base of the hill on the south, and will run it until the lode is reached, at a depth of nearly 400 feet. This will not only drain the present works, but will be the means of developing one or more lodes, as it will pass through grounds where veins of quartz are numerous. There are many indications of wealth in these places, and it seems strange that they have not received attention by prospectors long ago, when the expenditure of a few dollars and a little labor may bring them a bonanza.

NEVADA.

Washoe District.

COMSTOCK OPERATIONS.— The Consolidated California & Virginia mine continues to yield the usual amount of good ore. That extracted during the week ending September 9th included 28 tons, assaying $27 per ton, from narrow streaks that are being followed 75 feet above the sill floor of the 1500 level, and 406 tons, assaying $34.58 per ton, from openings 52 feet below the 1650-foot level. A total of 477 tons of ore, averaging $34.58 per car-sample assay, was shipped to the Morgan mill. The amount of ore milled during the week was 400 tons, and the average battery assay of the same was $28.43 per ton. A few miners are being kept at work in the Ophir, Mexican, Union Consolidated, Sierra Nevada, Best & Belcher and Gould & Curry mines. There are no changes in the condition of these mines. In the Hale & Norcross mine, on the 1300 level, the new winze was sunk nine feet during the week; total depth, 17 feet. The superintendent reports that this winze continues all in ore of very good quality. There was extracted from the winze last week 37 cars of ore, the average assay of which was $45.15 per ton. In the Potosi mine the west crosscut from the south drift, 220 feet south of the shaft, 850 level, is out 26 feet; face in porphyry; have been making some repairs to the south drift during the week. The south drift on the 16th floor, above the 900 level, was advanced 18 feet during the week; total length, 36 feet; face in ledge matter containing occasional bunches of good ore. The south drift from the east crosscut, 73 feet above the 930 level, is out 30 feet; face in porphyry and low-grade quartz. Extracted and sent to the mill the past week 319 tons and 700 pounds of ore from the 1000 and 1150 levels; milled during the week 360 tons; on hand at mill 92 tons and 1400 pounds; average battery assays, $23.74; average car-sample assay, $23.77. Shipped to United States Mint, Carson, 648 pounds of crude bullion. During the week the usual prospecting was continued in the Yellow Jacket mine and about 20 tons of fair-grade ore taken daily from the 300 and 1100 levels. Thursday night seven men were drafted from the mine, leaving but four working underground.

ARIZONA.

ACTIVITY IN NEW DISTRICT.—Hugh McCrum, who has been making his headquarters at Prescott and is mining about 22 miles from there, the other day told a *Chronicle* reporter that his location is in the chaparral district, on the eastern slope of the Bradshaw mountains, on the Black Canyon stage road toward Phœnix. This is a new district in Yavapai county, and Mr. McCrum says that a number of Colorado men and others have lately located and bought claims there, and that it gives abundant promise of becoming one of the richest districts in the West. The mines in which he is largely interested are those of the McCrum Stamping and Milling Company. His has a Huntington mill at work, which he took down several months ago, and says the property is turning out very satisfactorily. Charles M. Clark, a well-known coast mining man, is the manager. "I never saw a district turn out better," said he, "and I have frequently visited all the mining camps of the Pacific Coast in all stages of development. Gold is found almost everywhere there, and in most of the claims now being worked a handsome profit is resulting to the owners. John S. Jones, who is in Chaparral gulch near me, has a five-stamp mill going and his property is proving exceedingly rich. He cleaned up a little short of $5000 in 14 days recently. Judge Wells, McCabe, Parsons and others have about completed a new mill a mile and a half distant from my works. Several other mills will be constructed soon. A large number of prospects have recently been opened and they have all proved to be rich. I look for a big crowd of people in the district. You have no idea how many men from the Rocky mountains hitherto engaged in silver mining are now investing there and elsewhere in Arizona in gold properties. Everybody wants gold mines and nobody wants silver.

FROM THE HASSAYAMPA.—*Journal-Miner*, Sept. 6: Judge Abner Wade came in yesterday from his King Solomon mine on the Hassayampa. He says that with all the rainfall which has occurred throughout the country he has not been able to secure sufficient water to start up his mill yet. He has everything in readiness to start up just as soon as a water supply can be obtained. Connor & Munkittrick have a lot of ore ready for shipment from their Ajax mine in Eureka district. W. O. O'Neill yesterday made a shipment of a block of onyx weighing 4670 pounds. It was shipped to New York. A $4000 bar of gold bullion was shipped, a few days since, from the Yarnell mine. There are between 50 and 60 men employed now in this camp. Hugh McCrumm came in from his camp at the Silver Belt on Saturday evening on his way to San Francisco. He had quite a respectable-sized bar of gold bullion with him, the result of a recent clean-up of his mill. Mr. McCrumm announced that he had quit purchasing ore. He has recently taken a bond on five claims belonging to Tifton & Lang, and on four belonging to Henry Lang—nine claims in all—and expects to be able to get more than enough ore from them to keep his mill running all the time. During his brief absence his mill will be in charge of Mr. Johndrew who will work a lot of ore in it from his own claims. Mr. McCrumm has shown great enterprise in his mining operations, and he is assured of success. If this section of Arizona had a few more men of his pluck and enterprise, such an era of prosperity would be inaugurated as has not been dreamed of.

COPPER WORKS TO RUN.—*Silver Belt*, Sept. 2: The recent meeting between Supt. Berray of the Old Dominion Copper Co. and employes was for the purpose of announcing a reduction of wages, made necessary by the heavy decline in the price of copper Mr. Berray stated, in a few words, that the company proposed a reduction of 25 cents in the wages of men who had been receiving $3.25, and that the pay of all those receiving more than $3.25 would be cut ten per cent. If the men accepted the reduction, more coke would be ordered and work continued. If not, the supply of coke on hand would be used up and the works closed down. It required only a few minutes for the men to arrive at a decision. They took the sensible view of the situation, and announced that they would go to work, realizing the prostration of mining everywhere throughout the West, and the difficulty of procuring work. Since last week there has been a further decline in copper (to $9.40@9.50 for Lake), but it is not likely to change the determination of the Old Dominion Company, as it is semi-officially reported that operations here will continue regardless of any fluctuations likely to occur in the price of copper. There are at this writing over 800,000 pounds of coke between Willcox and Globe.

IDAHO.

MINE LEASED.—Wardner *News*, Sept. 2: The Stemwinder mine has been leased to Messrs. Hughes, Sullivan, Glass and Dorsey. They commence operation to-day with a force of ten men, which will shortly be increased. The lessees extract the ore and load the tramway; the owners of the mine will mill the product.

NEW MEXICO.

PROSPECTING FOR GOLD.—*Southwest Sentinel*, Sept. 5: There are quite a number of prospectors out in the Burro mountains looking for gold. There is gold in nearly all of the gulches in that part of the county and some of the lucky prospectors may find a ledge which will make the Burros a big gold camp. The Pacific Gold Company is doing nothing at Pinos Altos but keeping the water pumped out of the mine. This looks as though the company did not intend to abandon the mine, but aside from this there is nothing to indicate whether the company intends to resume work or not. If lead continues to advance in price as it has during the past few weeks it will not be long before the mines at Cook's Peak will be in operation again. There are thousands of tons of lead ores exposed in the mines there and enough development work has been done at the camp to make it possible to work several hundred miners there to advantage. A fair price for lead means lively times for Cook's Peak. Some time ago it was reported that the Manhattan Gold Mining and Milling Company and the

Pacific Gold Company had agreed to pipe water to Pinos Altos and move the mills from this place to the mines there. No confirmation of the report can be obtained and it is more than probable that no such arrangement has been made. The cost of the undertaking would be great but the companies would save the entire amount in freight on ore within a year. It would be the best investment ever made by mioing companies in the Pinos Altos district. There will not be much work done in the silver mines in Grant county during the rest of this year. There is no prospect of a materially higher price for silver and the mines cannot be worked with silver at the present figures. Some silver will be produced from mines which produce gold principally and some of the richest silver mines will be worked on a small scale. Mine-owners generally do not consider it good policy to work out their mines and make little or no profit on the ore mined. They prefer to let the mines remain idle and trust to future legislation for better prices for the product of the silver mines. Hundreds of men would now be employed in the silver mines of this county if a dollar an ounce could be obtained for silver, but as it is, many of the men who have been employed in the silver mines will leave the country. The Montana tunnel is now in 790 feet and there are indications that the ground will get easier to work in a few feet more. It is thought that the vein will be reached before the expiration of the present contract which is to complete 829 feet of the tunnel. The tunnel is now considerably longer than the estimated distance to the vein when the work was commenced. The tunnel is perfectly dry, the water which was struck some months ago in it having completely dried up, and the water to supply the boiler has to be obtained from the Pacific mine. When water was first struck in the Montana tunnel it was thought that the flow might become sufficient to supply a mill if the water should be allowed to settle after it had been once used and then pumped back and used over again, but the prospect of a water supply from the tunnel is not very good now.

OREGON.

Bushel of Nuggets.—Baker City *Democrat*, Sept. 4: One of the most remarkable placer gold products seen in this city for some time is on exhibition at the First National Bank; remarkable from the coarseness of the gold and the numerous nuggets. The clean-up is from the Elk Creek diggings, near Susanville, Grant county, owned by Horace W. Sloan and N. C. Haskell, and amounts to a little over $5000. In one tray was shown gold nuggets of all sizes and shapes, the largest weighing $375; another $142.50, and a third $113.75, and many weighing from $30 to $40. This neat product of gold is from a strip of ground worked during the past 30 days which measures 65 feet wide, 145 feet long, and with an average depth of about 15 feet. The process of working is by hydraulic, and a steam derrick is used for the handling of the heavy bowlders that are encountered. These diggings have been worked many years by Messrs. Sloan and Haskell, but this season's clean-ups have been larger than ever, and the $375 nugget now on display at the bank is the largest ever found in the claims. The operation of these placers will continue for several weeks yet this season, ths water supply holding out beyond all expectations.

To Develop the Pyx.—Baker City *Democrat*, Sept. 4: One of the valuable gold properties of the Robinsonville district is the Pyx mine, discovered about three years ago and owned by Messrs. Cal. Berry and Chas. Collier. This property has been considerably developed, and such a showing has been made as to attract capital toward it. A few weeks ago Messrs. Berry and Collier bonded the property to some Montana capitalists, and arrangements are now being perfected to develop the property in a scientific manner. Hoisting machinery has arrived at the mine and is being put in place. The holders of the bond on ths property are to sink a deep shaft and at a certain depth run a shaft 100 feet each way on the vein. This done, they are to take the property at an agreed consideration or forfeit all development work. The Pyx is said to be a fine showing, and there is little doubt of its development into a permanent ore-producer.

Cleaning Up.—Jacksonville *Times*, Sept. 9: The Sterling Mining Co. is engaged in cleaning up, and the prospects for a good yield are excellent. The Ashland Mining Co. has suspended operations with its Burleigh drill until water becomes more plentiful, after having progressed 250 feet. The Jacksonville Mining and Milling Co. will hold a meeting on the 15th inst., to decide what they will do in the future. A ledge has been struck, but of what value and extent its future developments must decide. A. W. Stnrgis, of Jackass district, who owns one of the best placer mines in the State, has done well during the past season. The gold cleaned up was sold at Beekman & Reames' bank and amounted to about $17,000. Mr. Stnrgis is still engaged in cleaning up the work done with the hydraulic last winter and spring.

UTAH.

Rich Silver Find.—Park City *Record*, Sept. 9: Morris Dusseldorf, superintendent of the Comstock mine, located in Thaynes' canyon, came into the *Record* office Tuesday morning and displayed a cigar box full of ore, the looks of which would cure the sore eyes if silver was only what it should be. It is really fine ore, and an assay certificate shows it to run over 280 ounces in silver and $11.28 in gold. Mr. Dusseldorf says the ore is from a vein crossed in the old workings of the property but which was never followed. He has had several men at work for some time opening up the vein, and to-day in the bottom of the drift run on the same, the vein shows a width of nearly four feet and is loaded with clean ore, there being very little waste. He feels highly encouraged and thinks the Comstock company, which has recently been reorganized and placed on a strong footing, is in a fair way to open up another bonanza like the Crescent was in its earliest days, and is positive that the vein he has opened up will prove strong and go to the deep. The Ontario Company shipped this week 41 bars of bullion containing 22,960.14 fine ounces of silver. It is learned through Mr. Daly that only a force of six men are employed at the Daly West, and that work is being confined to sinking a winze on the vein. No ore is being hoisted and no steam has been raised in the boilers of the Daly West plant, and the old Daly No. 2 shaft is being used by the men in going to and returning from work. The machinery is being overhauled and the timbers in some parts of the mine repaired. No definite policy for the future has yet been decided on. W. S. Tolles and C. H. Gitsch left on Tuesday last for a several days' prospecting trip to the headwaters of the Bear river. Mr. Gitsch was over in that section some ten years ago, and in the short time he had at his disposal then he found enough indications of gold to convince him that the precious metal could be found in paying quantities if thorough prospecting could be done. Sec and James Snyder and Henry Staoley, fully equipped for a six weeks' trip in the mountains, left Tuesday last for a prospecting trip into the northeast corner of the Territory. The boys have some information concerning rich float found in that section, and are going to make a thorough investigation. Another party, headed by Martin McGrath, are making preparations to take the trail for nearly the same part of the country, and gold is the loadstone that attracts them. If there is any gold in that country, and many believe there is, it should be found before the storms of winter come on, for several of the parties looking for it are determined and experienced men, and hardly know what it is to lose hope.

Market Reports.

The Markets.

San Francisco, Sept. 14, 1893.

The silver market during the week has maintained an even tone, though sellers have been disposed to increase their asking prices. The range of quotations has been very small. Last Monday there were offered for sale to the Treasury Department 236,000 ounces of silver at .754 to .76, and of the amount 11,000 ounces were accepted at .754.

The Metals.

The recent feature of the metal market has been the rise of lead. The quotation was recently $3.20, but it has now advanced to $3.90, and the market is reported very firm. The point at which lead-silver mines may be operated at a profit has been passed, and there is a movement among them to resume operations. Copper is still very low. Tin is much stronger than recently, quotations having advanced in less than two weeks from $19.30 to $20.20.

Coins of 1893.

The face value of the coins made at the United States Mints in August and for the first eight months of the calendar year will be found annexed:

	For August.	Jan. 1 to Aug. 31.
Double Eagles	$2,500,000	$12,798,760
Eagles	1,287,400	6,219,620
Half Eagles	573,400	1,963,520
Quarter Eagles	.....	75,132
Standard Dollars	.....	1,455,465
Half Dollars	504,000	1,039,738
Half (Columbian) Dollars	.....	2,928,052
Quarter Dollars	133,000	1,691,550
Quarter (Columbian) Dols	.....	10,008
Dimes	87,000	507,046
Five Cents	84,900	465,363
Cents	20,900	302,213
Total	$5,120,600	$28,554,380
In 1892	4,427,020	34,241,432

Most of the decrease for the year has been in Eagles, Half Eagles and Standard Dollars.

Silver and the Metals.

New York, Sept. 14.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.	Copper.	Lead.	Tin.
Thursday	34	73⅝	9 62½	3 85	19 80
Friday	34¼	74⅛	9 62½	3 85	19 80
Saturday	34⅛	74⅞	9 62½	3 85	19 80
Monday	34⅛	74⅞	9 62½	3 90	20 10
Tuesday	34⅛	74¾	9 62½	3 90	20 10
Wednesday	34¼	74¾	9 62½	3 90	20 20

The Stock Market.

San Francisco, Sept. 14, 1893.

Pending settlement of the wage dispute on the Comstock the mining share market is exceedingly dull. Besides, business was interrupted during the week by the occurrence of Admission Day and of a Hebrew holiday Monday. At its regular morning session Friday, for the first time in the history of the San Francisco Stock and Exchange Board, not a sale of Comstock shares was made. The bidding prices, however, indicated that the market had a steady tone.

For the month of August the Consolidated California & Virginia mine made about $14,000 over and above its expenses, and has a surplus in the treasury of about $57,000. Regular shipments of ore to the Morgan mill will be made all this month, and good results are also expected.

Potosi has levied an assessment of 25 cents per share. The monthly bullion statement of the Potosi for August is as follows: Worked at Nevada mill 1600 tons of ore; gross proceeds in bullion, $34,170.22; cost of reducing, $9600; net proceeds in bullion, $24,570.22; assay value per ton, $16.15; gross average per ton, $21.35; net average per ton, $15.35; mill worked 81 per cent.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

For week ending August 22, 1893.

503,759.—Tree Protector—E. H. Black, Campbell, Cal.
503,899.—Fruit Drier—A. H. Carson, Grant's Pass, Ogn.
503,852.—Windmill—C. W. Clarke, Hanford, Cal.
503,593.—Motor—Grass & Hardie, Lassen, Cal.
503,785.—Amalgamator—J. S. Johnson, S. F.
503,655.—Crosscut Saw—J. B. Keily, Pleasant Home, Ogn.
503,787.—Bushing and Faucet—O. H. Merrick, S. F.
503,384.—Milk Cooler—F. J Merz, Seattle, Wash.
503,666.—Faucet—F. M. Mott, Perris, Cal.
503,752.—Fringe Holder—J. M. Schlesinger, San Jose, Cal.
503,754.—Car Coupling—W. E. Steffsy, San Diego, Cal.
503,820.—Oven Door—Webster & Hamilton, Pine Grove, Cal
503,830.—Hammer—C. Weigant, Portland, Ogn.

Note.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address Dewey & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the oldest, largest, best, most convenient, economical and specialty for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

JULIUS H. STRIEDINGER, M. Am. Soc. C. E.
OTTO von GELDERN, M. Am. Soc. C. E.

STRIEDINGER & VON GELDERN,

CIVIL AND MINING ENGINEERS, TECHNICAL EXPERTS, LICENSED SURVEYORS.

Hereby announce that they are prepared to make the Examinations, Surveys, Technical Drawings, Estimates and Reports required by the

CALIFORNIA DEBRIS COMMISSION,

Created by an Act of Congress, approved March 1, 1893, and to represent the petitioners before the Commission.

Address: 819 Market Street,
SAN FRANCISCO, CAL.

The Explorers' and Assayers Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

VOLUME LXVII.
Number 13.

SAN FRANCISCO, SATURDAY, SEPTEMBER 23, 1893.

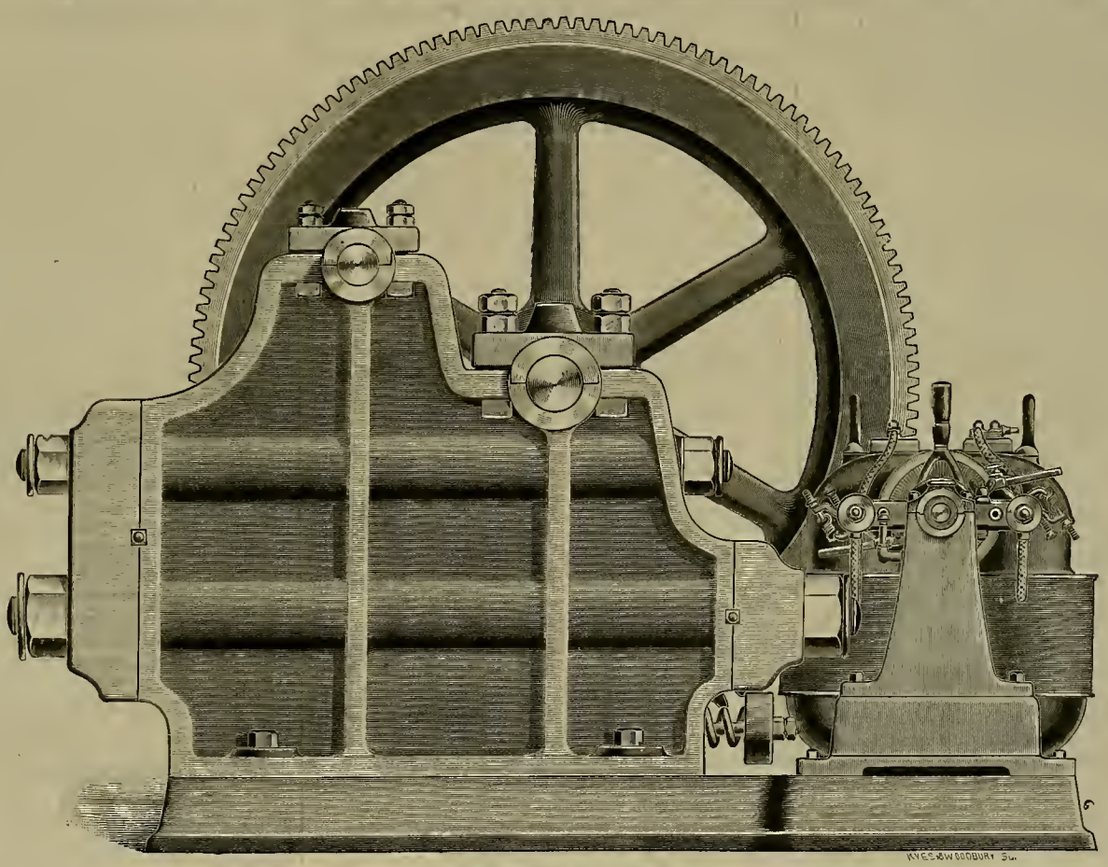
Three Dollars per Annum.
Single Copies, 10 Cents.

Electric Rock-Breaker.

On this page is presented an illustration of a rock-breaker of the Blake type, with dynamo attachment, as provided by the Thompson-Houston Electric Company, of Boston, Mass. The breaker is shown geared directly to the electric motor, all being mounted on the same bed-plate. The rock-breaker is shown with one flywheel off. The other wheel is fitted with a gear having cut teeth. An effective safety device in the form of a breaking plate, which is easily and quickly replaced, is fitted to the rock-breaker pitman, which will prevent any unusual or extraordinary strains due to foreign matter getting into the jaws, damaging either the rock-breaker or motor.

The gears and motor are encased so they can suffer no injury from flying rocks or dust, and are not a source of danger to the operator. The extreme compactness and simplicity of this machine will commend it to mill and mining men, road masters, contractors and others having use for such machines where electric power is available.

These motors are built of from 5 to 15-horse power, the capacity of the crushers ranging from 4 to 14 tons per hour. The complete weight of crusher and motor with the 5-horse power is 3800 pounds, and with the 15-horse power is 21,000 pounds.



ELECTRIC ROCK-BREAKER.

E. J. Ladd, an Oregon prospector who has been working in Josephine county, tells how by patience and perseverance he succeeded in tracking a three-foot vein of gold-bearing quartz, near the summit of a mountain. Float quartz had long been found in a creek at the foot of the mountain. Colors could be obtained by working dirt from its side, and prospect holes have been sunk in many places. Mr. Ladd went up the side of the mountain above all the prospect holes and kept taking dirt, three pans at a time, down to the creek and washing it till he got so far up that he could not find a color. Then he went back to the last place he had found gold and commenced to dig, and when he had gone a few feet he struck a three-foot vein of gold-bearing quartz. He thinks he has struck the proper plan for locating quartz ledges.

Judge Hawley, in the United States Circuit Court for Nevada, on Tuesday decided in favor of the defendant in the important case of Boot & Blowey versus the Justice Mining Company. The full text of the decision has not yet been received, but several subjects of much interest to mining men appear to have been passed upon by the Judge. They include the question of what constitutes a valid location, what is a ledge, affidavit of performance of labor, general work, course of location of mining claim by employe for the benefit of corporations, etc. Among other things said by telegraph advices to be held by the Judge is substantially that a location is valid if the claim is so marked by stakes and monuments that the boundaries may be readily traced, and that it is not essential to post the notice on the ground and within the boundaries; and, if the notice is posted on the ground, it is not necessary to post at the discovery shaft. If this is really the conclusion of the Judge, it is a material revision of the requirements for the location of mining claims, and will allow departure from the present practice in this respect. The full text of the decision will be awaited with interest.

The silver question in the Senate seems no nearer to conclusion than a week since. Senator Voorhees, champion of repeal, has threatened to resort to cloture, but it is doubtful if he can or will try to carry out his threat. It is hard to tell when a vote will be reached, but the silver men now appear to be strong enough to force a compromise of some sort. It may be simply a definite understanding as to what the subsequent measure following repeal shall be.

The silver question appears to have lost much of its interest throughout the country. The Senate has talked it almost to death.

A Stamp-Stem Guide.

A new anti-friction stamp-stem guide, having several novel and useful features, has been devised by H. P. Grugin of Bannock City, Mont. The invention consists essentially in a fixed stock, having a socket through which the stamp-stem moves, and a series of anti-friction balls seated and freely movable in channels in the stock, adjacent to the socket, and bearing on the bar or stem. These balls, which are rubber, are acted upon in the reciprocating motion of the stem, and have both a rotary motion on their axes and a bodily movement in travel along the course of the channel. The diameter of the balls is sufficient to cause them to project in the socket. The advantages claimed for the guide are as follows:

Though the balls may be of any suitable material, the highest efficiency is obtained by making them of rubber, whereby they serve as cushions as well as anti-friction bearings. It makes no difference which way the stamp drops on the die, nor how refractory the quartz is upon which it falls. The cam picks up the tappet easily, the rubber balls yielding sufficiently to ease the stem, and the friction is reduced to a minimum. Friction is also avoided in the contact of the cam and tappet, as the stem turns axially and easily upon the balls in the guide, and these parts, therefore, last longer. This guide also prevents the stem from breaking at the boss-head. No guide-fastener is needed, as the device is both guide and fastener. There is no wear except on the balls, which will last a long time and may be easily replaced. There are no fasteners to break, and the consequent stopping of the mill from this cause is avoided. Mr. Grugin has applied for letters patent on his invention.

Co-operation has been successfully adopted as the method for starting several of the idle mines at Leadville, Colo. The Maid of Erin has set the example, and others are expected to follow. The plan whereby the resumption took place was an agreement between the men and the management to deduct the expenses of operating from the gross receipts and divide the net profits on a percentage mutually satisfactory. Between 50 and 100 men went to work on the first day, and should the scheme prove successful the force will be largely increased, and many idle men thus be employed.

THE Anti-Debris Association, through its president, Mr. C. E. Stone, recently declared its confidence in the ability and character of the Debris Commission and advised farmers to let them alone; but it is apparent that this leaven of good sense and fairness will have little effect upon the mass of valley prejudice against miners, systematically excited by professional grangers. For example, we find a paper called the Wheatland *Four Corners*, in the hop center of Yuba county, solemnly declaring that the provisions of the Caminetti law are not practicable, and that "the moment the mountains of earth are torn loose down to bedrock no conceivable power within man's control will be able to cope with such a force and prevent the debris from ultimately filling up the river bottoms." It is, of course, possible that a conscientious course of inquiry into the various phases of hop culture, assisted by copious internal applications of the fermented product, may produce such a state of mind that one is able to grasp intuitively all the difficulties and point out the impossibilities of any given engineering problem. It is, therefore, very much to be deplored that the luminiferous Wheatland genius has seen fit thus to dismiss the subject with a generalization. The Government engineers think restraining works will restrain, and they are about to make the grave error of passing upon plans for various dams designed for that purpose. They are thoughtlessly risking reputations for good judgment, technical skill, and practical application thereof, gained by a long period of honorable and satisfactory service with the Government. An expedition should by all means be undertaken to the oracle of the hop fields of Wheatland, that wisdom may be learned ere it is too late.

THE PRESS is in receipt of the text of the decision of the Arizona Supreme Court in the case of the Watervale Mining Co. *vs.* Leach et al. The opinion was prepared by Associate Justice Kibbey and is interesting from the fact that it controverts the position on one important point heretofore uniformly assumed by bigh judicial authorities. The dispute in this particular case was over the interpretation of the mining laws relating to cross veins claimed by different persons who had made two locations covering the same territory. The decisions of the courts have heretofore been in such cases that the senior location is entitled to the ownership of the ore at the intersection only (besides the original vein), the junior location retaining possession of all ore in the cross vein except at this point, through which it has right of way. The Arizona decision, however, declares that the senior location is entitled to all the veins within its limits, the junior having no rights therein of any sort. Inasmuch as the apex of the cross vein appears to have been outside the lines of the senior location, we are disposed to regard the decision as more novel than sound.

Increase of Gold Output.

It is not too much to say that there is at the present time more interest and the enlistment of greater energy and more new capital in gold mining enterprises than in any other industry on the Pacific coast. Despite the dull times and the stagnation of trade and business pursuits, a general revival has taken place in gold enterprises, and there has occurred an awakening among miners and capitalists, not known since the days when the Sawyer decision was unthought of and its disastrous effects unexpected and unpredicted. No county in California that has gold in paying quantities within its borders has escaped the contagion of renewed activity and enlivened spirit, the investment of new capital, the presence of swarms of prospectors, the development of properties, the employment of more labor, and an increase in the gold output over recent years.

These statements are not idle, but can be supported by facts and figures of a convincing nature, to-wit: During the four months of 1893 ending with August the Selby Smelting and Lead Company deposited with the mint the following amounts of fine gold, received from its various depositors on the Pacific coast:

May	$ 990,733 49
June	1,372,065 28
July	1,500,653 20
August	1,355,507 96
Total	$5,219,059 93

The San Francisco mint was closed during the greater part of June and July, and practically all the product of the Pacific coast went to the Selby Works. When the mint is open, a large amount of the total product is handled by the government refinery. A monthly average of about $60,000 of the foregoing four months' receipts came from outside California, making the total receipts from this State nearly $5,000,000 for four months, or an average of $1,250,000 per month. But it must be remembered that during May and August the Selby Works handled only a portion of the output, which was in all probably about $2,900,000. Added to the June and July product ($2,872,718.48), we have a total from all Pacific coast sources of $5,772,718.48, of which about $5,500,000 came from California alone. The average production per month for this period is therefore $1,325,000. Of course the winter production is less than summer, but it seems safe to estimate fram these figures that the average monthly production in California for the current year will be $1,250,000, or a total of $15,000,000. The total for 1892 was $12,500,000. It is interesting in this connection to compare these figures with the production of former years. Since 1883 California has produced the following gold:

1883	$14,120,000
1884	13,500,000
1885	12,700,000
1886	14,725,000
1887	13,400,000
1888	12,750,000
1889	12,586,722
1890	12,500,000
1891	12,600,000
1892	12,571,000

If expectation is realized, California's gold yield in 1893 will be greater than for any year in the past decade.

These figures, while significant, sufficiently exact and eminently satisfactory, do not furnish a complete idea of the situation. There are many enterprizes now fairly under way from which no large results will be derived for some time in the future. If these enterprizes are carried to consummation, producing mines are worked to their present capacity, and none others are to be opened up for 1893 or 1894, it is safe to say that the coming will show a material increase in production over the present year.

No Settlement Reached.

Hope of immediate settlement of the miners' wage question on the Comstock was dispelled last Saturday, when the Miners' Union opened polls and voted on the proposition to reduce from $4 to $3.50 per day. More than two-thirds voted in the negative. The Mechanics' Union, which has cut an important part in consideration of the question, met the same day. A committee appointed to confer with the mine, milling, water and railroad interests submitted a report to the conference Thursday, at which the labor question was discussed. The magnates stated that reductions would be made to the general public in wood, water, transportation, etc. No guarantee was given that the mines would run any length of time provided the labor unions reduced wages 12½ per cent and that more miners would be employed. Afterward consideration of the whole matter was indefinitely postponed. The whole situation was much complicated by the action of the Gold Hill Miners' Union, which Tuesday evening declared in favor of reduction by a vote of 49 to 47.

It is to be seriously regretted that an amicable adjustment of the difficulty was not reached. The position of the miners and mechanics has been practically that they would consent to no reduction until officers' salaries came down, and other concessions relating to fuel, water, etc., bearing upon the cost of living, were made. It appears that heavy cuts in officers' salaries have really been made by a number of companies, and the definite promise of cheaper freight and fuel rates was given. Public sentiment and the equities of the case have heretofore been with the miners and mechanics. But now the owners have appeared disposed to do the fair thing and it may be seriously asked if the miners have not gone too far in the summary rejection of their offer. It is true that no satisfactory guaranty was given that more men would be employed or steady work given. But it is difficult to see just how the owners could bind themselves to such agreement in the present uncertain condition of the silver market. Matters have gotten into such shape between the owners and miners that the former will probably not hereafter be very anxious to resume negotiations, with a prospect that they will again be abruptly terminated. They went half way once and there appears to be very small inducement for them to go again.

A fair arrangement would be for the miners to consent to reduction until such time as the price of silver advances to a point of profit—the figure to be determined in advance. The freight and water concessions should be guaranteed on the part of the owners and their allies. This arrangement seems to us equitable and practicable. It must be remembered that outside of Nevada the miner's wage scale is less than $4 per day. The Comstock is no longer a bonanza either for miners, mechanics, officers or stockholders. The latter are most of all well prepared to endorse this statement.

The Gold-Mining Revival.

"I am not overstating the facts when I say that there is more activity in gold-mining operations, and a generally better feeling and more wholesome condition of things, than at any time since the beginning of the disastrous agitation that led to the suspension of hydraulic mining," said Mr. A. J. Ralston, president of the Selby Smelting & Lead Company, to a representative of the MINING AND SCIENTIFIC PRESS, Tuesday. "A marked increase in the volume of our refining business is direct and substantial proof of the improved aspect of the mining industry. The number of our depositors has recently become very much larger, and we encounter on every hand material evidence of the returning prosperity of the mines.

"The activity is the more notable because of the general business and industrial depression. It is brought about by a variety of causes, chief among which are the disposition of people in the interior to encourage gold-mining, by the dullness of other lines of metal production, by the fact that the inducements now offered to the prudent and intelligent miner are greater than ever before, and by favorable legislation looking to the resumption of hydraulic mining. Properly conducted, gold-mining is a safe and stable business, and it is now on a better and more legitimate footing than it has ever been.

"The Sawyer decision, which suspended hydraulic mining, was at the time of its delivery popular with a number of people. But public feeling has now changed, and, outside of a few who have, or think they have, interests to the contrary, is now altogether in favor of the miner. All realize what a heavy blow the loss of the product of these mines has been. The former opponents see their mistake, and many of them acknowledge it. Some of the difficulties they complained of were imaginary; others were magnified. The way is now opened to the resumption of hydraulic mining, and I feel satisfied that this branch of the industry will be rehabilitated. It may be slow work, but conditions are more in favor of the miner than for some years, and resumption seems to be only a question of time.

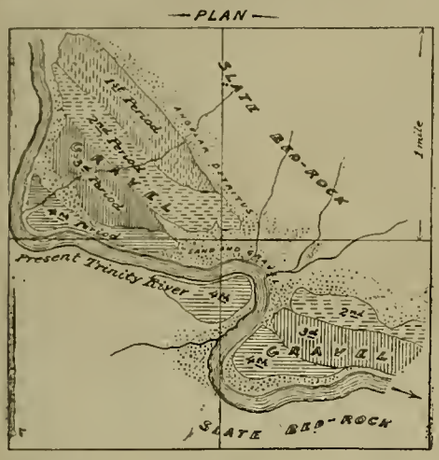
"I was much interested in some statements made to me the other day by Mr. W. S. Chapman, the well-known mining man. 'It has been demonstrated,' said he, 'that slickens is an actual benefit to the land, and not a detriment. It is a fertilizsr and adds to the wealth and the productive power of the soil. Cases have come under my own observation where shallow cultivation of slickens has yielded finely; in fact, so rich is the soil that deep cultivation makes rank products, and is a disadvantage. If people will only look at this thing as they should all objection to hydraulic mining will be withdrawn. In fact, I think the time will come when farmers will await with expectation of material advantage the season when the slickens shall come down from the mountains.'

"But to return to the subject: The gold-mining industry is, as a whole, in better shape than for many years. I am satisfied that we are fast approaching the time when the industry will be restored to something like its old-time prosperity and importance."

Trinity County Gravel Mines.

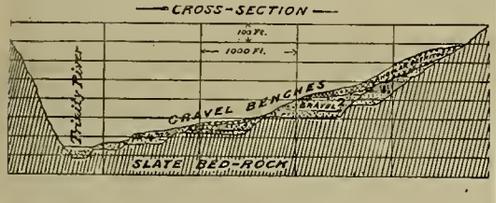
The Trinity county gravel mines are in a fortunate position as far as the debrie question ie concerned. There is no conflict with farming interests, and it does not eeem likely that tbe hydraulic miners will ever be restricted in tbeir onerations. The gravel deposits are somewhat varied in character. They cover large areas and promiee to furnish their fair ebare of the gold product of the country for a century or more to come.

Mr. Ross E. Browne, the mining engineer, furnishes ue with one of his illustrations of the manner of occurrence of the Trinity river gravels in the vicinity of Junction City. Mr. Browne describes tbese gravels as accumulatione on broad, flat benches representing dietinct periods of depoeit. In ages gone by, the river was apparently eubjected to



periodical freehete, each time changing ite couree eomewhat, cutting a deeper channel and leaving on the valley slopes limited patches of its former depoeit. In the illustration here given, there are repreeented four well-marked periods.

Theee benches are well situated for hydraulic mining, their elevation furniebing ample dumping room and grades for sluicing. Large bouldere are not especially



numeroue. There ie not much clay and no volcanic cap.

In the eection ebown the depth of gravel variee from 10 to 150 feet, and some of the benchee are dead level for a thoueand feet or more of their widthe. The greater part of the gold ie naturally contained in the bottom layere—it is well-washed river gold of medium eize and hae a fineneee (purity) of from .900 to .920.

Quite different from tbe Trinity river gravels ie the enormoue depoeit in the Weaverville baein. The latter ie mainly of angular fragments, partially rounded bouldere, sand, clay, etc., and ie doubtleee an accumulation reeulting fram glacial traneportation. It is very extensive, both in width and length, covering many equare miles, and in places its depth ie such that the present creeks of the Weaver basin have not cut down to within eeveral hundred feet of ite bed.

The main mass of this vast detrital accumulation is practically unassorted, but containe within it smaller channel courses, filled with true river gravel. In places the unaesorted mass has been teeted and found to contain gold enough to yield a profit in washing on a large ecale, but the miner with only a emall water eupply at hie command has generally preferred to confine his operations to the true channel courees within the main depoeit, relying on the concentratione prepared for him by the running streame.

An effort ie being made to induce Congrees to reviee and euepend for 1894 the operation of law requiring $100 annual work on unpatented claims, under penalty of relocation, or liability thereto, in January of each year. The silver minere who have cheerfully complied with the statute ever eince it wae enacted, twenty yeare ago, now find that it works great hardehip upon many of them. They are unable to expend the required amount. It ie propoeed to change the termination of the aeceesment year from January 1st to October 1st of each year, and to extend the period for making the annual expenditure for 1893 from December 31, 1893 to September 30, 1894. It is not, and ehould not be, the policy of the Government to exact onerous requirements of those who in good faith locate and are endeavoring to hold mining claime. The request of the minere is reasonable. Congreee should consider the depressed condition of the silver induetry and afford all needed relief.

Gold Mines of Oregon.

The minee of Oregon ehare in the recent general movement of gold properties. During the past year there hae been a very marked degree of activity in southern Oregon, and particularly in the vicinity of Aebland. New placer and quartz propertiee are being developed. Outside capital has been enlieted, many new companies formed, mills erected and minee worked.

Around Baker City, in eastern Oregon, the prosperity of the country almoet assumee the dimeneions of a "boom." Among recent enterprisee ie the propoeed conetruction of a 100-etamp mill on Big Eagle creek, where a ledge bearing ore of good grade ie to be worked. There have recently been eeveral important tranefere of mines, and it ie likely that the output of thie section will be greatly increaeed.

Union county, which has alwaye been one of tbe largeet of Oregon producers of gold, ie aleo keeping up with the proceesion. The country ie being more thoroughly proepected than ever before, and we may from now on expect to hear frequent announcements of new finde and the undertaking of new enterprises.

Several yeare ago, when eilver mining was attracting eo much attention and money, Oregon wae very thoroughly eearched for good eilver properties. Tbere were eeveral dietricts in which excellent proepects were ehown, and which were thought to be capable of profitable development; but eomehow the outpnt never amounted to very much. On the contrary, it has always been known that there was paying gold ore in the hille, and it ie surprising that more extensive development in that line hae not before thie taken place. The prospect is that the real merits of Oregon ae a gold yield will hereafter be better appreciated. The output of the State for 1892 ie officially computed at $1,491,781.39. We expect to see an increaee for 1893 that will bring the figures up to the vicinity of $2,000,000.

Foundry Notes.

Another cargo of armor plating for the Monterey and the Monadnock has been received at the Mare Island yard.

Caton's Foundry and Machine Company, of San Jose, has been incorporated. Capital stock, $50,000, with F. E. Caton, B. F. Bailey, F. B. Warring, W. B. Ruse and David Johns of San Jose as directors.

The lighthouse tender Manzanita is to be thoroughly overhanled and repaired at Astoria. Proposals for the work have been received by Captain Farenholt, the inspector, the lowest bid being $3127 for the woodwork and $1993 for the ironwork.

Rapid progress is being made at the Washington gnn foundry in the construction of twelve 13-inch rifles for the four new battle-ships nearing completion. Seven are practically complete, three are ready for testing, and the test will be made as soon as the important question of powder has been determined. These are the most powerful guns ever built for the United States navy.

Representative Hilborn has introduced a bill making an appropriation of $700,000 for a new drydock at Mare Island. The bill calls for an immediate appropriation of $150,000, and $700,000 is to be the limit of cost. Another drydock at Mare Island is needed and it wonld be an absolute necessity in time of war. The Navy Department will, at Mr. Hilborn's suggestion, recommend its construction.

Secretary Herbert has anthorized the rebuilding of the old flagship Hartford at Vallejo in accordance with a recent act of Congress. It is stated that he has anthorized the expenditure of $456,244 for this purpose, approving the entire recommendations of the Board of Construction. It is announced that orders are at hand directing that the work of reconstruction begin at once. The allotments of money by the department are as follows: To reconstruct hull, $276,000; new engines, improved marine type, $160,000; equipment, $194,000. A recent act of Congress leaves it at the discretion of the Secretary of the Navy to bnild a new vessel or reconstruct the Hartford. The above figures do not show the armament. It is generally nnderstood that just as soon as this money reaches San Francisco and is made available to the authorities at Mare Island, work on the old flagship will be commenced at once.

In an interview with a representative of the Joshua Hendy Machine Works, No. 51 Fremont street, this city, the Press was informed that notwithstanding the marked depression in trade in the nsnal and ordinary lines of machinery, yet during two months past these works have done a fair bnsiness in certain of their specialties of quartz milling and hydraulic mining machinery. They have furnished a 5-stamp mill, complete, for use in Oregon, and a complete 10-stamp mill to be operated in Shasta county, and also a 20-stamp mill erected in one of the southern connties of this State, each of the above having an entire eqnipment of all of the usual accessories for the proper milling of gold-bearing ores. In conjunction with the last-named mill they furnished a large pumping plant, comprising two Buffalo compound dnplex steam pumps of 14 and 22-inch cylinders respectively, and 18-inch stroke, successfully pumping from 6000 to 8000 gallons of water per hour through a pipe three inches in diameter and 12 miles in length, taking the water from the Colorado river and raising it to an elevation of about 600 feet, for mill-battery use and camp supply. They have further furnished a fair number of "Challenge" ore feeders for use in Mexico, North Carolina and elsewhere, and also a number of the improved form of "Triumph" ore concentrators, besides hoisting buckets and cars for mining purposes, and a large amount of tee rail and water pipe. They have also shipped for nse in British Columbia, Oregon, Montana, and other States, several plants consisting of sheet-iron pipe, water-gates, giants, etc., for hydraulic miuing, and have very recently supplied an hydraulic gravel elevator, water-lifter or pnmp, with water-gates, giants, etc., for hydraulicking in Plumas county. Their sales of boilers, engines, pumps, etc., while limited by the contraction of trade, have been considerable.

Slickens.

The Syndicate mill at Bodie is running on tailings belonging to the Bodie Con. Company.

A bullion shipment, valued at about $36,000, has been received from the mines of Candelaria, Mexico.

The Denver *Republican* prints a list of seventy-six Cripple Creek properties which are producers of pay ore.

W. W. Mendenhall of San Francisco and Frank Leavitt have resumed work in the Malone mine at Mariposa.

W. E. Sharon, superintendent of the Yellow Jacket, Belcher and other Gold Hill mines, will leave for the World's Fair.

The camp of Carson, Pine valley, Union county, Oregon, has been started. Much activity has recently been displayed in its vicinity.

The Calumet and Hecla Copper Mining Co. of Michigan has declared a dividend of $5 per share, or $500,000, payable September 27th.

The Plumas Mining and Water Company advertises that it will change its principal place of business from Spanish Ranch, Plumas connty, to Sau Francisco.

The Miners' Federatiou at Nottinghamshire, England, has decided that its members shall not return to work at the old wages, and that they will not accept an offer of arbitration.

Shingle Springs, El Dorado county, has recently assumed much activity. Several new mines are being opened and old ones reopened, or preparations to that end are being made.

It is rumored in Grass Valley that Prof. James D. Hague, the mining engineer, has bonght most of the stock in the Stockbridge mine at Rocky Bar and will proceed to develop tbe same.

Collector Wise is looking for a competent assayer, who shall receive the appointment of inspector of drugs, chemicals and medicines at the custom honse. His duties shall include the assay of ores.

The Farrell mine of San Jose has been incorporated. Capital stock $100,000, with C. D. Wright, of San Jose, and N. H. Seligman, R. Wise, Natban Roseuberg and Melvin Wise of Oaklaud as directors.

The Champion Mining Company have on tbe ground, and will have in operation very soon, the largest pumping machinery ever erected in this State, says the Nevada *Transcript*. It is a sight to look at the present works.

The largest shipment of placer gold ever received at the Denver Mint arrived one day last week. Tbere were 590 ounces of it and 240 ounces of retort gold. The Lemhi placers, near Salmon City, Idaho, prodnced the gold.

It is reported in Nevada City tbat James L. Flood and John W. Mackay will send one of their mining experts there the last of this month to examine two mines in the Nevada City mining district, with a view of purchasing tbem.

Articles of incorporation of the Buck Horn Gold-Mining Compsny have been filed in San Francisco. Directors—George W. Osborn, G. W. Osborn, Jr., I. C. Given, George W. Waitt and C. F. Bunker. Capital stock, $100,000.

The Mechanics' Gold Mining Company of Amador County, of Oakland, has been incorporated. Capital stock $300,000, with Charles J. Raleigh, Delos Pratt, Hermon A. Pratt, Frank Kings and Edwin L. Arnest of Oakland as directors.

The Stillwater Mining and Milling Company of Sacramento has been incorporated. Capital stock $100,000, with W. S. Weymonth of Drytown, George A. Holbrook, J. H. Gray, John Guslin and A. M. Cunningham of Sacramento as directors.

Owing to the low price of copper, the Copper Queen Co. at Bisbee, A. T., have found it necessary to reduce wages, and hereafter men who have been receiving $3.50 or over will be rednced 50 cents, and those nnder $3 will be reduced 25 cents.

A big silver convention was held at Albnquerqne, New Mexico, Wednesday, at which strong silver resolutions were passed. Afterward, it was resolved into a statehood convention, and steps looking to the admission of New Mexico as a State were taken.

We find in a Shasta county paper reference to a new process for working silver ores at Sonth Fork. It is a "pattern furnace, which chloridizes the ore with less wood and in shorter time than the old process." The somewhat sangnine statement is made that it will work "95 per cent of the base ore."

A. P. Forbes of this city has gone to Groveland, Tuolumne connty, where he will assnme the superintendency of the new Talc mine. The shaft is now down seventy feet, and it is proposed to continne active development. The rock assays from $18 to $20 per ton. It is thought to be an excellent property.

The mining interests of this county are looking better every week, says the Calaveras *Citizen*, and every section of the connty has some mining men puttiug things in readiness for the development of good leads of quartz. Our mines are all gold mines, and, as there is no discount on gold, they are eagerly sought for.

An exhibition of mining and metallnrgical appliances is to be held at Santiago in Chili next year, beginning on March 15th. The exhibition is under the charge of tbe Sociedad de Fomento Fabril, and any information in relation to it can be obtained from Señor Jnlio Perez Canto, secretary of the society at Santiago.

F. J. Zeehandelaar, a well-known newspaper man, formerly of this city and for fonr years past a resident of Spokane, where he has for a good part of the time been publishing the Spokane

Mining Record, is in San Francisco. He says it is extremely dull all through the Northwest now, with no indications of early improvement.

A CASE involving title to school lands worth $1,000,000, situated less than two miles from the business center of Tacoma, Wash., is to be heard before Secretary Hoke Smith, September 26th. John G. McBride, a merchant, claimed to have discovered gold, and filed his claims. The case now to be heard is the State's appeal from the Land Office Commissioner's decision in favor of McBride.

AMONG passengers for New York on the new steamship Lucania, which arrived recently, was Mr. Thomas G. Clayton of Derby, superintendent of construction of the Midland railway of England. He comes as the guest of his brother, Mr. James Clayton, president of the Clayton Air Compressor Works, New York, and while here will visit the World's Fair and make a study of the railway systems of this country.

THE quartz-mill owned by the Princess Mining Company at Alamo, San Diego county, was burned by incendiaries Sept. 14th, probably by Mexican miners with a grudge against the management of the company. The mill contained two Huntington quartz-mills, concentrators, crushers, etc., and a valuable engine and boiler. The mill and machinery are a total loss, amounting to about $12,000.

THE official statistics of the production of gold in Russia in 1892 show that the output of the mines has been greatly increased by the improvement of technical appliances. The production of the precious metal has reached a total of no less than 2601 puds, as compared with 2382 puds in 1891, and only 2041 puds in 1885. Taking the value of the pud on the average at 14,104 roubles, there is thus a total of 36,670,000 roubles or about $25,000,000.

THE Eclipse mine, situated in Requa gulch, Cripple Creek, Colo., has been sold by the numerous owners to R. W. Woodbury of Denver for $60,000. This mine became famous in the history of the camp as a producer of cubes of gold, something exceedingly rare. Many of these cubes exceeded one-eighth of an inch across the face and were found in both quartz and white talc. The mine has produced $12,000 or $15,000 worth of high-grade ore.

A GREAT DIAMOND was recently found in the African fields and is now in the hands of a cutter. It has been named the "Excelsior." It is in such good shape that it is believed it will weigh 500 carats when cut, which is several times larger than any other stone. There appears, however, to be a little black speck near the center, which may make it necessary to cut the diamond in two. Even then the two stones would be larger than any others, and of perfect color. The Imperial, the next largest white diamond, sold for $1,000,000. It is said that the owners want $1,250,000 for the Excelsior.

HARVEY P. JONES of Denver, Col., has patented a drill adapted to be operated by hand or power, which may be held at any desired angle, and has an automatic feed. The drill-holding frame is supported by a strap from the body of the workman, who turns an operating crank by hand, pulling back a hammer against the tension of springs, the hammer upon its release striking upon the shank of the drill. The rebound of the drill is taken up by a special mechanism, which is such that by a moderate turning of the crank a rapid succession of powerful blows will be struck and the drill will be held up to its work all the time. The principle of Mr. Jones' drill is not new, but it may be novel in some of its minor features.

Use of Explosives in Australia.

[Extract from report for 1892 by H. B. Nicholas, Senior Inspector of Mines for Central and Melbourne Districts to Minister of Mines for Victoria, Australia.]

Information about explosives, collected at the instance of the department, shows the high estimation which miners have of the nitro-glycerine compound—gelatine—and that there is unanimity of opinion thereon. The use of more powerful detonators is increasing, but not so quickly as their economic value would lead us to expect. The rapid and complete combustion of the explosive, through the use of the strongest detonators, assures the greatest effect of the charge and the minimum vitiation of the air. These are properties which every manager and miner should appreciate at once and should make every effort to secure. At the close of the year my attention was drawn to a handbill of an explosive manufacturing company, headed "Directions for the Use of Lithofracteur and Dynamite." The first was to the effect, "if hardened, as is frequently the case in cold weather, the cartridges may be softened by being kept in the workmen's pockets." Many years ago this course was suggested by the German manufacturers, but it is difficult to realize that such directions could be issued in Australia to-day. My correspondent remarked: "It makes me shudder to think of what will happen to some poor fellow who is a smoker and carries out this direction. It should be withdrawn." Of course the withdrawal of this direction is a matter for the consideration of the interested company, but I strongly condemn its further publication.

Safety Appliances.—There is no record of accidents to miners through cage mishaps. I have occasionally received notices of overwinding by engine-drivers, with statements that they were attended by loss of time only through stoppage of winding, or by slight damage to property by the detaching of the rope at the pit-head. The use of safety hooks, that disconnect the rope and suspend the cage, is almost universal. During the year I have made numerous satisfactory tests of the safety appliances of cages, and also have received reports of tests from the mining managers of all the mines of my district.

Gold in Ocean Water.

Extract from paper read by T. A. Rickard, of Denver, Colo., before International Engineering Congress, Chicago, August, 1893.]

The waters of the ocean contain gold. In 1851, Malaguti and Durocher determined the occurrence of silver, but did not extend their inquiries into the question of the presence of gold in sea-water. This fact was first accurately determined by Sonstadt in 1872. His experiments were not quantitative, but he stated, in parenthesis, that the amount was "certainly less than one grain in the ton." More recently, however, Münster found an average of five milligrammes per ton. In endeavoring to arrive at an approximate estimate, it must be remembered that local conditions, such as the temperature of the water, will affect the amount in solution. Sonstadt's researches were made with water obtained near Ramsey, in the Isle of Man, while Münster got his from the Kristiania Fjord. In each case the sea-water was that of a northern latitude. In warmer regions it is probable that precipitation, due to the presence of putrescent organic matter, may diminish the amount of gold held in solution. Let us, however, take five milligrammes (equivalent to one-thirteenth of a grain) as an approximation. This, though in itself a minute quantity, will be found to represent an enormous total amount of gold in the waters of the ocean. From the results obtained from the careful soundings carried out by the Challenger and similar scientific expeditions, it has been computed that the ocean has an average depth of 2500 fathoms, and that it contains four hundred million cubic miles of water. This is equivalent to about 1,837,030,272,000 million tons, which, upon the basis of five milligrammes per ton, would represent 10,250 million tons of gold. By way of contrast, it may be added that, according to Soetbeer, Leech and others, the gold production of the world, from the beginning of 1493 to the end of 1892—a period of exactly four centuries—has amounted to only 5020 tons. The present output is equal to about 200 tons per annum.

The gold in sea-water is kept in solution as an iodide. The amount of free iodine present in the ocean is very minute, but a large proportion of that element occurs combined as an iodate of calcium. From the results of a series of six experiments, Sonstadt found that a cubic mile of sea-water contains about 17,000 tons of iodate of calcium, or 11,072 tons of iodine. This represents the occurrence in the entire ocean of no less than 4,428,800 million tons of iodine.

The iodine which maintains the gold in solution is obtained from the iodate of calcium. Gold is soluble in extremely dilute solutions of iodine, which, under ordinary conditions, are in turn readily reduced by organic matter. That the gold in the sea is not precipitated is due to the presence of the iodate of calcium in which it is not soluble, but which, being readily decomposed by *putrescible* organic matter, liberates the iodine required to keep the gold in solution.

There is reason to believe that the sea-waters of to-day contain much less iodine than those of former geological periods. That there is so little free iodine in the ocean is due to causes parallel to those which bring about the noteworthy absence of carbonate of lime. Marine animals abstract the latter while marine plants absorb the former. How great is the work done in this way is evidenced by the dimensions of the coral reefs and by the extent of the foraminiferous and other marine limestones.

The abstraction of iodine is no less striking. Seaweeds, and more particularly those which grow at great depths, are the chief source of the iodine of commerce. When, after a storm, such seaweeds are cast upon the shores of Great Britain, France and Sweden, they are collected and burned, and from their fused ashes, termed "kelp," the iodine is subsequently extracted by a simple chemical process. From 13,000 kilos of kelp, about 100 kilos of sodium carbonate and 15 kilos of iodine are obtained.

That iodine is not now so plentiful in the sea as during former geological periods has been suggested by chemical investigations into the composition of rocks. Certain sedimentary formations contain notable quantities of it. It has been found in some aluminous shales in Sweden and also in certain varieties of coal and turf. The saline waters of several springs contain large amounts of it. Even rain-water has been known to give a recognizable iodine reaction when tested, such iodine having been obtained by the agency of winds which have been blowing over certain areas of the sea where it was being liberated by the action of organic matter upon the iodate of calcium.

TUOLUMNE is in line with the general activity and progress of the gold-bearing counties of California. The *Independent* declares that a number of old mines in the Summersville and Cherokee districts will be reopened shortly and that several mines have already started with good prospects. Other parts of the county expect to share in the prosperity of a general revival of gold mining.

Classification Should Precede Concentration.

[Extract from report for 1892 of J. C. Newberry, Mining Engineer, to Minister of Mines for Victoria, Australia.]

Wet concentration processes have attracted much attention of late, but, owing to various causes, no modern plants based on scientific principles such as are now generally adopted in Europe have been erected, and, as a fact, in many parts of the colony there has been a retrograde movement, and payable material has gone to waste. The most efficient concentrating plant is at the South German mine, Maldon, where there is some attempt to classify the crushed stone and then concentrate the sands and slime on Triumph vanners; but even at these works, Chinamen treat the tailings after they leave the vanners. At Daylesford, the Frue vanners are working better than on any other field, but here both Chinese and Europeans work the tailings, and after they have done their best the tailings still assay 2 dwt. per ton, and give a vanner concentrate assaying 6 oz. per ton. At other places the vanners do very little good. The true cause of the failure is not the fault of the machine, but is that they do not get fair play, being, as a rule, overloaded with both sand and water, and they are made to deal with coarse and fine materials of various specific gravities at one and the same time. It cannot be too often repeated that classification must precede concentration.

Vanner Test.—After my recent visit to Europe, the Luhrig Ore Dressing Company gave me one of the single vanners used in their system of ore dressing. I erected it at the Australian Electric Light Co.'s works, at Richmond. So far as Victorian auriferous tailings are concerned, we have demonstrated that the bulk of the tailings of nearly every district in the colony may be profitably re-worked. Bulk samples have been treated from Ballarat, Bendigo, Costerfield, Chiltern, Maldon, Daylesford, Rushworth, Walhalla, and other places. Before treatment on the vanner, the tailings were classified and, without one exception, no payable gold (i. e., about half a penny-weight per ton) was found in the sand, which remained on a brass gauge sieve of 50 holes to linear inch, and this coarse sand as a rule, amounts to about 50 per cent of the whole. So that, practically, this separation of fine from coarse grains reduces the bulk to be treated by half, and the half to be treated has nearly double the value of the original sand. Its subsequent treatment on vanners becomes a simple, inexpensive process.

Walhalla Tailings.—The exception just mentioned was in the case of the tailings from the Long Tunnel Company, Walhalla. Two series of trials were made with carefully collected bulk samples. The first sample was collected under the manager's direction, and the second actually by himself, as he doubted the loss reported in the first instance. The sand as received assayed 12 dwt. of gold per ton; on classification about half the gold remained with the coarse sand on a 50-mesh sieve, and a microscopic examination showed that the gold was in or attached to the quartz grains, and that no concentration without recrushing could save it. The fine material concentrated easily with but little loss—the concentrate assayed equal to 26 ounces of fine gold per ton. To prevent the loss of gold in the coarser sand a finer grating must be used on the battery boxes; or what, in my opinion, would give better results would be to continue the coarse crushing, classify the sands, recrush the coarser grained in some grinding mill, amalgamate with mercury (for the gold is nearly all free from pyrites), and pass the overflow from the amalgamators to the classifiers and vanners, where it will be concentrated with that which was crushed fine in the battery. Mr. Ramsay Thomson's sample may from some cause have been abnormally rich, but if it is a fair average it shows an almost incredible loss. The capacity of the battery is, I am told, about 100 tons per day: this, at 12 dwt., is 60 ounces per day, or £72,000 for the working days of the year. The lowest Walhalla assay I have made during the year gave 6 dwt. per ton, but the sand contained very little fine grains or slime.

ARTHUR L. PEARSE, a London mining engineer, who has just arrived in San Francisco from South America, declares that not more than four mines are being worked in all the richly metalliferous mountain districts of Peru, and those which are in operation are on the verge of closing down because of the little money to be made. Cessation of operations because of lack of profit would appear to be sufficient to dispel the glamor of romance which has always surrounded the Peruvian mines. As a matter of fact, the cost of silver production in these southern countries is considerably more than it is in the United States. All the machinery necessary to the equipment and working of the mines has to be transported at great expense over rugged mountain trails. The ore has to be taken to distant railway stations, packed upon mules. Indian labor is cheap, but it is slower and less intelligent than white labor.

A Cabinet Officer as a Smatterer in Mining Law.

TO THE EDITOR:—In the PRESS of January 14th last, there appeared an article headed "One Location to One Discovery," in which it was stated that Secretary of the Interior John W. Noble had cancelled the patent of J. F. Bigelow to two mining claims in the Marysville district, on the ground of only one discovery having been made, and even of that the existence had not been alleged in the location notices. As fraud has heretofore been the sole offence visited with patent cancellation, I felt desirous, on public grounds, of seeing copies of the notices in question, but on making an effort in that direction all I could learn was that the business was controlled by a Washington law firm, who hoped to secure a reversal of the decision. Not caring to address these lawyers, I acquired no further information on the subject than that which the article alluded to supplied. Of course if Mr. Bigelow's grantors had not found a mineral lode, cancellation of the patents was entirely proper, but that is not at all a likely supposition. If I had been enabled to look into the merits or demerits of the case before printing this article, it might have been of more service for the future guidance of prospectors than it can be now, but there are other matters in Mr. Noble's decision which call for criticism, and hence I send it to you.

The Secretary's main objection to the Bigelow claims seemed to be based on the fact that they were end-to-end locations, and in declaring them invalid he says nothing whatever as to his having proof that the vein claimed for 3000 feet did not, within that distance, "crop out" at any other than the locating point. If either locator had found the vein elsewhere within the lines than at the initial monuments, the decision, even from his own standpoint, was unjust and unworthy of a man professing to have a judicial mind. Ever since the Congressional mining law of 1866 was passed, the Government has been issuing patents to mining claims located in the way which is now condemned as fraudulent. Even for three and three-quarter years Mr. Noble, as Secretary of the Interior, went on contentedly granting patent after patent to mining claims initiated in the very way adopted by Mr. Bigelow's grantors. Either he neglected to do his duty during these years or later he was actuated by unworthy motives. It was the queer fact that he had suddenly become a strict expounder of mining, just as his official reign was about to end, which made me curious to ascertain what his real motives could be. His aim was not to interpret an existing mining law, but to enact, without the aid of Congress, a measure to suit himself. "No man being rational," says the Secretary, "would discover a vein or lode and so describe the location as to make one of the end lines run through the center of the discovery shaft, thus leaving territory not located in which it was demonstrated that ore existed and which might have been included in the description."

From this quotation it will be seen that the writer of it did not consider a prospector competent to establish his end lines satisfactorily, but he, sitting in Washington, was fully capable of instructing him on that point. While I believe that an explorer would in most cases show true wisdom in refraining from locating two claims at a given point on a lode, the law does not forbid the practice. It says: "No location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located." There is nothing here requiring the mineral discovery to be 700 feet from one end of the location, or 700 inches, or even seven inches. If the discovery is inside of the "limits of the claim" by one foot the law is fully complied with.

If two miners met at a mineral outcrop six feet in length, and made the conterminous end-lines of two locations to cross it, so that each should have three feet, the claims could not, under the Noble decision, be declared invalid without proof being offered that at no other point within the 3000 feet appropriated had the vein been found. Mr. Noble offers no such proof in Mr. Bigelow's case. He interprets the law in a way the law does not interpret itself. He assumes, without any reason, that a locator's initial monument is always placed where his discovery has been made. "A discovery is a whole," says he, "and may not be divided and parceled out among several discoverers." That is true, but the real point is the extent of the "whole." If a prospector finds a small cropping of promising ore, he does not know whether he has got something of real value or nothing at all until he has devoted hours, and even days, in examining the ground which it seems to traverse. The "discovery" he has made is a very small part of the "whole" which he hopes to secure. Is there vacant space for a 1500-foot location? Is there a vein or has he only found what some miners call "a blow-out," that may be exhausted in a few hours? What signs of a lode or "wall rocks" does he see? If there are evidences of a ledge, recognizable by the experienced locator but telling nothing to the "tenderfoot," is it likely to pass into another kind of formation? These questions have all to be answered in the skilled prospector's satisfaction before he decides to make a location. To him a "discovery" is a "whole" 1500-foot claim of the mineral domain, which he has secured free from all dispute. If he is ambitious to do his best in his chosen line of occupation (which is the duty of every man), he will not rest contented with the little bunch of ore, or it may be only "indications" that might lead to ore, which first attracted his attention. He will keep breaking rock and digging holes until he has made several exposures of vein matter, which of themselves would meet the requirements of the law as to a "discovery."

These are important matters about which Mr. Harrison's Secretary of the Interior did not know anything at all. To him a little deposit of ore, not worth perhaps a ten-cent piece to anybody, is the harbinger, the "discovery," the "whole" of a great coming mine, likely to be worth millions of dollars, and he as protector of the Government's rights must see that its mineral treasures are not seized by unscrupulous men. What twaddle ignorance makes men, who think themselves wise, guilty of uttering, especially when for a brief time they get out of obscurity into the light of civilized day! Mr. Noble evidently considered good soil and good mineral lodes two kinds of Government property, alike easily exhausted by locators. But land, though abandoned by a shiftless occupier, is still of value, or will be some day. As to the thousands of "discoveries," holes and "wholes" which an old-time prospector has made, or tried to make, who was the chief loser when he abandoned them forever because of their worthlessness? Not the Government certainly, for it still owns them, but the pioneer himself, who sought a great deal more than he found.

Even a capitalist may pay the Government $5 an acre for a lode which will never be productive. If he had spent much on it he might add to the outlay and give time a chance to play a part in its history.

Ninety-nine one-hundredths of the mining claims located are worthless until money has been expended on them, and many, too, are proved to be that when the expenditure has been made. Save them by all means, Mr. Secretary, for the Government, for it is the only power that can hold them and not be crushed.

Our mining law is liberal to the prospector. It avoids dictation and rewards him for the risks he takes by making it easy in most cases to acquire a perfect title.

The executive officers of the Government have usually made its generous, sagacious spirit their guiding standard. And it is no more than right that they should do this. If a prospector going out into a wilderness finds a mineral belt where he and others subsequently locate valuable mines, which in time keep thousands of men at work and put millions of dollars in commercial hands, his pioneering work makes him a public benefactor. If, without influence or money, he can by his energy, fearlessness and prospecting skill, make a valueless mountain the source of wealth to others, if not to himself, he has even then not lived wholly in vain.

The end lines of a mining claim are established at times by a practical system of reasoning on the part of a locator. He walks along the visible or partially blind outcrop, watching for mineral stains in the inclosing country rock. These stains tell him that there is ore in the near-by vein. When the stains cease he knows in a general way that he has come to the end of an ore-chute, and as he does not want any of the outlying territory, he gives it to some neighbor, who, perhaps, cannot on his own account find anything of value, for a week's work to be done at the end of the claim he has just staked out.

If the vein exposed by such work looks better than was expected, both men may, for economy's sake, keep working along there. Each of these locators, I will assume, has found the lode at several spots within his lines. After some years a capitalist buys, in good faith, both locations, but suddenly finds that the patents issued to him have been canceled because his grantors were declared by the Secretary of the Interior to be irrational beings, in that they had made locations in the very way that hundreds of patented mines had been located in the long ago.

I do not know whether this hypothetical case resembles that of Mr. Bigelow in any respect, but I do assert that a Secretary of the Interior who deemed it his duty to cancel patents to lodes located in the way described would thereby show his unfitness to hold the office bestowed upon him.

There are cases where two full locations ought invariably to be made end to end. I have a deep, narrow canyon in view, where the apexes of several very valuable veins are visible only for a few feet as they cross its bed. For miles on the one side and a long distance on the other, the ore-bearing formation is deeply covered by volcanic rock. Under Mr. Noble's dictum only one location could be made on each of these lodes. But here is an opportunity for the Government, the miner and the country at large to win 3000 feet on each of such lodes, in place of 1500 feet. Now in part of the concealed veins could ever be found by surface work, and save for one thing their treasures might be undiscovered and worthless for hundreds of years. That one thing is this: If the owners of one location on each ledge found the property good, they would in time run drifts to the vacant ground and locate two more claims on each lode. They would thus through the mining ignorance of a forgotten Secretary of the Interior secure a monopoly of 4500 feet on each. A result like that would be a pat exemplification of Mr. Noble's theory that a "discovery" is a "whole," and must not be divided.

Then, again, lodes often crop out on a mountain summit without being visible on either side. A prospector living to the south of the range would not want anything on its north side. If he located one way, and a man living on the northern slope claimed the other end, some future Mr. Bigelow would suffer, because a Secretary of the Interior of the Noble caliber did not know enough to discharge the duties devolving upon him in an equitable way. Our present Secretary of the Interior ought to abrogate Mr. Noble's decisions, for the following reasons:

First—It is not a ruling on an existing mining law, but an attempt to enact a new measure.

Second—It dictates to the prospector as to the locating of mineral ground, when the law itself avoids dictation.

Third—By inference, it requires the initial and discovery monument to be about half way between the two ends of a claim, when the law leaves that matter entirely to the judgment of the locator.

Fourth—It, in effect, decides that a mining location cannot be legally made from one end, while the General Land Office is every day issuing patents to mining claims located in that way.

Fifth—It prevents the locating of two claims end to end, when it would be of advantage to the Government, to the miner, and to the country generally that, in certain cases, such locations should be made, and

Sixth—The decision is whimsical, weak, and unworthy of the Government's liberality to prospecting miners.

As long as the decision in question remains unreversed, it will be well, in locating a lode, to have the mineral discovery well inside the claim lengthwise. In Arizona, a printed form of notice is very generally used. It invariably makes an end-center monument the initial point, and it never indicates the relative position of the mineral discovery. A cancellation of patents to lodes so located may some day convince claimants that greater definiteness would be an advantage. To make the Noble decision harmless, the initial monument of a claim should be placed beside the mineral discovery. The difference between a good and a bad mining title depends, at times, on very small matters being attended to in preparing a location notice. Exactness is essential. It will be wise also for those who wish to patent two end-to-end locations, to send in but one at a time to the Land Office. If Mr. Noble had seen only one patent it would not have been cancelled, but two patents on one lode, to one applicant, at one time, completely upset him.

A haphazard decision of the kind criticized proves conclusively that our mining law, good though it be in its main requirements, ought to be amended. Its language in some places is so indefinite that several opinions as to its actual meaning might be given—nearly all alike reasonable. The great obstacle to a sensible revision of its defects is found in the person of Senator Wm. M. Stewart. He seems to believe that he, and he alone, can satisfactorily revise the law, and the comical part of his performance in that line is seen in the fact that he plainly does not understand the law which he seeks to amend. He will probably soon introduce a new mining bill in Congress, filled with the old blundering rigmarole of his previous productions, and if any other bill were brought forward, he would fight it as an intruder upon his domain. If the ex-Secretary of the Interior and the Nevada Senator were valued by the mining community according to their own estimates of themselves, they would be universally regarded as a pair of great mining lawyers. JOHN DARE EMERSLEY.

Dos Cabezos, Cochise Co., Ariz., Sept. 7th.

THE Amador *Record* declares that a new era is dawning in that county, and that there is more activity in gold-mining than for some years. Several old properties that have been shut down for some time, like the Bunker Hill, Quartz Mountain, Belmont and others, are being reopened under most favorable auspices. Home people, too, are getting interested, and prospectors are out in numbers hunting for indications and looking for new ledges. The *Record* calls attention to the tendency to develop ledges along the Mother lode only, and declares that there are numerous other gold-bearing veins and gravel deposits which have heretofore remained untouched and almost unnoticed.

Mechanical Concentration of Ores.

By J. J. East, Fellow of the Geographical Society, in *Australian Mining Standard.*]

By regulating the force of a stream of water which rolls the solid particles along over the hed is due the successful operation of various devices known as tyes, huddles, vanners, and variously named tables. The action of the current may he assisted by giving the current a side push or thump to create further disturbances among the particles, and so assist the scouring or rolling action set up hy the current. No particle is of defined geometrical shape, but only an approximation to such; and in the case of splinters or ohlong fragments lying with their narrowest parts against the stream, they must be dislodged from the position assumed before they can be carried farther down. The thump given the hed on which they rest not only dislodges them, hut throws them somewhat nearer one side or the other of the channel, and so prolongs their journey's length. The particles lying heaviest on the bed will be thrown farthest and out of touch with those lighter particles which may have lodged in front of them, and in this manner the scouring current makes a fresh sweep of the place they had blocked.

The German grave buddle or Cornish tye operates after the manner of the sedimentation of a river channel. The water is led in a current ten inches wide and half an inch deep, and throughout its whole length the ore, which is fed in at the upper end, is evenly distributed with the heaviest particles nearest the head. By stopping the open lower end with a piece of stick laid across it the current is restored to its original depth, and a new stratum of ore prepared, and so on till the tye is filled, when it is emptied with shovels. The middle portion is put through another tye, and the tail end thrown away. The huddle proper is a low cone, giving on every side an inclined plane over which a thin stream of water runs, and forces along any particle which is not so large as to produce a friction on its hase in excess of the current force. It is, therefore, a classifier, in some respects similar to the tye; so, too, is the Frue vanner or endless belt, presenting a continuous inclined plane to the current. The Spitzkasten is a current separator in which the current enters a hox as wide again, and the current speed is diminished. All particles which do not hottom in this current before it flows over the dividing partition are carried into another hox of increased width and still slower current. In this way a succession of hoxes obtain different classes of equivalent falling particles. The Spitzlutten is an arrangement of hoxes in which an extra current coming in from below each hox prevents anything settling which is not able to force its way against the current.

Jigging is the suspension of the particles in a frame with a wire meshed or perforated plate hottom, and a pulsating action given to the mass hy movement of the frame up and down or by movement of the water. On the theory of falling hodies through water the Germans have elahorated a very refined system based on classifying the various particles in lots of uniform size. The Collom jigs are the latest development of this principle. The water is hrought up against the sieve with force just sufficient to lift the mass, which then in settling down causes numerous ascending currents to pass up through the bed, but becoming split and lessened in force with each particle encountered, until finally only the smallest grain can be removed, and this remains uppermost, the largest particles being below, the small heavy ones having passed down through. The jigging of the old style necessitated stopping the sieve at this stage and skimming of the light waste, then resuming with a fresh charge as hefore. The present style consists in having a current of water flowing continuously over the charge while it is pulsating and carrying the waste material away as tailings. The small ore particles which fall into the hutch heneath are drawn off at intervals as necessary. It is at once seen that this continuous jigger is equivalent to a pulsating action given to the tye, and it is really a matter of surprise that the parallel should not have heen followed further hy having long sieves. This is the distinctive feature most apparent in the jiggers used hy the Cornish miners in South Australia, and which work so splendidly on copper ores in the Moonta and Wallaroo districts. There is, however, another feature which involves a principle hitherto disregarded hy German jiggers. Motion is given to the water by the down stroke of a piston in a side chamher of the machine. To prevent a back suction on the up stroke various devices of valves or traps have heen used, all based on the principle of the Spitzlutten or the descent of particles against an ascending current. In consequence very close sizing is necessary or failure will result, the failure heing principally caused by inability to do anything further with the "middlings" grade of concentrates. This is said to he the cause of some well-known Australian failures. With the Cornish, or it might more fittingly he termed the "Moonta" type of jig, back draught is not only allowed hut actually sought. The explanation is this: Particles passing down through the spaces between larger stones are in reality sinking through a tube. Experiments with tuhes show that if the particle is over four-tenths of the tuhe's diameter, friction hecomes very perceptihle and increases rapidly with any further increase in the size of the particle. When, therefore, hack suction is permitted, the opened hed of stuff is immediately compacted, the larger stones feel the draught first, and, immediately settling down, force up ascending currents from between them until finally brought to rest by squeezing some smaller particle whose weight has hrought it down to that level. The stroke is nearly over by this, and the finish of the current carries small ore down into the hutch, out of the way of the next ascending current of up-stroke. The lahorer in attendance, in case the suction is too strong, simply throws in a few extra shovels of ragging or coarse stuff, or, if too weak, takes a few shovelsful out, and so the work proceeds continuously.

The Moonta "long jigs" are of two types. One, "Hancock's Patent," causes the whole sieve and its hurden to lift, and so produces suction; the other, "Warren and May's Patent," is a piston jig, and the suction is ohtained by dispensing with valves or traps, a modification made by Captain Cowling of the Hamley mine. As to the relative merits of the two types, there is much to he said for hoth. Splendid work has heen and is still heing done by each. Hancock's jig has not been worked elsewhere, but certain modifications of Warren and May's, known as Edwards' concentrator, made by Hawke & Co., at Kapunda, answered splendidly for antimony ores in Queensland, and for tin in the Northern Territory. Hancock's and Warren and May's, at Moonta and the Hamley mines respectively, treat or have treated ahout 1000 tons of ore per week with a loss of only one per cent of ore in the tailings. May Bros. have now a plant at the Silver Queen, in Tasmania, which is hringing to that mine £200 a week profit; and it is well known that Hancock's machine has been able to successfully deal with a parcel of 20 tons of ore forwarded to Moonta hy the Broken Hill Junction Company. The tailings produced contained only one per cent of lead, and the zinc blende was hrought to within three per cent of a separately marketable article. One feature of Hancock's jig is an extra motion given to the jig longitudinally, whereby the stuff is caused to travel the whole length of the sieve even if necessary against the horizontal current of water. Therefore a continuous current of water is not required for moving the tailings along; and heyond the mechanical loss of water absorbed hy the stuff treated, say 20 per cent, the water question is not a very important one. May Bros.' and Hawke's machines use the current and pump the water over again and so maintain their current action. It is apparent that though the machines work on easily understood principles, some intelligence must he exercised in classifying the stuff sent to them and also to the length of the jig corresponding to the amount of stuff to be treated. With almost clean sulphide ores, such as those of the Barrier, it is easy to ohtain very rich "heads," but the "middlings" and "tailings" are practically hut little affected. The Moonta tests seem to show that the shortness of the jigs used at Broken Hill has much to do with this failure. It is, perhaps, not too much to hope that to South Australians must yet he given the credit of showing one way out of the sulphide problem, now so pressing.

The difficulty of ohtaining water at all times has caused recourse to machines which utilize the air instead. Here again the methods may he divided into two hroad classes—hed friction and free falling. The Tierra Seca is an application of the Spitzlutten principle. The stuff passing over a shaking layer of shot, up through which a current of air of measured strength is forced, all heavy particles sink among the rolling shots and work through the wire mesh below. Very successful work was done with a working model at the Adelaide School of Mines. The machine was worked by John Lawson, and the sulphide ore came from the British Broken Hill mine. The Clarkson-Stanfield machine resembles the centrifugal broadcast seed-sower of the agriculturist. In effect it is a circular Spitzkasten, the heavier particles heing thrown farthest outward and sinking as they travel. Partitions can he erected to intercept as desired. Phillips' dry blower, now heing introdnced at Wadnaminga, is in effect a Frue vanner, on whose surface jets of air will operate in place of water.

The rules for calculating falling rates and frictional resistance are the same for machines using air as well as for those using water. Water heing incompressible, any force applied to it can he transmitted without loss; hut air heing compressible, current separation can only he done provided the current is not checked by blocking. If the current he checked at all through hlocking, the air becomes compressed until sufficient pressure is developed to clear the way, which then causes a reflow of current far in excess of requirements. This is one of the practical difficulties in using air. The Clarkson-Stanfield throws the particles through unconfined air, and so preserves a constant friction, varying only with the size and velocity of the particles.

[A coarse canvas belt will save much more of the fine gold than the rubher helt. A canvas belt was used very successfully by one of our old correspondents in 1847. It was called the "Brunton Dressing Frame."

A percussion movement is much hetter than the side or end shake now used by the different vanners. A simple test to show the difference can easily he made with one of Attwood's wooden bateas. After the rotary motion with percussion has heen used, so that the heavy bodies have settled in the center of the batea, raise one side of the hatea and try first a shaking motion. Then with the palm of the hand continue to strike the raised side of the hatea, and the great difference between the two movements will he seen.—Editor.]

The Origin of Gold.

The subject of the origin of gold, or of the manner in which the metal has reached its present positions, is one which has at all times excited considerahle attention, and the number of theories put forward has heen almost as great as the number of writers on the subject, writes Philip Lake, of Cambridge, England, in *Science.*

It is easy to understand the presence of gold in alluvial deposits, for this has clearly heen derived from pre-existing rocks; but the difficulty lies in determining how the auriferous quartz-reefs and other rocks which we look upon as the home of the gold, became impregnated.

Sir Roderick Murchison, from his observations in the Ural mountains, originally held that non-alluvial gold was only found in Paleozoic rocks, and principally in his Lower Silurian, but he believed that it was not introduced into these rocks until shortly hefore the Drift period. Suhsequently he was led to modify these views to a certain extent, and to admit that Secondary and Tertiary strata when penetrated by igneous rocks or impregnated by mineral veins, might also contain gold.

More recent ohservations show that gold may be found in rocks of any age in metamorphic strata; but all the evidence seems to support Murchison's next contention, viz., that gold is of igneous origin.

There is prohably no more instructive area to illustrate this than southern India, where the distribution of gold has been carefully worked out hy Mr. R. B. Foote, of the Geological Society of India. Almost the whole of this part of India is made of crystalline and metamorphic rocks; and in it there are a large number of gold mines, more or less rich. A closer examination of the country shows that we have here a large mass of gneissic and granitoid rock which is crossed by a number of bands of schist, lava flows, hæmatite beds and conglomerates. Mr. Foote has shown that these hands helong to a system which is distinct from, and newer than, the gneiss, and to this system he has given the name of Dharwar. He has also shown that all the gold fields of southern India, with the possible exception of the Wynaad, lie within these Dharwar hands.

As usual, the gold is found principally in quartz-reefs; and it is a remarkable fact that though quartz-reefs are by no means uncommon in the gneiss, as well as in the Dharwar heds, yet those in the gneiss are never auriferous. It is clear, therefore, that the gold cannot have heen introduced into the reefs from helow, for in that case there would be no difference in that respect hetween the reefs in the gneiss and the reefs in the Dharwar.

Only one other possihle conclusion remains, viz., that the gold originally lay in the Dharwar rocks themselves, and that it has since, by some process of segregation, been gathered together in the quartz-reefs.

It has already heen stated that lava-flows occur among the Dharwar rocks; and my own ohservations have led me to believe that many of the schists also are lava-flows. In fact a very large part, if not the greater part of the system, appears to be of volcanic origin.

It may he concluded, therefore, that the gold which we now find in the auriferous reefs of southern India was derived from the rocks of the Dharwar system; and that it was originally brought up from the depths of the earth hy the lava-flows which form so large a part of that system.

THE Russian Government has ordered that its mints shall no longer receive from individuals silver bars or worn silver pieces to be converted into coin, and the importation of silver coin is prohibited. This prohibition, however, shall not apply to Chinese liang, which China may still send into Russia over the frontier. No great significance is attached to the order, as most of the money of Russia is paper and the silver coins are few.

THE Spanish mine in Nevada county which holds the record for cheap mining and milling of ores, has been sold, as will be seen by reference to our summary. The price is said to be $55,000.

MacArthur-Forrest Process

UNITED STATES PATENTS CONTROLLED BY

The Gold and Silver Extraction, M. & M Co.

TRADE MARK.

(MACARTHUR FORREST PROCESS)

DENVER WORKS: On the D. & R. G. R. R., near the Broadway Electric R. R. Depot.

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Among the mills that have adopted the process are: The Denver Mill, Denver, Colo.; The Livingstone Gold Mining Co., Boulder Co., Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; The San Juan Gold M. & M. Co., Silverton, Colo.; The MercurGold Mining Co., Fairfield, Utah; The Union Mills Co., Tuscarora, Elko Co., Nev.; The Creighton Mining & Milling Co., Creighton, Cherokee Co., Georgia; The Moratock Mine, Montgomery Co., N. C.

Experimental tests and carloads of ore treated on request.

Cheapest and surest process yet discovered for treating many kinds of refractory ores

Full information and literature furnished by

T. L. WISWALL,

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is heavily illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cash, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Mechanical Progress.

Accuracy of Touch.

There are plenty of men who will, by the impression carried through a pair of calipers and the fingers' ends, determine, within a very small percentage, the amount of pressure which shall be required to be exerted by a hydraulic press in order to force into its shaft an engine crank or a locomotive driving wheel; a measurement in which a thousandth part of an inch variation in diameter causes much more variation in pressure than is permissible, says Fred J. Miller, in *Scribner's*. Indeed, on some kinds of work done in the machine shops, a thousandth of an inch has now become the most commonly employed unit of measurement; a unit which is divided and subdivided into at least ten parts in order to express the degree of refinement arrived at. This, of course, far surpasses the frequently mentioned hut supposedly superfluous hair-splitting operation, since an ordinary human hair is about two and a half thousandths of an inch in diameter. The paper upon which this page is printed is about three-thousandths of an inch thick, and one ten-thousandth part of an inch is therefore one-thirtieth the thickness of this sheet. Considerably smaller variations of size can be detected by the trained sense of touch, or rather by the variation in resistance of a pair of calipers passed over the work, and it is even possible for the sense of magnitude and the sensitiveness of the finger ends in relation to it, to he so highly developed as to detect, unaided, and by merely rolling a small steel ball between the thumb and finger, a variation of true sphericity amounting to 1-12500 of an inch, or about one-thirty-seventh part of the thickness of the paper of this page; Ambrose Webster, a machinist of Waltham, whose business is the making of machinery and tools for watch manufacture, having demonstrated his ability to do this.

The Ancient and the Modern Gun.

An engineer, after visiting the caravel "Santa Maria," remarked that the little guns of that vessel were silent witnesses as to the limited advance in the science of ordnance, bet bore potent testimony of the advance in the mechanic art. "Here" said the engineer, "is a built-up breech-loading gun; it has a central tube, on which jackets are shrunk (or forced) in short sections; at the joints between these sections there are other iron bands, tightly shrunk. The breech block, which is chambered, contains the cartridge; it is held in place by a key, or wedge. This gun is certified to be a *facsimile* of those actually used by Columbus on board the 'Santa Maria.'

"The difference between this gun and those now being built, and about which we read such interesting accounts, differ in magnitude, not in principle. The molecular strain in a forging or casting of great size led to the abandonment of cast guns and the adoption of built-up guns in our own generation; it seems evident that as the cupolas advanced in size and the molders' art progressed, the cast guns of large size became practicable; but with the increased internal pressures demanded the castings reached their limit, and built-up guns became essential.

"The gun of to-day is composed of a central tube, on which are shrunk 'hoops' in shorter sections; its breech block is held in place by a slotted screw, which is but another form of the wedge, being a circular inclined plane.

"The difference between the guns of Columbus' ships and those of to-day is due almost exclusively to the mechanic arts; to the steam engines as the power; the furnaces, the cupolas, the hammers and the lathes as the tools, and to the brawny sons of toil who work these machines; the advance has been gradual, and is wrought by machanics and draftsmen and the claim that gunnery or that ordnance belongs to the occult science pales before the scrutiny of common sense observation."—American Manufacturer.

The Battle Ship "Resolution."

The great Palmer Shipbuilding and Iron Company is about to complete for the British navy a vessel—the "Resolution"—which divides with the "Revenge" the honor of being the largest and heaviest vessel built on the Tyne. Some idea of her enormous size may be gained when it is said that her displacement exceeds that which was possessed by the ill-fated "Victoria" by about 3700 tons. Her dimensions are: Length between perpendiculars, 380 feet; breadth, 75 feet; mean draught of water, 27½ feet; displacement, 14,150 tons; freeboard forward, 19½ feet, and freeboard aft, 18 feet. The vessel, which is of steel throughout, is constructed on the longitudinal principle, and the hull is subdivided into 220 water-tight compartments.

The heavy artillery comprises four 67-ton breech-loading guns of 13.5-inch caliber, two being located in each barbette. These guns are capable of being trained through an arc subtending an angle of 120° on either side of the center line. The auxiliary armament includes ten 6-inch 100-pounder quick-firing guns, four of which are mounted in armored casemates on the main deck and six on the upper deck, protected by armored shields, sixteen 6-pounder quick-firing guns, nine 3-pounder quick-firers, two 9-pounder field guns, eight 5-barelled machine guns, and seven torpedo tubes, two of which are submerged.

The propelling machinery consists of two sets of triple-expansion engines, each having cylinders of 40-inch, 50-inch and 88-inch diameter respectively, with a stroke of 4¼ feet. Steam is supplied by eight single-ended boilers, each working at a pressure of 155 pounds per square inch. With forced draught, the engines are expected to develop 13,000 horse-power and drive the ship at 17.5 knots, while under natural draught the horse-power will be 9000 and the speed 16 knots. The auxillary machines required for steering, warping, distilling, etc., number 69.

Good Results in Castings.

The Midvale Steel Company of Philadelphia has recently turned out some remarkably large and heavy steel castings. Among these was a frame for a hydraulic riveter, which weighed 23,315 pounds. Each casting measured 26 feet 2 inches long by 73¾ inches wide at the widest part, and the pair weighed nearly 45,000 pounds. Test bars cut from the casting previous to annealing gave the following results: Tensile strength, 89,660 pounds per square inch; extension, 22.67 per cent; contraction, 41.07 per cent. Another large casting was a hydraulic cylinder, the weight of which was 16,594 pounds, and was without a blemish. A test bar cut from the casting before annealing gave the following results: Tensile strength, 92,050 pounds per square inch; extension, 21.20 per cent; contraction, 30.85 per cent.

Punching and Shearing Structural Steel.

Tests to determine the effect of punching and shearing structural steel serve to strengthen the evidence already existing, that up to thicknesses of, say, ½ in., these processes do no greater injury to steel than to wrought iron, says *Engineering News*. This is especially gratifying since the general belief has been until quite recently, and, indeed, is common even yet, that soft steel required to be reamed after punching, or preferably drilled, to develop the full value of its greater strength and ductility for structural purposes. The chief drawback to the more common use of the metal by engineers has been due to this probably more than to any other one thing. The advantage of being able to use the punch for ordinary qualities of structural steel hardly needs to be pointed out. The simplicity, rapidity and economy of the process are all in its favor. Conservative estimates give the relative costs of punching, reaming and drilling as 1, 1½ and 3, and with a given shop area and capital invested in appliance probably at least 10 per cent more material can be prepared by punching than by drilling. The results of the tests referred to would seem to show that the further tabooing of soft steel for this reason is inexcusable and can only be attributed to ultra conservatism and lack of progressiveness. Briefly stated, they show that steel not exceeding 80,000 lbs. tensile strength per sq. in., may be punched up to thicknesses of ½ in. without greater injury than wrought iron. Up to thicknesses of ⅜ in. no advantage seems to he gained by reaming the punched hole, indeed, the advantage seems to be on the side of the punched hole. Beyond this thickness, however, reaming is advantageous. In regard to drilling, the evidence presented is that no advantage is gained over reaming in thicknesses of less than ¾ in.

Hollow Shafts for Steamships.

A point not generally known in connection with the machinery of modern steamships is that all the shafting is hollow. After the shafts have been forged solid, a core, sometimes 6 or 8 inches in diameter, is bored out from the center, leaving a safe amount of metal in annular form for the work required. The reason for this is that a hollow shaft is really stronger as well as lighter than a solid one, and also that the core of a solid shaft often embodies impurities and incipient cracks which may radiate to the surface after long use and cause disaster. The same idea of hollowing out is carried through the entire system, even the crank pins being bored.

Scientific Progress.

Aluminum from Clays.

Lately schemes for cheaply extracting the aluminum from common clay have been worked with great profit. Numbers of these schemes have been brought to the attention of the State Mining Bureau. This statement is from State Mineralogist Crawford's Bureau:

"There are apparently several parties in this State who are working the credulous for capital to extract aluminium from various qualities of clay. It has often been remarked that every clay bank is a mine of aluminium. While this statement is chemically true, it is not true from a metallurgical standpoint.

"The active agent in reducing aluminium to the metallic form is the element sodium—the metallic base of common salt. Sodium has an intense affinity for oxygen, so strong that it will abstract oxygen from its combination with aluminium (the sesqui-oxide of aluminium), and will also abstract oxygen from ordinary quartz—known to chemists as oxide of silicon—leaving the element silicon free. In every clay bank there is both silica and alumina—these representing the oxides of silicon and aluminium.

"Metallic sodium is the only agent that cannot be used in a comparatively economic manner to abstract this oxygen. Unfortunately for these pseudo-aluminium metallurgists, the silicon is also reduced to its elemental form at the same time that the aluminium is being reduced, and the two metals form an alloy which is brittle, and consequently unfit for the uses in which aluminium is applied in the arts.

"No process has yet been devised to free aluminium from this combination of silicon, and it is highly improbable from their similarity of chemical deportment that such a result can ever be achieved in an economical manner.

"It is for this reason that manufacturers of aluminium are obliged to depend for the success of their works upon the use of compounds of alumina which do not contain silica.

"The materials used are the mineral cryolite (a double fluoride of aluminium and sodium) and an artificially-prepared sesquioxide of alumina. These are suspended in a bath of molten chlorides of the alkaline earths and then subjected to electrolysis by powerful dynamos. The sodium salts are decomposed. The metallic sodium seizes eagerly upon the oxygen that was in combination with the aluminium, and as a result the white metal aluminium is freed and settles to the bottom."

Tornadoes.

In an address before the World's Congress of Meteorology, at Chicago, H. A. Hazen, of the U. S. Weather Bureau, said concerning tornadoes:

"Perhaps the most persistent phenomena in connection with tornadoes are the constant and profuse discharges of lightning which immediately precede or accompany them. Balls of fire or globular lightning have also been noted often. Tornadoes are very narrow, seldom over 500 feet, and always move from a westerly to an easterly point. There is a loud and indescribable roar which precedes them, and this may be heard 15 minutes before the tornado strikes, and will generally give sufficient warning. This roar is probably due to a constant thunder and has been heard in a modified way in connection with a severe thunderstorm. The paths are parallel, and distinct tornadoes move along these paths, beginning after the hottest part of the day. Each tornado has a path a little to the southeast of the former. This action may be kept up till after sunset or five or six hours after the hottest part of the day.

"Little careful attention has been paid to the observation repeatedly made that the first appearance is of two clouds, one coming from the northwest and the other from the southwest. This appearance has been greatly misinterpreted at times, as it has been thought that the north cloud, which is cold, has met the warm south cloud. This has given rise to enormous contrasts of temperature, and the terrible conflict between these has developed or resulted in the tornado. It is evident that the meeting of two clouds of different temperature could not produce an unstable equilibrium at all; moreover, the appearance of these clouds all along the line show that they are engaged in a continuous action and do not form a single union, and thereafter move on as a storm. The distribution of debris also shows this clearly. In the center of the track all material, trees, etc., are deposited in parallel lines and look as though propped by a mighty river flowing over the ground. On the south side there is an inclination inward and forward along the line of the storm. On the north side there is a similar action, but oftentimes the trees and debris are deposited in lines pointing to the direction from which the storm has come, showing that in such cases the north cloud acted first.

"The most interesting point which now has come to the front is regarding the occurrence of an enormous whirl, with a diameter equal to the width of the greatest destruction. It has been thought impossible to account for the terrible destruction on any other theory. It is conceded at once that the onward progress of the tornado at 40 or 50 miles per hour could not do serious damage, but if the cloud rotates at 300 or 400 miles per hour all the destruction could be easily explained. Unfortunately this supposition, when properly examined, shows its own weakness. If a funnel whirling at 300

miles per hour should move at the rate of 40 miles per hour, then on the north side the velocity toward the rear would be 260 miles an hour, and in front it would be 300 miles per hour. No such action as this has ever been noted. It is safe to say that there is no such uniformity in the destruction or disposition of debris. This point regarding the whirl of the tornado is the one over which there is the greatest controversy at the present day, and demands the most careful investigation, especially in the line of a study of the debris. The strongest proof of the whirl has been the appearance of the cloud in midair, but a little thought shows that this appearance is most illusory and cannot be accepted in the light of the almost universal records of the distribution of debris."

Scientific Facts.

A ton of sea-water is supposed to contain about 14 grains of gold.

Sixteen ounces of gold are sufficient to gild a wire that would encircle the earth.

Whenever there is friction there is heat. Hammering a nail rod until it is red-hot, or forging a nail without fire, are feats of the blacksmith.

During the last Paraguayan war it was noticed that the men who had been without salt for three months, and who had been wounded, however slight, died of their wounds because they would not heal.

A frog cannot breathe with its mouth open. Its breathing apparatus is so arranged that when its mouth is open its nostrils are closed. To suffocate a frog it is necessary only to prop its jaws so that they cannot shut.

Prof. Virchow reaffirms his belief that no trace of "the missing link" between man and the lower animals has been discovered, either in the human skulls which are believed to be most ancient, or in the physical structure of modern savages.

Among solids, glass is apparently perfectly elastic. A plate of glass bent under pressure and allowed to remain under stress for 25 years, when released and carefully tested for any permanent set, was found to have returned to exactly its original shape.

The Planet Neptune.

September 23d is the anniversary of the discovery of the planet Neptune. This was a great event in astronomical science. The invisibility of the planet to the naked eye renders it of little interest to most people, but to the astronomer the boundary planet of our system is an object of special wonder, says Prof. Orrin E. Harmon, in the Seattle *Post-Intelligencer*. The discovery of Neptune confirmed the Newtonian law of gravitation, and brought fame not only to Adams and Leverrier but to our American astronomers, Walker and Peirce. The researches of Walker developed the fact that the planet had been seen before by the French astronomer, Lelande, in 1795. Peirce believed that the discovery of the planet in 1846 was an accident rather than a result of the calculations of Adams and Leverrier, and his investigations of this theory attracted wide attention. Few names in the scientific history of America are more honored than that of Benjamin Peirce, yet the astronomical world has generally rejected his idea that the discovery of Neptune was accidental.

Reason in an Old Superstition.

The old-time superstitious beliefs that human beings should sleep with their heads toward the north is now believed to be based on a scientific principle. Some French savants have made experiments upon the body of a criminal who had suffered death, and these tests go to prove that each human body is in itself an electric battery, one electrode being represented by the head and the other by the feet.

M.C.Co BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION — JUST OUT.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Electricity.

Repairing Incandescent Lamps.

The manufacture of incandescent lamps has served as an example of the economies growing with the industries. An incandescent lamp past service was formerly deemed as useless, although not as noisome, as an egg retired from active business. The rising price of platinum rendered it worth while for lamp manufacturers to collect old lamps, and to separate and crush the necks, as preparatory to the separation of the platinum leading in wires by washing in a manner comparable to that in which the platinum was originally separated from the natural deposits.

The decision of one of the Federal Courts in the United States sustaining the Edison lamp patent also gave a value to destroyed lamps, as one always has the right to repair a patent article which has come into his ownership; and this repairing of Edison incandescent lamps has become quite an industry. Lamps with broken filaments are perforated by crushing the end of the protruding tip of the lamp, and then revolving it rapidly in a lathe while the end of the lamp is heated by a gas-blast flame until the glass is softened, and the centrifugal force assisted by a former inserted into the orifice, increasing the diameter of the hole from one-twentieth of an inch to about three-fourths of an inch. The remnants of the old carbon are cut away and the inside of the lamp carefully cleaned by special tools. A new carbon filament is attached by electroplating of copper at its terminals to tiny copper tubes, about one-sixteenth of an inch in diameter and three-eighths of an inch in length, which are inserted in the lamp, and the tubes placed upon the projecting copper and platinum which held the filament originally in the lamp. The contact is made secure by means of a pair of nippers which crush the tube with lateral corrugations. The end of the lamp is then softened by heat, and the opening reduced to about one-quarter inch, and sealed to a tube. The lamp is then evacuated and finished in the usual manner. When a lamp bulb has been broken, the glass is cut away at the neck, and a glass tube fused upon it, which is afterward blown, and the carbon filament inserted in the method described. It is estimated, says *Engineering*, that over 10,000 lamps per day are being thus repaired in the United States, consuming not only all the available breakages, but their demands are levying upon stray barrels and boxes of old lamps which have been broken in the past and not thrown away, but stored in sheds and attics in accordance with that prudent New England principle which checks the destruction of anything which may be considered to contain the possibility of possessing a value at some future time.

What is Electricity?

As far as the writer is able to understand the matter now, electricity is simply motion of the different substances which are the subjects of electrical action, just as heat, light and sound are, and the only difference between these forces is the rate of motion, says the *Electrical Review*.

The motion of sound, as we all know, is comparatively slow; that of heat and light very rapid. That electricity would appear to be somewhat between the slow motion of sound and the rapid motion of those heat waves whose motion is slowest.

And it would appear that the wonderful adaptability which electricity shows for every kind of work, is due entirely to the position which its rate of motion occupies in the scale of energies.

It would also appear that the reason this wonderful agent lay dormant for so many ages, and is even now only partially developed, is, very largely at any rate, because we have no sense which responds to the particular periods of vibration comprised within the electrical range.

Heat currents would be far more efficient than electric currents if we could make use of them as we do of the latter; and as before remarked, the reason electricity is such a useful agent appears to be because its rate of vibration is sufficiently high to admit of rapid transmission, yet not sufficiently so to be destructive. It only becomes destructive when it is transformed into heat.

Ocean Telephony.

Dr. Sylvanus P. Thompson, the noted English electrician, considers that telephoning across the ocean is one of the possibilities of the early future. In a paper on this subject before the International Electrical Congress he described a cable which, if used in trans-Atlantic work, would perform the same service now requiring eight cables. In the present cables the slowness with which the insulation around the copper wire changes from low to high and from high to low potential, limits the number of words that can be sent to about 25 a minute, as claimed by the Postal Cable Company. Were the cables made with two wires, one for the outgoing current and one for the returning current, with induction coils connecting the two so as to produce a slight leakage from the outgoing wire, these induction coils, placed uniformly ten miles apart, such a cable would transmit signals so much more rapidly that, in his judgment, ocean telephony would be possible, or, if not, then at least the Morse signals could be sent so much more rapidly that one cable would do what now requires eight.

An Electric Clock.

E. T. Evans, a jeweler of Golden, Col., after nine years hard work and constant study, has invented a clock which has electricity for its motive power. The clock in question has neither weight nor spring, but consists only of three wheels, a pendulum, and only enough power is required to overcome the lost motion of the pendulum. The two electro-magnets are arranged similar to a motor. In starting the pendulum connection is formed on one side, and at a certain angle is automatically cut off again, the pendulum swinging back of its own gravity, and as it passes the center of gravity it makes connection again on the other side, and when it reaches the same angle the current is cut off. The line of contact at each swing of the pendulum is just long enough to give sufficient force to overcome the lost motion. One tooth marks the revolution of every minute, and by a very simple device this wheel is connected with the dial wheels. The advantages to this clock are that it never needs winding, but will run as long as the battery lasts, which is from 12 to 24 months.

Who Invented the Lightning-Rod?

An English Assyriologist recently announced that he had unearthed a furnace thousands of years old, in which the hot blast had undoubtedly been used. Just as this archæologist seeks, rightly or wrongly, says *Industries and Iron*, to deprive Neilson of the credit of his invention, so the German Egyptologist, Herr Heinrich Brugsch, endeavors to prove that Benjamin Franklin was not the deviser, but merely the rediscoverer, of the lightning-conductor, as he claims that he has abundant testimony that the ancient Egyptians used a form of this useful instrument for protecting their temples against discharges of atmospheric electricity.

A New Electric Gun.

The inventor of melinite, M. Tuapin, has submitted to the French War Office an electric gun, which he states is capable of discharging 25,000 projectiles in five minutes, and has a range of several miles. The apparatus is comparatively light weight, so that it can be drawn by two horses and managed by four men. The projectiles are small shells, charged with a secret preparation, spreading death for many yards around.

To Transmit Power.

An important scheme for the transmission of power is now being considered in Switzerland. It is proposed to dam the River Reuse and convey the water to a storage and distributing reservoir having a capacity of 3,000,000 cubic feet, and situated at Combe Garrot. From here the water is to be distributed to the communities of Neufchatel, Loche, and La Chaux-de-Fonds. The head available will be about 300 feet, and the conduits will have a capacity of 177 cubic feet per second, though the flow of the river varies between 100 and 60 cubic feet per second only. The power will be distributed from the turbine stations by electricity, distances being from 7½ to 11 miles.

Useful Information.

Big Pumping Feat.

For 16 months pumps have been at work drawing the water from Lake Angeline, near Ishpeming, Mich., and the water is all gone. The lake lies near the southern part of Ishpeming, covering 160 acres, and was 70 feet deep in the middle.

Under the bed of the lake lie the largest iron ore deposits ever discovered. The ore was discovered some ten years ago, when a diamond drill was set on the frozen surface of the lake one winter and a hole drilled 600 feet down below the bed of the pig iron. Large ore bodies were cut by the drill, and the three mining companies owning the ground under the lake began devising means to secure this valuable ore.

Work was begun last spring before the snow left the ground, when a rotary pump with a capacity of 20,000 gallons per minute was anchored in a barge in the center of the lake and began pumping water into a big flume elevated 20 feet above the surface of the water. The pump has been going day and night, allowing for occasional breakdowns, and the water has only recently been drained all out. Now, however, a serious question remains to be settled. There is a bed of mud from 2 to 40 feet deep over the bed of the former lake. This mud is kept moist by underground springs, from which the water bubbles up. Big tubular standpipes, pierced with myriads of small holes hardly larger than a needle's point, are being forged into the mud, and into these the water filters and is pumped out. The surface of the bed of the lake is more treacherous than quicksand, for any heavy object thrown on it is quickly engulfed. Several narrow escapes from drowning have taken place. It will take 16 months longer to get rid of the mud.

Statistics of Thirst.

There is, at first, something very appalling in the record of the drink consumed in large cities. For instance, the statement was lately put forward at the London Mansion House that the city of London drank every year 45,000,000 gallons of malt liquor, 8,000,000 gallons of wine and 4,500,000 gallons of spirits. The announcement startled the public until an optimistic mathematician brought a little arithmetic to bear on the figures, and forthwith altered their significance.

He found that London has a population of close upon 6,000,000. About 2,000,000 of these are children, who, for the purpose of argument, may be classed as taking no alcohol at all. Also, for the purpose of argument, it may be assumed that of the remaining 4,000,000 2,000,000 are total abstainers, leaving the drinkers of the city numbered at 2,000,000. This would give an annual consumption per head of 22½ gallons of malt liquor, 4 gallons of wine and 2¼ gallons of spirits. Twenty-two and one-half gallons a year is almost exactly half a pint a day; 4 gallons a year would be a very small wineglass daily; 2¼ gallons a year would barely suffice to fill the smallest liqueur glass 365 times. So that the inquiring statistician reached the conclusion that the terrible drink bill of London resolved itself into the fact that the average Londoner takes one glass of beer with his dinner and a very small glass of wine after it, and that before he goes to bed he takes the merest toothful of whisky or some other spirit as a night-cap.—Chicago Record.

Armor Plate and Explosives.

The recent test of the 12-inch nickel-steel armor-plate at Bethlehem, Pa., by Commodore Sampson of the United States Bureau of Ordnance, was a striking example not only of the enormous resistance to rupturing stress in steel plates reached by modern metallurgic methods, but also of the tremendous energy developed by modern projectiles through the use of improved explosives, says the *Engineering Magazine*. The plate was completely penetrated by a 250-pound Holtzer projectile thrown by a charge of 110 pounds of powder, which pulverized the projectile into small fragments upon its impact with the target. The velocity of the projectile at the instant of striking was 2005 feet per second. To gain a better conception of the tremendous energy represented by these figures, they may be reduced to terms of work in foot-pounds. Thus, a projectile of the weight named, moving at the velocity stated, has stored up in it a potential energy competent to the performance of 4,396,910 foot-pounds, or 2198.455 foot-tons. Referring this energy to the weight of the explosive, we find that a pound of the latter must have contained an energy representative of 19.985 foot-tons, or one ounce would represent 1.249 foot-tons. A single grain of the explosive is equal to the performance of 357 foot-pounds of work. These estimates are for net work after deducting losses for windage, friction and resistance of the air.

Curious Freaks of Lightning.

A very singular story is told concerning the vagaries of a mass of globe lightning. A tailor in the Rue St. Jacques, in the neighborhood of the Val de Grac, was getting his dinner one day during a thunderstorm, when he heard a loud clap, and soon the chimney board fell down and a globe of fire as big as a child's head came out quietly and moved slowly about the room at a small height above the floor. The spectator, in conversation afterward with M. Rabbinet, of the Academie des Sciences, said it looked like a good-sized kitten rolled up into a ball and moving without showing its paws. It was bright and shining, yet he felt no sensation of heat. The globe came near his feet, but by moving them aside he avoided the contact. After trying several excursions in different directions it rose vertically to the height of his head—which he threw back to prevent it touching him—steered toward a hole in the chimney above the mantelpiece, and made its way into the flue. Shortly afterward, "when I supposed it had had time to reach the top," the tailor said, "there was a terrible explosion, which destroyed the upper part of the chimney and threw the fragments on to the roofs of some of the adjoining buildings, which they broke through."

How Sea Birds Quench Their Thirst.

The question is often asked, "Where do sea birds obtain fresh water to slake their thirst?" But we have never seen it satisfactorily answered until a few days ago. An

old skipper, with whom we were conversing on the subject, said that he had seen these birds at sea, far from any land that could furnish them water, hovering around and under a storm cloud, clattering like ducks on a hot day at a pond, and drinking in the drops of rain as they fell. They will smell a rain squall a hundred miles or even farther off, and scud for it with almost inconceivable swiftness.

How long sea birds can exist without water is only a matter of conjecture, but probably their powers of enduring thirst are increased by habit, and possibly they go without water for many days, if not for several weeks.—Golden Days.

Railway Earnings for Six Months.

Railway earnings in the United States for the six months ending June 30, 1893, show increases in both gross and net, according to statistics covering 121,173 miles, or 69.2 per cent of the total mileage of the country, collected by the *Financial Chronicle*. The results of operations for the six months is given as follows:

	1893	1892.	Inc. P. C.
Gross earnings	$488,662,810	$423,542,661	3 53
Operating expenses	311,811,013	297,978,698	4 60
Net earnings	$126,821,797	$125,563,963	1.00

Classifying the roads by groups, it is found that four—the New England, Trunk lines, Northwestern and the Pacific—exhibit decreases in net earnings varying from 5.37 to 1.28 per cent, all others showing increases over the corresponding period of 1892. The largest increase in net is shown by the Middle Western group—14.49 per cent. It is to be remembered in considering these figures the present business prostration did not begin until after July 1st, so that its effects are not felt to any great extent in railway earnings of the first half of the year. At present earnings are showing large decreases.

Big Steel Wire Cable.

One of the largest steel wire cables on record, having a continuous length of 4½ miles, or one mile longer than a similar cable which was manufactured a few months ago, has just been completed by the Globe Works, Bankhall, Liverpool, England. The total weight is over 25 tons. It is 3¼ inches in circumference, and is made upon the Lang's patent principle, with 42 wires of No. 10 standard wire gauge of the finest quality of improved patent crucible steel wire, the tensile strain of the cable exceeding 45 tons. The facilities of the firm are such that the whole work, from the commencement of the drawing of the wire to the completion of the cable, was carried out within 14 days, although there were over 220 miles of wire used in the manufacture, the machinery for such heavy work being of special design. The cable is to be used for endless haulage and to transmit loads of 40 to 60 tons at a speed of eight miles per hour.

Cleaning Asphalt Pavements.

The block system as applied to the cleaning of the asphalt paved streets of Buffalo, N. Y., is an eminent success, says the *Commercial* of that city. This block system, however, is really only supplementary to the general cleaning system in the business part of the city, and is intended to gather up all droppings, scraps and refuse scattered between regular cleanings. A man or boy now uses an iron scraper to gather into piles the refuse, and from there it is regularly taken up by carts. The present force numbers 49 men, at 15 cents per hour, with six carts. Hereafter the dirt is to be placed in special barrels instead of being gathered into heaps, and these barrels will be emptied by carts as fast as they can make their rounds. The proposed system is practically the London dust-bin and sweeper system long in use in the busier streets of that city.

KENDALL'S PATENT QUARTZ MILLS

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past 14 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that is claimed for it and give entire satisfaction.

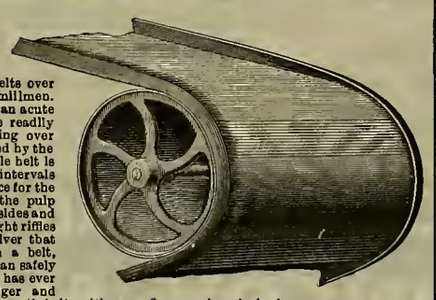
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Coast Industrial Notes.

—German and English stockholders are looking over the Southern Pacific lines in California. The placing of the new loan called them here.

—The Idaho Commercial Company, at Weiser, failed last Friday. Assets $60,000 and liabilities $40,000. The company did a hanking and mercantile husiness and was a leading concern.

—The Davie Ferry and Transportation Company's opposition line hetween San Francisco and Oakland has absorhed the Whitney Express Company's hay steam line and express husiness.

—The Northern Pacific Railroad Company have let a contract to John Nolan for filling under remaining bridges on the Pacific division at a cost of $35,000. The road is being put in shape for faster time.

—The San Francisco city architect is preparing plans for a new huilding to he erected on the grounds of the City and County hospltal. The new structvre will cost $20,000, and will be a dormitory for the nurses.

—Homer Laughlin, an Eastern capitalist from Liverpool, O., is at Oceanside looklng over the headwaters of the San Luis Rey, with a view of takIng the water to supply the city and the surrounding lands. The city offers a honus of $30,000.

—A large proportion of the surplus cattle of Eastern Oregon will he shipped to Omaha this fall. Fifteen thousand head have been hought in Malheur county for shipment to that point, and ahout the same amount in Umatilla and Morrow counties.

—There is pending hefore the trustees of Watsonville an ordinance fixing an annual license of $50 per annum on sewing and washing machine agents who have no fixed place of business, and a license of $10 per day and $250 per month on hohhy horses.

—The Government hoat Seizer is thornughly opening the channel of the upper Sacramento for free service for the nsual run of river steamhoats, removing all snags, opening the hars to a wide and deep capacity, and placIng wingdams to control the current where needed.

—Governor Hughes has appointed the following Arizona delegates to the Southwestern Irrigation Congress, which will meet in Los Angeles Octoher 10th: Edward M. Boggs, Tucson; Dr. S. M. Hurley, Florence; Jerry Millay, Phœnix; I. L. Vauderworker and L. A. Hicks, Yuma.

—Alhert Dihhlee, for many years president of the Giant Powder Co., has resigned and Mr. Elliott M. Root of Sanderson & Root has heen elected to the position at the head of the big explosive corporation. Increasing years and continued ill health were the causes of Mr. Dibhlee's leaving the presidency of the company.

—All work has heen stopped on the San Diego and Phœnix railroad. The main cause is attributed by President Reed to the apathy of the people of San Diego. He recalled the magnificent offer of one prominent capitalist, who offered to subscrihe as much cash as any one of a dozen men, and who, when the time came, hacked up his word to the extent of $5.

—It is alleged that a hrick trust has heen formed in San Francisco. All the principal yards hereabout have heen taken In. There are those of the San Jose Brick Company, the Remillard Company, the Fortln, the Peterson Company, and the yards of Sreishman. It is said that others also are In the combine. The prices fixed upon are $9 a thousand for hard hrick and $8 for the red.

—The San Francisco Fire Department has recommended an award of the followiog contracts: For furnishing 2½-inch hose he awarded to Harry T. Hart at 80 cents a foot; that for 3-inch to W. T. Y. Schenck at $1 30 a foot, while it is proposed that Main & Winchester he allowed to furnish the harness needed in the department for $99 for a douhle set, $66.50 for a single set and $60 for a huggy harness.

—The Oakland, San Leandro and Haywards electric line has asked for a franchise from the Alameda county supervisors from the San Leandro road southerly on Fruitvale avenue to a point 100 feet south of the Southern Pacific railroad track. The Highland Park and Fruitvale road has already a franchise over this territory. The supervisors will receive bids for the proposed franchise till Octoher 30th.

—There is talk in San Francisco of the consolidation of the principal cahle railways, with a capitalizatlon of $16,000,000. The roads reported to have agreed on consolidation are the Southern Pacific's several street car lines and the Howard street, Third and Montgomery, Post, Ellis, etc., cahle lines of the Omnihus system, Fourth and Kearney, and the Market-street horse cars of the North Beach and Mission.

—Some idea of the extent to which sturgeon fishing is to he engaged in on the Columhia river this season can he formed from the fact that 60,000 large stnrgeon hooks recently arrived at Portland from Scotland were all sold hefore heing unpacked and orders placed for 80,000 more. One fisherman ordered 30,000 hooks. Hooks are placed 14 inches apart on lines suspended a foot from the hottom of the river, no halt heing used.

—Capitalists have recently interested themselves in the superh hituminous rock deposits of San Luis Obispo county. They possess improved methods of handling and preparing the rock, and they own tramways, wharves and vessels, either in actual use to-day or in course of construction. The action of these gentlemen is directing the attention of contractors throughout the State to the importance of the San Luis Ohispo bituminous rock industry.

—D. N. Rideout of Marysville has resigned from the presidency of the Mercantile Lihrary, and it is said that Edmund Tauzsky, the lawyer, will he elected to fill the vacancy. The finances of the assocation are very low and the expenses exceed the income hy just $350 a month. That amount is the interest paid monthly on $65,000 horrowed from the Hihernia Bank to complete the new huilding. It is proposed to estahlish a hranch lihrary down town.

—Fire was discovered in Vair's tinsmith shop, at Kameloops, B. C., ahout 4 A. M., Sunday. The following places were destroyed: Vair's tinshop; Prior & Co., hardware; Stephenson, jeweler; Simmons, contractor; Duhammel, harher; Whittaker's law office; Fortune's store and dwellinghouse; J. A. Mara's residence; Sinclair's fruit store; Quinn, hoots and shoes; Chong Lee, general store; Kwong On Wo Co., and five other Chinese houses. The loss will exceed $100 000; Prior & Co's loss heing estimated at $50,000.

—The Pacific Mail Steamship Company has heen permitted hy the Postal Department to annul their contract for carrying the mails hetween this port and Panama. This action was taken hy the steamshlp company hecause it wants to meet as a free lance on the seas the North American Navigation Company. The annulment takes effect on the 30th of this month. The Pacific Mail received $1 per mile for carring the mails. Hereafter the postal officials will share the work between the North American and Pacific Mail companies.

The Midwinter Fair management has decided to award contracts for the Manufactures and Lihera Arts buildIng and for the Mechanical Arts huilding. Smilie Bros. secured the hig structure for $107,300. R. P. Hurlhurt was awarded the Mechanical Arts at $64,400. Each of the contracting firms agreed to take hack the huilding at the conclusion of the fair in part payment of the price. Smilie Bros. will allow $7500 for their strocture. Thls will reduce its actual cost to $99,800. The return valuation of the other huilding was deducted from Hurlhurt's hid, which is $64,400 net.

—The capitol commission of the State of Washington advertises for plans and designs of a new capitol, to he suhmitted by Decemher 14, 1893. The said huilding is to he fireproof, and to he huilt of stone, hrick, iron or steel as far as practicahle, and to he equipped with the most approved methods of heatlng, drainlng and ventllation. The entire cost of the building complete, including all fixtures and appliances, ready for occupancy, shall not exceed the sum of one million ($1,000,000) dollars. The architect suhmitting the hest plan shall he chosen as official architect. Second. third and fourth prizes of $1500, $1000 and $500 respectively are offered.

—Moore & Smith, one of the oldest and largest lumher firms in San Francisco, gave notice recently that they were unahle to meet their engagements, amounting to ahout $600,000. The Kings River Lumber Company in Fresno county and the Port Discovery Mill Company, which are both incorporated with the parent institution of Moore & Smith, are involved equally in the emharrassment. The principal creditors are: The Bank of British Columbia. which stands in for $160,000; Alfred Borel & Co., $220,000; Bank of California and others for various amounts aggregating the halance of the $600,000. The greater part of this is fully secured.

—The Veteran's Home Assoclation has let the following contracts for construction of various huildings at Yountville: Carpenter work—Dining-room and kitchen combined, Leiter & Prugh, Oakland, $8717; commaod. ant's house, H. E. Jones, Oakland, $3650. medical director's house, H. E. Jones, Oakland, $3280. Painting—F. M. Farwell & Son, Oakland, $1646. Plumhing, steam and gas fitting — Diningroom and kitchen, P. F. Ward, San Francisco, $250; commandant's house, J. T. Cosgrove, San Francisco, $336.50; medical director's house, J. W. Ruddock, San Francisco, $315. Tinning—On medical director's and commandant's house, J. T. Cosgrove, San Francisco, $75; dining-room, J. W. Ruddock, San Francisco, $100.

—"We have just been awarded a contract to straighten out the circuitous channel at Twenty-one Mile slough, on the San Joaquin river," said President McMullen of the San Francisco Bridge Company to a reporter the other day. "It is a sequence of the work we have heen doing in the neighhorhood of Stockton, and will go far toward straightening out the tortuous channel of the San Joaquln hetween San Francisco and that point. The present contract contemplates a cut of ahont 3700 feet, and will involve the removal of fully 200,000 cuhic yards of earth. The cut will he 24 feet wide, and will give the tidal water a chance to act upon the depth of the new channel. We are figuring on 8¼ cents a yard for the work."

—The California rail freight movement this season is much larger than at a corresponding date last year. The cars go East laden with canned goods, drled fruit, heans, sealskins and the like. The salmon pack has hegan to arrive from the north, and is helping to swell the volume of husiness. The Southern Pacific and Atlantlc & Pacific lines are taxed to their utmost to handle the business offered. The shipments aggregate more than 150 carloads a day from the northern part of California. Of deciduous fruit alone 709 cars were sent east via Ogden during the first 15 days of the present month. Wheat is piling up rapidly at Port Costa and Stockton, the receipts aggregatlng not less than 200 carloads a day for the two places.

—The Treasury Department at Washington gives the following as the value of the exports of hreadstuffs for the month of August from Pacific Coast districts: Puget Sound, $31,167; San Francisco, $2,271,456; Willamette, $162,299; total, $2,464,931. Barley shows a decided increase in the exports, heing more than three times the amount exported in August of last year. Corn shows a decrease. Oats have gained handsomely and so has wheat, hut the exports of wheat flour have fallen off. From the San Francisco customs district the figures, as compared with those of last year, show great gains in the exports of cattle and heef products, hut hogs and hog products show a decided decrease. Dairy products are also among the exportations which have fallen off, though on the whole provisions have gained.

—Two cottages for girls and a school and a girls' industrial huildlng are to he erected at Whittier, and plans and specifications and hids are asked for. Blds will he received as follows: For doing the carpenter work and furnishing the materlals therefor; for doing the mason work and Iron work and furnishing the materials therefor; for doing the plaster work, including lathing, and furnishing materials for such lathing and plaster work; for doing the plumhing and gasfitting work, and furnishlng materials therefor; for doing the tlnning and galvanized iron work and metallic-roofing work, and furnishing materials therefor; for dolng the painting work and furnishlng materials therefor; for doing the electric work and furnishing the materials therefor; for doing the heating work and furnishing the materials therefor. All bills must he sent to the secretary of said Board of Trustees, Dr. Walter Lindley, at Whittier, Cal., hefore 11 o'clock A. M., Monday, Oct. 16, 1893.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patcut Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ROCK FROM THE MAYFLOWER. — Amador *Ledger*, Sept. 15: The mill on the Bnnker Hill started op on Thursday morning on rock from the Mayflower shaft. The people of Amador City and vicinity are delighted with the prospect of the Bnnker Hill putting on a large force of men.

B. F. Taylor, of the Argonaut, has six men at work on that property building roads and attending to other preliminary work. They soon will have an engine on the grounds and commence work on the shaft, which has already been located.

Work is being poshed forward in the Clinton Consolidated with pleasing results. They have jost struck the so-called "old man" ledge in the 700-foot tnnnel they have been working in for some time. The ledge is about 300 feet below the sorface and prospects well.

At the bottom level of the Gover, aboot 1000 feet vertical depth, a ledge of qoartz bearing $20 rock was encountered, on which they are drifting each way. Soperintendent A. B. Call has ordered timbers for 500 feet of ahaft, the company having concluded to sink 500 feet more, at the ssme time keeping their mill running. The managers of the mine propose to snbstitute their hoisting machinery with electric appliances in a short time. The remarkable success of their electric pump has been so satisfactory that they feel satisfied that electric machinery throughoot the mine will be a grand stroke of economy. A drain tnnnel, driven from the mill site to the shaft, will strike the ahaft 131 feet from the mouth, thus saving the last lift of water and allowing the snrface water, that was so annoying last wioter, to ron off from the mine. Their electric pnmps now have a capacity of 234,000 gallons per 24 hours, and with the addition of another pump and a larger dynamo, this capacity will be doubled. One pump is now at the 200 and the other at the 500 level. When the new pomp arrives, which, by the way, will be the largest electric pump in operation, it will be placed at the 500 level, the larger of the two old ones at the 800 and the small one at the 1000. In driving the drain tunnel a short time ago, a ledge of quartz was encountered, about 500 feet from the ledge in the shaft, which prospects very well. In truth, the Gover seems to have reached an era of prosperity for which its owners and managers have striven for years.

Butte.

THE HORSESHOE.—Oroville *Mercury*, Sept. 13: N. F. Campbell, who has been at work all summer at the Horseshoe mine, on the Little North Fork, is in town. He informs us that there are now abont 35 men employed there. This mine, which is being opened up solely by the capital and enterprise of C. E. Ertz, late of Boston, is sitnated some six miles east of Merrimac, on the Little North Fork of Feather river. The river at that point makes a sharp hend almost in the shape of a horseshoe. Owing to the roughness of the country, this hend has never been worked. Mr. Ertz has now run a tunnel through the neck of land at the heels of the horseshoe which will enable him to lay dry the hend nearly a mile in length. The tunnel is about 150 feet long, and a head dam has been put in, the water being conveyed to the mouth of the tunnel throogh about 200 feet of flume. The tunnel is eight bv ten feet, and in the 150 feet has a fall of over 70 feet, so that it will carry a vast volome of water. The tunnel is now completed and the water has been torned in. A long line of ditch and flume is now being bnilt to wash a har in the river which has been laid bare. As the river above and below has heen very rich, Mr. Ertz confidently expects to he well repaid for his expenditure of time and money. As the season is pretty well advanced, it is probable that active mining will not commence nntil next season.

Calaveras.

MILL RUNNING.—*Mountain Echo*: The mill on the Jooes mine is ronning steadily, crnshing ore from the lower levels. The fact that 20 additional stamps are being put in the mill strongly indicates that the ore is good and the business prosperous. If there is any gold in a mine, Mr. Roberts, the superintendent, knows how to get it out as cheaply as the next man.

AT THE BOLITHO.—*Mountain Echo*: The Bolitho mine, situated between Carsons and Angels, owned by Osborn & Hardy, may now, with safety, be ranked amoug the leading qoartz mines of Calaveras county. It is tapped by three tunnels at different points, one of which is in 165 feet and taps the mine at a depth of nearly 200 feet, where the vein or lode is 40 feet wide, and, hy a thorough milling test, yielded a fraction less than $4 per ton. In addition to which there are a nomber of small veins which are immensely rich and carry sulphnrets of a very high grade. The larger vein also carries a large per cent of sulphnrets which prospect well.

Humboldt.

COAL, BUT NO MONEY.—Bloe Lake *Advocate*: The coal recently discovered on the place of Mr. David Powers near town is said to be of a good quality; bot Mr. Powers declares it impossible for him to work the mine on account of lack of means. A force of men were engaged in working on it lately and attained a depth of 30 feet, but they abandoned it, as the vein is too deep. The ledge of this coal, which possibly runs all throngh that little hill from Glendale to Korbel, is between 200 and 300 feet deep. If a company had charge of the mine, it might he possible that satisfactory results would

be reachsd. But for the pressnt, the mine will remain in its nndeveloped stats.

Mariposa.

STRUCK A POCKET.—*Gazette*, Sept. 16: Messrs. Hope & Sample, of Black Bart mine, unearthed a pocket of about $3000. This mine has yielded some very rich pockets.

Nevada.

THE MISTLETOE.—*Tidings*: Mr. G. C. Haskell, one of the owners of the Mistletoe mine, which is near the village of Rough and Ready, reports that the shaft is down only 30 fset, hut several profitable clean-nps have been made. He thinks it will prove a good property, and that there are several other paying ledges in that locality.

MINES TO START.—Grass Valley *Union*, Sept. 14: P. F. Lillian, superintendent of the German mine, was engaging a gang of men at the county seat yesterday to begin operations in that mine. A new 10-stamp mill was taken to the gronnd by wagons. The German is sitnated about three miles north of Eureka on the river, and is a very promising property. Capt. Webber will begin operations on the Ynha mine this week. The Ynba is situated in Washington district. Mr. Wehher is a wsll-known captalist and an experienced miner, and when he takes hold of a mine it generally pays.

A NEVADA CITY MINE SOLD.—*Transcript*, Sept. 16: One of ths sales which has been on the tapis for a fsw weeks psst was consummated Friday. The Spanish mine, which was owned hy A. R. Lord and A. S. Lord, was sold to Colgate & Co. of New York. It is said the price paid for the property was $55,000. A. L. Beghie, one of the most experienced miners on the coast, was placed in charge of the property Saturday morning. It is nnderstood that new machinery will at once be erected and the mine worked upon a large scale. In addition to this mine, Colgate & Co. are working another mine near the Spanish which bids fair to be a good one.

We learn that Schuster & Co. of San Francisco, who recently purchased the McCoy property near the Spanish mine, and known as the North Merrifield, are making arrangements to work this property for all it is worth. As an evidence that the North Merrifield will be worked on a large scale it is only necessary to state that the new owners of this property are the largest stockholders in the Champion and they do not believe in simply scratching around a mine.

THE MOEILE.—*Telegraph*: The Mobile mine is situated between the Enreka ground and the Spring Hill. Some work is now beiog done on the Mobile and the prospects are a great deal more than flattering. One of the owners was offered $1500 for his interest in the ledge and the offer was refnsed. What little work that has heen done on the propertv is said to have developed a very fine ledge which shows gold freely. Mons. A. Ganthier and Wm. Dihble own the ground.

BEING OPENED UP.—Nevada *Telegraph*, Sept. 15: Messrs. Fricot and Cbavanne have hegun active mining operations aronnd Grass Valley. They are now having a tunnel rnn on the Independence, situated east of the Maryland. The Independence is the extension of the Maryland, and it is thought that tbe tunnel will tap the ledge in a short while.

The same gentlemen have commenced work on the Fair Play mine. The Fair Play is located on the Colfax road, not far from Joe Bonivert's ranch. The property was owned by Mons. Jnles Fricot, and he did the only work on it abont 18 years ago.

Orange.

A COAL MINE.—Orange *Post*: For a number of years coal has heen mined on a small scale in the hills up the Santiago creek. The smallness of the vein, the indifferent quality of the coal and the distance from railroad transportation have operated against the development of the mines. Bnt considerable activity ie displayed at the present time in the mines owned and operated by Supervisor Yoch and T. Harris, perhape others. These mines are situated north of the creek in a little side canyon three or four miles ahove the picnic gronnds. The vein of coal is abont eighten inches thick and could not he mined at all were it not set on edge at a comfortable inclination for work. There are ten men at work heeides the snperintendent and they take out ten tons of coal per day at a cost of ahont $2 per ton. The work is done by contract, the men doing all that is necessary to keep the tunnel clear so as to deliver the coal ontside. Little timhering is needed on account of the strata of rocks and coal standing on edge. Althongh the vein of coal is thin, it extends across the hills five or six miles; while the qnality is not the hest, it makes a fair fnel and helps to keep down the prices on other coals; notwithstanding the output is small and the wages moderate, the indnstry enahles a number of families to get a living beeides affording a modest retnrn on the investment for the owners of the mine.

Placer.

PEOSPECTINO A LEDOE.—*Herald*, Sept. 16: Cal. McCnllough and Oliver are prospecting a ledge a short distance above Greenwood in El Dorado county. The vein is seven feet thick and at a depth of 18 feet they have struck rock that shows gold all throngh it. McCnllongh had a specimen in Auburn yesterday that was beautiful to look at.

Plumas.

ACTIVE OPERATIONS.—*National Bulletin*, Sept. 15: On Monday the directors of the Qnincy Mining and Water Co. met in San Francisco and elected Chas. R. Thompson of Spanish Ranch assistant enperintendent. A. B. White of San Francisco is the general superintendent. Active operations will begin at once on the ditch recently purchased of the Plumas Mining and Water Co. It will be placed in repair as speedily as possible. We congratulate the new mining company upon its selection of Mr. Thompson for assistant superintendent. He is a gentleman of practical experience in mining, and will nse his ability and energy in the service of his company.

San Bernardino.

A FIVE-POUND NUOOET. — Mojave, Cal., dispatch, Sept. 14: The gold excitemsnt which has been on here in this vicinity for the past three months reached a climax this afternoon when a party named Reed, who has a placer claim at Red Rock canyon, abont forty miles east of here, arrived with a nugget weighing five pounds. It is a beanty, and an old mining expert hsre claims it will assay the finder $1000 worth of free gold. This makes the second nugget found in the placers dnring the last six weeks, the last one weighing over two ponnds and netting ovsr $400. Parties are going to the fields daily and it is the opinion of old miners that mnch richer mines will be discovered soon.

San Diego.

RICH FIND.—A lstter received from Rob Weyms. who is now at Julian, says the San Diego *Union*, states that a most important new find was discovered in the Ella mins by Sid Wilcox. Wilcox, it appears, had occasion to remove some dirt ten feet from the mouth of ths lower works, when his pick struck into decomposed rock. The rock proved to be rich, a low estimate heing $20 to $25 per ton. The vein strnck is fully three fest wids. Wilcox and others have for years been working within 10 feet of this rich hody of ore. In their work they have run a tunnel 600 fest long, and as now appears have been paralleling the rich vein. They will now crosscut the old works to reach the new rock. The mine is conceded to be the richest in the Jnlian region.

Shasta.

FROM IGO.—Cor. *Democrat*, Sept. 13: Messrs. J. Rings and Hnbbard are at present taking ont fine gold ore which assays $200 per ton, and they have quite a large amonnt in sight to stope out. It is all shipping ore, so the boys will make a shipment in a few days to the Selby works.

Gillon and Dnnham are running a long tnnnel on their mine and are in on the vein 110 feet, and have strnck some fine ore which looks good and prospects in fres gold by the hand mortar. They expect to run the tunnel 500 feet bsfore they get to the shaft they have sunk on the mine, which prospects in gold and silver and is high-grade ore.

Mr. E. Ballou is running his mill on the rock he is taking ont of his mine, which is good ore. He is milling it by the roasting and leaching chlorine gas process and is satisfied he can work the gold ores of Sonth Fork district satisfactorily, which will help the gold ledge miners of South Fork and the gold bugs ont.

FROM SOUTH FOEK.—Cor. *Democrat*: The miners of Arbuckle district are making extensive preparations for a winter'e run. The Peg Leg or Snyder ditch, some 12 miles long, is being pnt in order.

The miners on Ronnd Bonlder creek are also getting things in shape for a winter's rnn. A party of Chico prospectors have found several ledges on Brown's creek, lying west of Bullychoop.

Hart's mines at Bnllychoop have been in full hlast for npwards of two weeke. The cyanide process proved a complete failnre and has been abandoned. The ore is being wet-crnshed, run over platee and the concentrates piled up, waiting for the completion of the wet chlorination plant.

At Sunny Hill the Bells are etoping out an ore chnte extending some 200 feet deep from the enrface. The ore sacked runs $450 per ton in gold.

The Joe Davis property ie also being worked hy Sacramento parties. The late run with the Huntington mill gave unsatisfactory resnlts and a stamp mill is to be snbstituted for it.

J. A. Lawrence has a bond on the Doll and Smith gronp for 30 days, and expects to float them in Sacramento.

Ballon's wet chlorination mill is jogging along smoothly, working gold ore, while the McMahon & Reed mill at Robinson's is crushing Crystal silver ore and shipping the concentrates.

Marley & Jaegel have their 5-stamp chloridizing and amalgamating mill running on silver ore.

The Dobelin placer claims, aggregating some 300 acres, are abont to be purchased by San Francisco parties.

Tuolumne.

AT COLUMEIA.—Cor. Sonora *Democrat*, Sept. 15: Frank McKenna, superintendent of the Dnnmore, Bnzzard's Roost and Blasted Hope mines, a gronp of promising properties helonging to Otto Kanig and a syndicate of Dntch capitalists, was in town this week. It ie proposed to increase the capital stock to the amonnt of $10,000. Among the improvements contemplated are a new ten-stamp mill with concentrators, also the erection of a new dam across the river. It is also the intention of the company to pnt in an electric plant below the dam, all the machinery to be rnn hy electricity. The company will also furnish light and power to the towns of Gold Springs, Pine Log and Columhia, and may also extend their wires to Sonora. The power at their command is ample to supply all present and fntnre demands.

Louis Dondero has recently opened up a very rich sink of gravel on his claim at Knickerbocker Flat. Marvelous stories are in circnlation regarding the richness and extent of this new development, but it is impossible to ascertain the full particulars.

Jas. H. Bourland & Co. of Martinez are at present trying their new gold-saving machine, which is designed to catch and concentrate the fine flour gold and other metals which flow away in the tailings, water and slimes from both placer and quartz mines. They have jnst put in a machine in Dondero's and Bosovich's flumes, and also another below the quartz mill on Sawmill Flat, owned by Messrs. Conlin & Graham. The process followed is simple and entirely new, as compared with other machines designed for the same pnrpose.

Miss Winchester has snspended operations on her mine, hut will probably resume work at an early date. She has opened np a hody of gravel which looks very promising and prospects as well.

ARIZONA.

PRESCOTT NOTES.—*Journal-Miner*, Sept. 13: J. R. Liston, who has been in Prescott for snpplies, left for home this morning. He says that the Del Pasco mill is running 12 honrs per day with good snccsss.

C. L. Hnbbs, formerly of Albnquerqns, is engaged in dry washing placer gravel bstween Copper Basin and Sknll valley. He is said to have a machine which gives good results in separating the gold from the gravel.

Brown Brothers have bsen awarded the contract for erecting a 20-stamp mill on the mining property recently purchased by the Hsnrietta Mining Company, in Big Bug district. The price agreed npon is $20,000.

The mill of the McCabe Mining Company, it is said, was started up a few days since and is working satisfactorily. This makes four mills now in opsration in Big Bng district.

Work is progressing rapidly on Dr. Miller's mill, at the Westlake mine, four miles south of town. He has the machinery in position, and expects to start up the mill in abont ten days. Dr. Miller has kept steadily at work for three or four years developing this claim, and snccess is now within sight.

OLD DOMINION AT WORK.—Globe *Silver Belt*, Sept. 9: The Old Dominion Copper Co. resnmed work on Friday of last week, with full shifts at mine and smelter. Coke has been coming in rather slowly this week, bnt thers is a very large quantity en ronte from Wilcox, and the bins at the smelter will soon begin to fill up. No further interruption of work expected.

NEVADA.

White Horse District.

RICH SAMPLES. — Wadsworth *Dispatch*: A *Dispatch* rsporter who has livsd in a mining oamp nsarly all his life and who has seen a grsat many rich specimsns, saw the equal of the best of them among some samples of gold-hearing quartz which David Washeim brought in from White Horse the other evening. It was pure virgin gold like the yellow gold of California and was in the quartz in such a manner that it seemed that if the rock could be sliced off there would be a sheet of gold as thick as a twenty dollar piece. The find ie in a different direction from the trend of the ledge of the Jim Blaine and proves moet satisfactorily that there are a nnmher of ledges in the district and that White Horse is assnred of permanency.

OREGON.

HYDEAULIC MINE.—Browntown Cor. Rogne River *Courier*, Sept. 14: The Illinois Hydraulic Mining Co. is the firet incorporated hydraulic company in this section of Josephine conuty. It is a Portland company with Capt. Geo. A. Pease, president; E. E. Lawrence, secretary; and H. L. Doney, superintendent of works. Their property consists of some hnndred and sixty acres of gravel deposit on Bollen creek and McDonner gulch, to which they have brought water in ditches, and from the known richness of this section in the past there is a bright ontlook for the fnture. They are now working some six men and will eoon commence opening a new trail to connect with the Browntown trail and postoffice.

TO WORK A MINE.—The Columbia Mining Co. of Grant's Pass have filed articles for the purpose of working the Anaconda mine, sitnated in Applegate district, in Josephine conuty. The amonnt of the capital stock is $100,000. Allen Nevin, A. C. Taylor and Robert Smith are the incorporatore.

PROMISES WELL —Jacksonville *Times*: A quartz ledge has been discovered on one of E. E. Miner'e farms in Gold Hill precinct, which promises very well. It is eix feet wide and grows richer and ie better defined as development progresses. Some of the ore taken from the ledge at a depth of 30 feet was sent to the celebrated Selby Smelting Works of San Francisco, and assayed at the rate of $14.50 per ton. As this mine is located in one of the richest mining districts of southern Oregon, Mr. Miner naturally feels highly elated.

PLACERS ON POWELL'S CREEK.—The Grant's Pass *Observer* says that rich placers are being worked on Powell'e creek, a tributary of Williams creek, in Josephine conuty. There are already 18 claims located on the creek, which cover a distance of ahont five miles and leave abont three and one-half miles farther np the stream yet vacant. There seems to be a rich har at the bottom, which is from 16 to 35 feet wide and very rich. This pay chnte does not seem to have any direct course, hnt runs in all directions along the creek bed. From $4 to $8 per day for each man with pick and shovel has been realized this snmmer from some of the mines. Powell's creek furnishee water the year ronnd. Bedrock is reached at a depth of from two to eight feet, and the ground is easily worked. The gold fonnd is coarse.

WASHINGTON.

A COPPEE FIND.—Ellensburg *Capital*, Sept. 14: Thomas Johneon came down on Tnesday from the divide between the Teanaway and Ingals creek, bringing with him abont 100 ponnds of probably the richest copper ore ever fonnd in the northwest, and fnlly eqnal to the Lake Superior prodnct. It rune from 85 to 90 per cent copper, 30 to 40 ounces of silver, and abont $10 in gold. The best Lake Snperior copper averagee abont 89 per cent. This discovery was made by Cle-Elnm parties a short time ago and they asked Mr. Johnson to examine the find for them.

The Correspondenoe Sohool of Mines, Soranton, Pa.

Ques. What is the Correspondencs School of Mines?

Ans. It is an sducational institution intended to meet ths wants of Mine officials, Minsrs and othsrs interested in Mining who cannot afford ths time to quit work to attend a regular technical school in ordsr to obtain the education which they nesd. It tsaches ths theory of Coal and Mstal Mining and the sciences related thsrsto by correspondsncs.

Ques. What are the branches taught?

Ans. Arithmstic, Search for Coal and other Minerals, Ventilation, Methods of Working, Mine Survsying and Mapping, Mins Mechanics, Mechanical Drawing, First Aid to ths Injured, Mins Legislation, Mins Accounts, Blowpiping, Mineralogy, Assaying, Economic Geology, Prospecting and everything embraced in a Complsts Mining Engineering education.

Ques. Are all these branches taught by mail?

Ans. Yes. There are now over 700 students studying in this school making good progress.

Ques. What qualifications are required to enroll as a student, and whsn can students commence?

Ans. The only qualification necessary is to know how to rsad and write; students can begin at any time.

Ques. How is instruction given?

Ans. In place oi ths text-books of the regular schools the students receivs carefully prsparsd and liberally illustrated Instruction Papers covering all ths subjects embraced in ths full course. These ars accompanied by Question Papers containing questions upon ths subjects treatsd oi and problems based upon the principles explained. The student studies the first Instruction Papsr and writes the answers to the questions and problems in ths accompanying Question Papsr and ssnds his work back to the School. This work is carefully examined by compstsnt Instructors and if errors have bsen made the necessary hslp is given and it is returned to bs done over. The student is furnishsd with blanks with which to write for an explanation of anything in the Instruction Papers he may not understand. The studsnt is kept studying each Instruction Paper until he has a thorough knowlsdgs of ths subject treated of whsn hs recsives a passing mark on ths records oi the School and is advanced to the nsxt Instruction Paper.

Ques. Is it possible to teach Mechanical Drawing and Mapping by mail?

Ans. Yes. The information givsn is full and clear, the exsrcises ars instructive and practical, and the drawings furnishsd to be copied are worked out in detail. Persons who will apply themssives will learn to draw and plot.

Ques. How is Surveying taught by mail?

Ans. The subject oi Mine Surveying is sxhaustively treated of in three Instruction Papers; in the second of thess clear and full instruction is given as to the use of the Surveying Compass. We ssll a first-class instrument complete with tripod for $19.00. This can be bought by one student or by a club of students and used for practice or to do the regular work about the mines. Or we loan Surveying Compasses to students for practice while studying Surveying, for a small rental.

Ques. What advantages has this method of study over that of the regular School?

Ans. An education is procured without leaving home or losing time from work. The student can take his own time for study. He has his teacher always at hand. He can advance according to his ability and time, without reierence to the other students. Should sickness prevent him from studying he does not lose standing. The cost of the Scholarship is less than tuition in other Schools. The best way to remember a thing is to write it down.

Ques. What are the Scholarships?

Ans. The branches taught in the School are divided into four so-called Scholarships. Holders of Complete Mining Scholarships are entitled to instruction in Arithmetic, Search for Coal and other Minerals, Ventilation, Modes of Working, Mine Surveying and Mapping, Mine Mechanics, First Aid to the Injured, Mine Legislation and Mine Accounts. The Mine Mechanical Scholarship embraces Arithmetic, Mine Mechanics and Mechanical Drawing. The Metal Prospector's Scholarship includes Blow-Piping, Mineralogy, Assaying, Economic Geology and Prospecting. Holders of the Full Scholarship are entitled to instruction in all the foregoing branches.

Ques. What are the prices of Scholarships?

Ans. The Complete Mining Scholarship costs $35 in advance, or $40 in installments. The Mine Mechanical Scholarship costs $25 in advance, or $30 in installments. The Metal Prospector's Scholarship costs $20 in advance. The Full Scholarship costs $50 in advance, or $55 in installments.

Ques. How are the installments paid?

Ans. Ten dollars with the application for admission and the balance in monthly installments of $5 each.

Ques. If a student is unable to pay his installments promptly does he lose his Scholarship and the money he has paid?

Ans. No. If on account oi sickness or any reasonable cause a student is unable to pay promptly, the time of payment is extended.

Ques. What are the other expsnses connected with the Course?

Ans. Only those of postage and stationery and that of the instruments and material to do the Mapping and Mechanical Drawing. By arrangement with The Technicsl Supply Co. of Scranton, we are able to furnish students with these at very reasonable prices.

Ques. Are students required to purchass text-books?

Ans. No. The Instruction Papers form a complete text-book and are all that are necessary.

Ques. Are Diplomas given to students completing the course?

Ans. The graduate receives a Diploma stating that he has completed the course of study embraced in his Scholarship, and that he has successfully passed an examination in all the branches.

Ques. For whom is this School intended?

Ans. Miners, mine foremen, fire bosses, engine drivers, pumpmen and surveyors, and all connected with the mining industry who are anxious to advance. It is an opportunity for them to obtain the technical education necessary to secure better positions and better pay. It is the only way to get an education without leaving home or quitting work.

Ques. Does it require a long time to complete the course of study?

Ans. No. The Instruction Papers are carefully and concisely written by competent mining and mechanical engineers. Everything unimportant is omitted, and only that retained to make clear to the student what he must know. The course is as short as is consistent with thoroughness.

The Complete Mining Course requires for those who can only devote a few hours after work to study about 18 months; the Mine Mechanical Course 12 months; the Metal Prospector's Course 2 months; and the Full Course 2 years.

Ques. How can I obtain more information about the School?

Ans. By writing to The Correspondence School of Mines, Scranton, Pa.; they will gladly send you a free Circular of Information which contains all particulars of the Course of Study, Method of Instruction, Terms, etc.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 21, 1893.

The silver market has been very steady during the week, closing quite as strong as several days since. The feature in metals has been the advance in tin. Lead holds its own at the recent advance.

Copper and Silver Crisis.

The position of the copper market is agreed oo all hands to be ahnormal, says London *Money and Trade*. While the visible supply is small—smaller than in any August since 1884—and the production has been generally reduced, prices have touched a lower level than in 1889, and do not materially exceed the ruinous range of values recorded in the years 1886 and '87, when so many copper mines had to shut down. At the present moment, indeed, a good deal of American copper is being sold here below its productioo cost, the reason being that the crisis brought about by the silver question in the States has necessitated whatever was markeiable being turned ioto money. It is not likely, however, that the present situation will continue long. So soon as affairs are straightened out in America there is certain to be a sharp advance in the price of the metal, which is oow selling at a ridiculously low figure.

Coinage.

The coinage of the San Francisco mint In August was as follows:

Descriptions.	Amount.
Double Eagles	$2.500,000
Half Dollars	100,000
Quarter Dollars	20,000
Total	$2,620,000
January	3,100,000
February	2,640,000
March	1,650,000
April	1,310,000
May	1,740,000
June	1,748,433
July	None.
Seven months	$14,808,433
Same time in 1892	15,573,203
Decrease to 1893	$764,770

The total for the same time in 1891 was $21,809,-011.

Silver and the Metals.

NEW YORK, Sept. 21.—Following are the closing prices for the week:

	Silver in London.	N. Y.	Copper.	Lead.	Tin.
Thursday	34⅛	73¼	9 62½	3 85	20 20
Friday	34⅛	73¼	9 62½	3 90	20 35

The Stock Market.

SAN FRANCISCO, Sept. 21, 1893.

The refusal of the Comstock miners to make any concessions in the matter of wages depressed the stock market for a great part of the week; hut the action of the Gold Hill miners in accepting the reduction (from $4 to $3.50 per day) bad a more favorable effect. Yesterday, in the Comstock market, husiness was more active at the 9:30 session and prices were higher. Yellow Jacket rose to 45 cents, Belcher to 30 cents, and there was a good demand for Crown Point at 20 cents. At the north end Ophir rose to 80 cents bid and Mexican sold at 65 cents—the highest price for the latter stock in a long time. Consolidated California rose to $1.40@1.45. Other stocks were higher in proportion. At the second session husiness was quieter, hut prices were steady.

It now looks as if the eventual outcome of the wage controversy will be acceptance by the miners of the owners' proposal, or, rather, an agreement to work for $3.50 per day. There is no chance of resumption of active operations otherwise, unless the silver market should take a decided turn for the hetter.

The Consolidated California and Virginia Miniog Company has been notified of a shipment of three bars of bullion, valued at $13,354.41, to the Carson Mint—the first shipment on September account.

During the month of August the Eureka and Palisade Railroad Company received in transit to Salt Lake and Vallejo Junction, Cal., 672 tons of ore, as follows: From Eureka District, 466 tons; White Pine, 296 tons, and Nye couoty, 2 tons. Following were the lots shipped from the Eureka District: From the Hamhurg mine, 228 tons; Eureka Con., 134 tons; Richmond, 42 tons; Delaware, 31 tons and Idaho, 11 tons. From White Pine District—Zoanni Bros., 66 tons; Frank Paul, 36 tons; Mfnoietti, 10 tons; McEllin, 48 tons, and C. A. Mathewson, 46 tons. From July 22d up to September 2d no ore was shipped. The ore shipped last month was fortunately of a generally higher grade than has been mined of late years, much of it being richer in gold and lead.

The Navajo Mining Company of Tuscarora has levied an assessment of 10 cents per share.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 5, 1893.

504,515—INVALID'S BED—Boden, Peers & Saxon, S. F.
504,563—WIND DEFLECTOR—B. V. Crumrina, Corning, Cal.
504,445—CRATE—Dare & Hall, El Cajon, Cal.
504,522—HOISTING APPARATUS—D. Donahue, S. F.
504,339—ENAMEL—Z. T. Fowlar, Santa Rosa, Cal.
504,574—FEED WATER REGULATOR—W. Gladstone, S. F.
504,576—FIRE ESCAPE—J. L. Gregory, Washoe, Nev.
504,850—HAT—Chas. Harkins, Menlo Park, Cal.
504,578—FLASH LIGHT—J. N. & H. J. Harrison, S. F.
504,693—BUCKLE—J. G. Hoyt, Haywards, Cal.
504,586—BENCH VISE—T. B. Jackson, Salem, Or.
504,590—LIQUID COOLER—W. F. Kausen, Ferndale, Cal.
504,697—CAR COUPLING—George Ker, Portland, Or.
504,863—LUNCH BASKET—L. Mangulne, Cottage Grove, Or.
504,600—GRAPPLE—Manning & Wilson, Marshfield, Or.
504,601—BEET HARVESTER—H. B. Martin, Chino, Cal.
504,359—BEAN THRASHER—T. A. Miller, Stockton, Cal.
504,860—RECEIPT BOOK—J. D. D. Mortimer, Stockton, Cal.
504,632—STAMPING MACHINE—D. F. Oliver, Oakland, Cal.
504,615—RAILWAY CAR—T. E Pope, S. F.
504,616—RAILWAY CAR—T. E. Pope, S. F.
504,624—HOSE CARRIAGE—W. T. Y. Schenck, S. F.
504,629—ELEVATOR SAFETY DEVICE—Schurtz & Swan, S. F.
504,506—MOSAIC ART GLASS—A. Verhagen, S. F.
522,760—DESIGN FOR LADIES' HAT—J. D. Stange, S. F.

FOR THE WEEK ENDING AUG. 29, 1893.

504,191—TRANSPORTING LOGS—W. V. Allen, Chico, Cal.
503,942—GAME—L. H. Buchanan, Pasadena, Cal.
504,205—ENGINE GOVERNOR—G. E. Dow, S. F.
504,211—SHIP'S PAINT—H. Gallinowsky, S. F.
504,605—TYPE-WRITER KEY CUSHION—Graham & Savell, S. F.
504,218—SPLINT—R. Hoppe, S. F.
4,223—TIMEPIECE ESCAPEMENT—J. H. Langhorst, Jackson, Cal.
504,327—AIR BRAKE—W. H. Masterman, Oakland, Cal.
4,231—GANG-EDGER—McIntire & Koefoed, S. F.
504,278—GAGE—C. W. Preston, S F.
504,244—NUT-CRACKER—W. G. Read, Colma, Cal.
504,052—LEAF-TURNER—J. H. & S. H. Redfield, Grant's Pass, Or.
504,254—RAISIN-TRAY TURNER—M. B. Skaggs, Brentwood, Cal.
504,182—BOOKCASE—J. Stimson, Watsonville, Cal.
504,184—OVEN—W. H. Wiester, S. F.
504,260—GAS ENGINE—W. H. Worth, Petaluma, Cal.
22,761—DESIGN—F. Bishop, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SPRINKLER.—F. E. Caton and F. B. Waring, San Jose. No. 504,965. Dated Sept. 12, 1893. This invention consists of a shallow head into which water nnder pressnre is received. Upon the end of this head is bolted a cover, so that there is a narrow discharge slit around a considerable portion of its periphery. The size of this slit is regnlated by a screw bolt, the cover being elastic and movable by tnrning the bolt so as to regulate the size of the discharge slit.

FLASH-LIGHT BURNER.—Sylvester M. Williams, S. F., Cal., assignor of one-half to J. A. Shepard, same place. No. 504,956. Dated Sept. 12, 1893.

COMBINED CHAROEE, REFLECTOR AND SMOKE ARRESTER FOR FLASH-LIGHT BURNER.—Sylvester M. Williams, S. F., Cal. Dated Sept. 12, 1893.

FLASH-LIGHT BURNER.—Sylvester M. Williams, S. F., Cal. No. 505,014. Dated Sept. 12, 1893.

These three patents cover devices relating to the ignition of combustible powder for making artificial light for photographic exposnres. The first device consists of a folding portable frame, composed of a tnbular central standard and tubnlar side arms connected and commnnicating therewith. These arms are adapted to be extended at right angles with the standard when in nse, and to be folded beside it when not in use. Along the arms are rock shafts carrying cnps which are charged with powder and which, by the rocking of the shafts, throw their contents into gas jets issuing from the hollow arms, thereby making the flash.

The second device consists of a portable reflector carrying a series of charge hoppers with regnlating valves for snpplying the cnps with the powder.

The third device consists of an obstrnction in the month of the cnps, adapted to break np the powder charge in its flight to the jet, whereby ignition is insnred.

MOSAIC ART GLASS.—Adolph Virhaghen, S. F. Dated Sept. 5, 1893. This invention consists of an art glass consisting of a nnmber of independent pieces of glass adherent to the snrface of a bed glass, and a filling in the interstices of a compositon of nowdered glass and a cohesive material adherent to the bed glass.

HOSE CARRIAGE—Wm. T. Y. Schenck, S. F. Sept. 5, 1893. This invention has for its object snch a construction of a hose carriage as to provide for the essy laying np of the hose in a basket or receptacle, with an ontwardly flaring or inclined back portion, whereby the entire space is ntilized and any abrupt bending and injnry of the hose is prevented.

INVALID BED.—Annie Boden, Joseph Peers and Samnel Saxon, S. F. No. 504,515. Dated Sept. 5, 1893. This invention relates to improvements in invalid beds, and it consists of certain novel arrangements of mechanism by which the whole of the supplemental upper mattrass or snpport may be allowed to lie flat npon the lower one, or it may be raised entirely so that changes may be easily made, or the head portion may be tilted np to snpport the patient in a sitting position on the central portion while the foot portion may be partially or wholly dropped to allow one or both feet to drop to the lower mattrass.

HOISTING ANN CONVEYING APPARATUS.—Daniel Donahne, S. F. No. 504,522. Dated Sept. 5, 1893. This invention relates to an apparatns by which goods of any description may be hoisted from the hold of a vessel or other point and transferred laterally to any desired distance by the nse of a single hoisting rope with snitable gnide pnlleys and other connecting ropes, which allow the different movements to be made, and change of direction affected antomatically.

LOCOMOTIVE HEADLIGHT COVER.—Fred A. Stevens, Sacramento. No. 504,949. Dated Sept. 12, 1893. The object of this invention is to provide an easily-operated device by which the engineer can cover or nncover the headlight while standing npon a siding, or whenever desired. It consists of a hinged swinging cover and a pinion npon the hinge shaft, and a rack bar operated directly from the cab so as to open or close the cover.

SASH-HOLDER.—John H. Griswold, Oakland, Cal. No. 504,978. Dated September 12, 1893. This device consists of a plate secnred to the meeting rail of the lower sash, and having an nptnrned arm, hackwardly inclined, forming a space between itself and the opposing stile of the npper sash, which space is widest at the top and narrowest below. In this space is dropped a roller, the ends of which have small axles which are engaged by an inwardly projecting lever bifurcated over the nptnrned arm. By pressing down the lever the roller is raised into the wider portion of the space and the sashes are free to move. Bnt when the lever is at rest the roller will by any any attempt to move the sash be cramped down into the narrower portion of the space and will prevent movement.

PRACTICAL TREATISE ON HYDRAULIC MINING.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, snch as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dumps; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN THE MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Cal. Debris Commission Notices.

NOTICE.—The California Debris Commissioo, duly appointed under the act of Congress of March 1, 1893, having received a petition from E. Below and others for permission to mine by the hydraulic process in the Polaris, Etna and Austral mines, situated in Goodwin Township, in Plumas county, California, and to deposit tailings behind a dam to be built in Hopkins' creek, gives notice to all concerned that a hearing will be held at the office of the Commissioo, Room 92 Flood Building, San Francisco, on October 10, 1893, at 1:30 P. M., On and before this hour and date, all parties interested may nle affidavits, plans and maps in support of their respective claims. By order of the Commissioo. W. H. Heuer, Major, Corps of Engineers, Secretary.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from A. Steinberger for permission to mine by the hydraulic process in the Brandy City District, situate at Brandy City, Sierra County, California, and to deposit tailings in an old hydraulic pit, gives notice to all concerned that a hearing will be held at the office of the Commission, room 92, Flood Building, San Francisco, on October 10, 1893, at 1:30 o'clock P. M. On and before this hour and date, all parties interested may file affidavits, plans and maps in support of their respective claims.—By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Shasta Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (30 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.

JOSHUA HENDY MACHINE WORKS,

(INCORPORATED SEPTEMBER 29, 1882.)

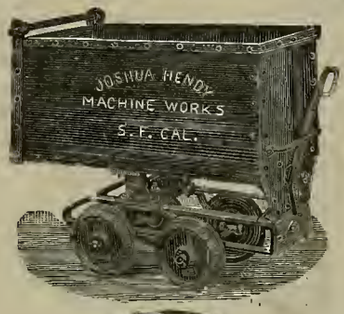
NO. 51 FREMONT STREET, - - - - - - - - - SAN FRANCISCO, CALIFORNIA.

Manufacturers of and Dealers in

BOILERS, ENGINES, PUMPS AND MACHINERY OF EVERY VARIETY.

AGENTS FOR THE SALE OF

"ECLIPSE CORLISS" ENGINES.
"RUSSELL" AUTOMATIC ENGINES.
"CLIMAX" BAND-SAW MILLS.
"EXCELSIOR" BOILERS AND ENGINES.
"ERIE ENGINE WORKS'" BOILERS AND ENGINES.
GARLOCK'S ELASTIC SPIRAL PACKING.
"REEVE'S" WOOD SPLIT PULLEYS.
ROTARY AND CENTRIFUGAL PUMPS.
BUFFALO DUPLEX STEAM PUMPS.
"SENSIBLE" HORSE-POWER WHIMS.
STEAM HOISTING WHIMS.
MACHINISTS' TOOLS OF ALL STYLES FOR ALL WORK.



WORKS:
Corners Kearny, Bay and Francisco Sts.

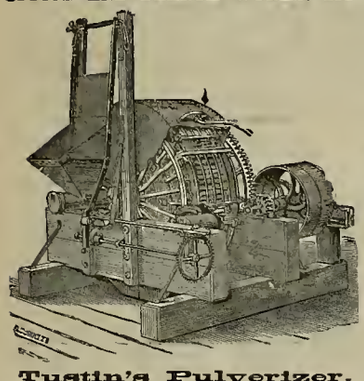
HYDRAULIC MINING MACHINERY.
QUARTZ MILLING MACHINERY.
SAW MILLING MACHINERY.
HYDRAULIC GRAVEL ELEVATORS.
HYDRAULIC GIANTS AND GATES.
"TRIUMPH" ORE CONCENTRATORS.
AUTOMATIC ORE FEEDERS.
MINE AND MILL SUPPLIES.
LEATHER AND RUBBER BELTING.
LUBRICATING COMPOUNDS.
WATER PIPE, ETC., ETC.

FULTON ENGINEERING AND SHIP-BUILDING WORKS.

Successors to FULTON IRON WORKS (Hinckley Spiers & Hayes), and F. A. HUNTINGTON,

ENGINEERS, MACHINISTS AND IRON FOUNDERS.

OFFICE AND BRANCH WORKS: 213 FIRST STREET.....MAIN WORKS: HARBOR VIEW, SAN FRANCISCO, CAL



Tustin's Pulverizer.
Works Ore Wet or Dry.

MINING AND MILLING MACHINERY

ADAPTED TO EVERY DESCRIPTION OF MINING AND MILLING.

MANUFACTURERS OF THE TUSTIN PULVERIZER, Adapted to Wet or Dry Crushing.

ALSO, THE WELL-KNOWN "HUNTINGTON" CENTRIFUGAL ROLLER QUARTZ MILL.

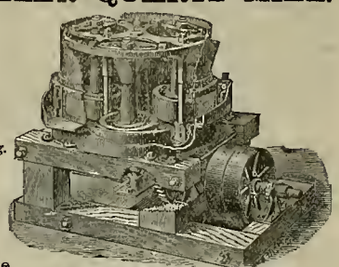
Special Descriptive Circulars of these Mills sent on application.

Specialties manufactured by us:
"HUNTINGTON" BLAKE ROCK BREAKER. FRUE VANNERS.
"FULTON" BLAKE ROCK BREAKER. "BOSS" CONTINUOUS SYSTEM.

Manufacturers of all kinds of
SAW-MILL MACHINERY, including the "HUNTINGTON" SHINGLE MACHINE.
WATER WORKS, IRRIGATION PUMPS.
ELECTRIC LIGHT AND ELECTRIC R. R. AND CABLE R. R. PLANTS.
STEAM ENGINES—Plain Slide Valve, Corliss High Pressure, Corliss Compound Condensing and Non-Condensing.
BOILERS OF ALL KINDS.

STEAMER MACHINERY AND STEAM VESSELS
Adapted to Ocean Going, Deep River, or Shallow River Service.

AGENTS AND MANUFACTURERS OF THE.....
De La Vergne Refrigerating Machines, Filters of the New York Filter Company.
SOLE AGENTS FOR.....
The Deane Steam Pump, Armington & Sims Engines, Leffel Water Wheel of the W. C. Leffel Engine Co.



Centrifugal Roller Quartz Mill.

THE McGLEW ORE CONCENTRATOR COMPANY.

{PATENTED May 5th, 1893.} **CHEAPEST, SIMPLEST, MOST [illegible]RABLE AND CLOSEST SAVING CONCENTRATOR IN USE.** {FRANK BARRERE, Secretary.}

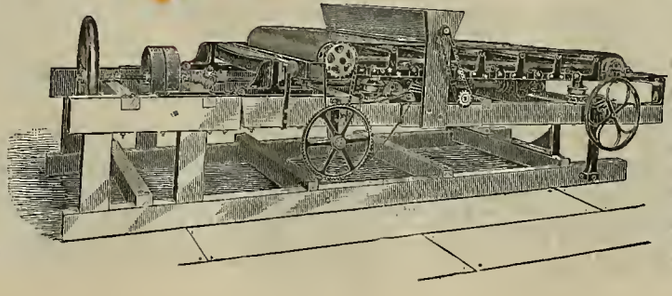
CAN BE SEEN IN OPERATION AT THE COMPANY'S W[illegible].....132 MAIN STREET, SAN FRANCISCO, CAL.

Cal State Library JUL 1894

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, Ioo, SHASTA CO., CAL., May 25th, 1893.

MR. THOS. McGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Mechanics and Popular Science.

VOLUME LXVII. Number 14. SAN FRANCISCO, SATURDAY, SEPTEMBER 30, 1893. Three Dollars per Annum. Single Copies, 10 Cents.

An Interesting Exhibit at the Fair.

In the Transportation Building of the exposition at Chicago there is an exhibit from San Francisco that attracts a great deal of attention. It is the original car and dummy used on the old Clay Street Hill railroad in 1873, with the tube containing the identical yokes, channel iron and rails used on that road, which was the first cable railway ever used, as far as known, in this part of the world. There is also a loan exhibit of grips, contributed hy various cable railway companies of the United States, and a number of other details in connection with the cable railway syatem, all being entered and exbihited by Mr. A. S. Hallidie of this city. It is the only exhibit of the kind at the exposition, and is the subject of much inqniry and interested comment by numbers of visitors.

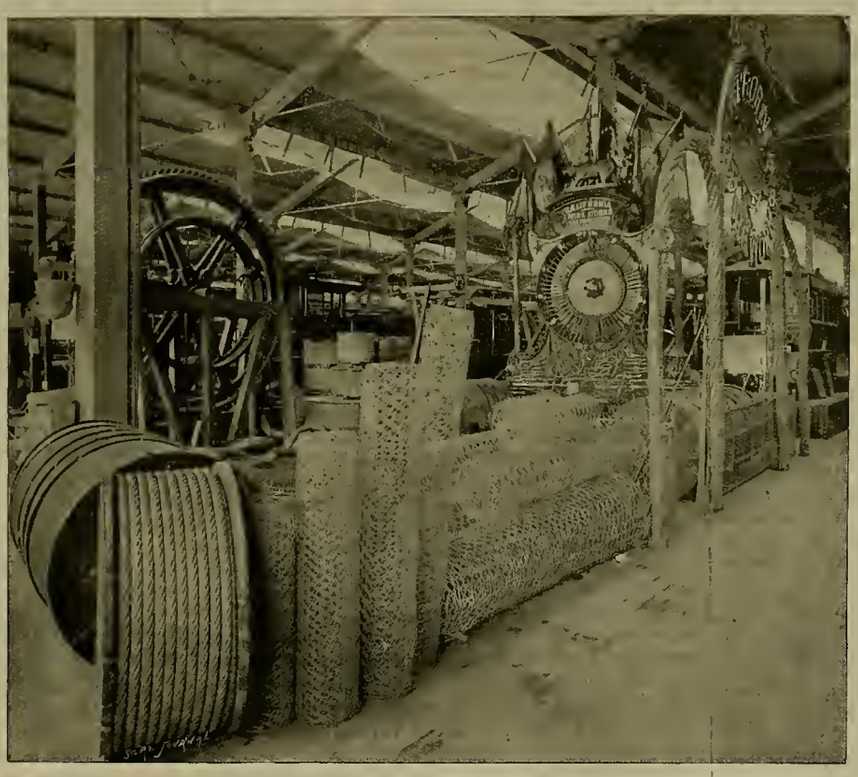
In the same space the California Wire Works have a very extensive and valuable exhibit of their manufactures. There are twenty coils of wire rope used for all kinds of purposes and especially for cable railways, a sample board twenty feet high hy sixteen feet wide having samples of all sizss and kinds of wire ropes and cables, flat and round, and seventy different kinds of knots and splices made by the workmen of the wire rope shop of the company. There are also samples of their other manufactnres, including wire nails, harb wire and wire of all kinds. The exhibit occupies a space of seventy feet hy twenty-two. The wire exhihit altogether represents very creditably the product of a manufactory that in its specialty —the manufacture of wire ropes for cable railways—leads the world.

A fair idea of the capacity of the works in this line may be ohtained from the letter of Supt. Wallis nnder "Foundry Notes" in this issue.

The company have been improving and perfecting their processes of manufacture for a number of years and recently erected a new steel plant for tempering steel wire for railway cables. All wire used hy tbe company undergoes tests as follows: The tensile strength and elongation are first ascertained by a nicely adjusted machine; then another machine determines the torsion, after which the wraps are ascertained by means of another apparatus. Before the wire is ntilized for a street railway cable it must sustain a tensile strain of 200,000 ponnds per square inch. The slongation must not he less than 2 per cent, and the torsion must he 45 twists in a lengtb of wire eqnal to 100 diameters. The wraps consist in bending the wirea complete turn on another wire of the same diameter, straightening it and bending it again with a complete turn in exactly the same place and straightening it out. All the tests must be made without fracture in the wire.

Another specialty of the company is the Hallidie ropeway. The same careful and thorough methods used in the manufacture of street cables are applied to the ropeways. Their high merit is amply attested by the fact that large numbers are in use.

The Hallidie and wire works exhibit at the fair have been suhjects of illustration by a number of Eastern journals. Among others, tbe *Street Railway Journal* (from which the accompanying cut is reproduced), the *Street Railway Gazette* and the *Engineering and Mining Journal* have given the exhihits commendatory notice.



CALIFORNIA WIRE WORKS AT THE CHICAGO FAIR.

The outlook in the Cœur d'Alene mining region is much hrighter than for some months. The improved aspect of things has been hrought about by two things, viz.: the rise in the value of lead, and the settlement of the labor troubles. Operations have been resumed at the Bunker Hill and Sullivan mines at Cœur d'Alene under the terms offered by the company—$3.50 per day for miners and $3 for car men and shovelers. One hundred men were employed Monday, and the force will be increased to 400. The Gem, Helena and Frisco mines at Gem will resume work within a few days, employing 300 men at the same wages. All the other mines in the Cœur d'Alenes are expected to resume under this arrangement, the Knights of Labor and the Miners' Union having sanctioned the action of the men in returning to work. Within a week over 1000 men recently idle will be at work.

The I. X. L. Mining and Milling Co. at Boulder, Colo., is making preparations for huilding a house of sufficient capacity to erect a 40-ton MacArthur-Forrest process, and 10 tons capacity will be put in at once. It is claimed that test rnns have heen made in Denver by the owners of the MacArthur-Forrest on I. X. L. mineral and 95 per cent of the prscious metal saved.

The Debris Commission has just made a trip to Brandy City, Sierra county, to inquire into the condition of the mine proposed to he worked by A. Steinberger. Two more applications are pending, and the prospect now is that a number more will soon be placed on file.

Cheap Milling Essential.

A local stock operator struck the key-note to the situation on the Comstock when he declared the other day: "Under the old plan the cry was, 'Can we strike a body of high-grade ore?' Now the proposition is, 'Can we get these low-grade ores out with a little margin of profit?'" That is it exactly. There has been little effort in the past to reduce the cost of milling ores to a minimum, and the general policy of the operators has apparently heen to stiffen the backbones of weakening stockholders with gilt-edged promises for the future rather than to demonstrate what could he done with tbe ore in sight. The new plan promises better things. And while the low-grade ore is being worked the hunt for higb-grade can go on just tbe same.

It is interesting in this connection to note that the Virginia *Chronicle* of recent date contained the following: "There are some points on the Comstock where ore of more than the average value is being extracted, and which are considered good prospects. The winze 20 odd feet down from the 1300 level of the Hale & Norcross persists in showing good ore, altbough it is some time since the ore was opened up, and somewhere between 40 and 50 carloads of ore, averaging according to car samples $35 per ton, have been mined. The hottom of this winze is an interesting spot that may speak for itself in the immediate future. Work to the eastward was started there recently for the purpose of putting in square sets, and important developments may follow at any time.

"Forty-dollar ore is being extracted from tbe west ledge ahove the 400 level of the Occidental. The value of tbis ore is all right; all that is needed is enough of it.

"Three hundred and forty-eight tons of ore, averaging per battery sample $19.91 per ton, were milled last week at the Nevada mill for the Potosi mine, and 210 tons, averaging per battery sample $22.50, were milled for the Savage. The Savage shipped 7400 pounds of crude hullion to the Mint at Carson. The Con. Virginia had $13,000 on hand at the close of the week. The Kentuck shipped gold bullion to the Mint to the value of $3239. This constitutes the production of the Comstock for tbe past week, and, if nothing else, shows that there is still ore in the mines and that there are still possibilities for the discovery of a large hody."

The Grass Valley *Union* on September 24th published a complete and accurate review of the Grass Valley mining industry. It was ascertained, among other things, that the dividend-paying mines—the Idaho-Maryland, the Empire, North Star, Omaha and W. Y. O. D.—are in hetter shape than at any time for five years, and others bid fair to contribute much to the wealth and fame of the district.

The President has nominated R. E. Preston as Director of the Mint, vice E. O. Lsech, resigned. Mr. Preston has been acting director.

TABLE OF CONTENTS.

ILLUSTRATIONS.—California Wire Works at the Chicago Fair, 209.
EDITORIALS.—An Interesting Exhibit at the Fair; Cheap Milling Essential; Miscellaneous, 209. The October Convention; To Cheapen Silver Values; The Comstock Situation, 210. The Chilean Mining Exhibition; The Grass Valley Mines; A New Fine-Gold Process; Miscellaneous, 211. Mining and Civilization, 212.
MISCELLANEOUS.—Tailings, 211. Foundry Notes, 212. Studies in Gold-Milling; Specific Gravity of Gold in Gold-Silver Alloys, 213. Limitations of the Gold Stamp Mill; One More Prehistoric Toad, 214.
MECHANICAL PROGRESS.—New Railroad Snow-Clearing Device; Ferris' Great Wheel; A New Rowing Device; Doing Away with the Dead Center; Wear in Wrought-Iron Bridges; Compressed-Air Transmission; One Hundred Miles an Hour; Aluminium for Bullets; Steam for Buggies; Brakes to Help Start Cars, 216.
SCIENTIFIC PROGRESS.—The Telotype; Evidence from Ashes; Aluminium Flashlight; To Duplicate Hand-Writing, 216. The Lantern in Stage Effects; Metric Equivalents; The Yerkes Telescope; To Fireproof Combustibles, 217.
ELECTRICITY.—A Mill Where Belts are not Used; Electricity on Steel Cementation; The Storage Battery; New Electric Block Signal; Electrical Power for Brick Machines; More Light from a Dynamo; New Fire Alarm; New Method of Signaling; Disinfection by Electricity, 218.
USEFUL INFORMATION.—The World's Coal Production; Mining Royalties in England; How to Grind a Cold Chisel; To Estimate Brick Work, 218 Useful Hints; Coal Mines and Health; Experiment with a Cedar Shingle; Cultivate a Memory for Names; Gold and Silver in the Arts; Lemon Syrup; World's Fair Distances; A New Rain-Maker, 219.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 221-222.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 223.

SOME YEARS AGO Judge Sawyer declared hydraulic mining a "great and intolerable nuisance," and there was rejoicing in some parts of the State that the nuisance had been abated. But some way the enthusiasm with which the decision was received has died out, and the predictions of enduring benefit to the industries of the State which followed it have turned out to be a trifle awry. The volume of the virgin products of the State has been restricted for ten years somewhere in the neighborhood of $100,000,000, at the rate of $10,000,000 per year, the common estimate. The anti-debris people have apparently not been able to raise enough additional grain, fruit, wool, hops, hides or vegetables to compensate for the loss. All their interests affected by the debris fight are not half as valuable as one year's output of these idle mines. In the midst of hard times the State is able to realize the situation very keenly. Public opinion now cordially indorses any reasonable effort to restore the great and intolerable nuisance to its former position of vigor and value.

THE wage question on the Comstock seems somewhat nearer settlement. The Gold Hill Miners' Union, which recently decided to reduce by a narrow majority, on Wednesday re-voted, with the result that 107 declared for $3.50 per day and 37 for $4. The Mechanics' Union, by a vote of 74 to 19, has likewise agreed to accept a reduction of fifty cents. It cannot be doubted that the action of these organizations will seriously shake the determination of Comstock miners to resist reduction, and the question will probably be opened up again. Under all the circumstances, concession on the part of the miners seems to be inevitable. Guarantees have been given that fuel and water shall be cheaper and the cost of living reduced. More men will doubtless be employed, so that the condition of the miner will really be improved. It is to be hoped that an early adjudication of the difficulty will be reached.

IT is said to have been discovered that slag or waste that accumulates so rapidly about iron furnaces has valuable fertilizing qualities. Not long ago it was found that the waste material was especially rich in phosphates, and, if properly handled, would be a valuable plant food on almost any soil. This was found to be especially true of the slag formed from the ores used in making iron and steel by the basic process, in which lime is extensively employed. The ore contains a large percentage of phosphoric acid, which, after the action of the lime, forms a phosphate of great strength, and, when ground to a powder, is a splendid fertilizer without further treatment. The slag resulting from other processes is not so valuable, but most of the powder made so far is said to have produced excellent results.

The October Convention.

It is designed to make the forthcoming miners' convention, (October 9th) a representative gathering from all the mining districts of California; and to that end the various county organizations are especially solicited to name as delegates such persons as not only have the interests of their several counties at heart, but who will attend. It is true that the convention does not meet under the same serious conditions as on the two previous occasions; nevertheless there are a number of very important matters requiring their attention and their definite action. The larger the convention, and the more direct its deliberations and harmonious its conclusions, the more likely is it that an impression will be made upon Congress, which it is designed to influence in several matters of legislation. As the result, or partly as the result, of the former conventions, which were large and enthusiastic, we have the Caminetti law. The coming assembly can accomplish as much in this and in other directions. Large attendance is essential. A good plan in the past has been for county associations to name as part of their delegations mining men resident in San Francisco or vicinity who own and operate mines in their various localities. It might be desirable in some instances to try the same plan for the coming convention.

The matter of absorbing interest at past conventions has been the resumption of hydraulic mining. The chief object of the miners has secured embodiment in the Caminetti law, which is now in operation. There was a feeling among quartz miners, which manifested itself to a greater or less degree, that their interests had been overlooked. It is true that they were subordinated; but they need not and doubtless will not be in future. The October convention will address itself to consideration of several matters concerning quartz and drift mines as well as to various things pertaining to hydraulic mining. The Stewart mining bill must be considered. Notwithstanding the fact that Senator Stewart has been petitioned to change several features very objectionable to the miners of California, no modification has been made, or is proposed, so far as we know. It has been clearly pointed out to the Senator how seriously the bill threatens the interests of drift miners in limiting the area of patentable claims to an absurd minimum. It will prevent the running of bedrock tunnels to tap the bottom of ancient river beds under volcanic caps. Under rulings of the department no patent can be obtained to ground previous to the discovery of gold. Drift-mining ground must be worked out. Drift miners can scarcely be expected to work under these onerous conditions. They must expend thousands of dollars, and in many instances, traverse thousands of feet of ground by tunnel before pay gravel is reached. They do not want to spend money, time and energy on ground to which they have no patent. All this is familiar to California miners, but Senator Stewart has seemingly been so busy impeaching the President and laying parliamentary traps for his gold-bug adversaries that he has paid no attention.

The legislative committee of the State Miners' Association has under consideration now several propositions which it is getting in shape to present to the convention. All who have resolutions or other measures they wish to have considered should either send them to the legislative committee, or present them in writing for presentation to the convention.

To Cheapen Silver Values.

Representative Loud of this State has succeeded in getting through the House a resolution calling upon the Secretary of the Treasury for information as to his reasons for not carrying out the silver purchase law. The matter is certainly a proper subject for inquiry. During the past several months the silver purchases have averaged about 1,000,000 ounces less per month than the 4,500,000 required to be purchased by the Sherman law.

The reason given by the Secretary and the mint authorities for failure to comply with the law has been that the price of silver is fixed in London and that various offers of silver to the mint have been out of conformity to its value thus fixed. But this is believed by friends of silver to be only a pretext, and that recent practices have been simply a part of the policy of the administration to ignore silver and depress silver values. An instance of the methods of the authorities is cited by a local paper: "A large dealer in the precious metals offered several thousand ounces of silver to the mint for $0.7625. The London quotation that morning, or its equivalent, was $0.7635. The silver was offered at the mint for ten mills less than this equivalent, and yet the authorities refused to accept it at this figure. They made an alternative offer of $0.75. This, of course, was refused, and the silver was sold in open market for $0.76. A statement of these facts was forwarded to Senator Perkins at Washington. He immediately sent the letter to Acting Director of the Mint Preston. The reply of that official contained a resume of the transaction and admitted the truth of all the statements pertaining to it. Director Preston concludes his letter by the statement that the department reserves to itself perfect freedom of action in the purchase of silver and the right to fix its price as it sees fit."

If the latter statement credited to the director is correct, it discloses an astonishing conception of his duty under the law. It is not the office of the mint to bear silver and "fix the price as it sees fit." It is to ascertain the normal market value and pay it. The public have a right to expect that the mint will do what it reasonably and legally can to sustain the value of one of its money metals.

The Comstock Situation.

A striking instance of the attitude of the investing public toward Comstock shares is found in the delinquent Exchequer sale which has just taken place. Sixty-six thousand shares out of a total of 100,0 00 were forfeited for non-payment of the last assessment of 10 cents per share. The stockholders had faithfully paid thirty-five assessments, but the majority were unable to stand the thirty-sixth, and forfeited. It is interesting to note that on September 21st Exchequer stock sold at 10 cents a share—just the amount of the assessment. The total assessments on the mine have aggregated a round $1,000,000. Exchequer is by no means an isolated instance of a refusal, or inability, of shareholders to stand a further drain. Recently 55,000 out of 108,000 shares of Alta Con. and 26,700 out of 112,000 shares of Hale & Norcross went into the treasuries of the companies.

It seems almost unnecessary to point out the moral or the train of events that has brought about this condition of things.

Of course the recent slump of silver had much to do with injuring confidence in the Comstock and interferred seriously with the plans of the various companies. It was the chief instrument which brought on the crisis in stock affairs. But the drift had long been in the direction of a revision of methods and withdrawal of the element of speculation from the conduct of the mines and the organization of the companies. It needed only some such agent as the break in silver to bring matters to a head.

The future of the Comstock is yet uncertain. It is too much to expect that a revision of present methods of stock manipulation, an honest effort to place the mines on a dividend-paying basis, and a reduction in the cost of mining and milling, will revivify the old lode and restore the "boom." But, under ordinary market conditions, it seems that there ought to be a profit in at least some of the mines. The ores generally contain a large percentage of gold. Many believe that the old lode is worked out. But it would probably be somewhat more correct to say that the old stock methods are worked out. It must be perfectly evident to the various companies that a change in their organization is necessary. They have given an indication of their appreciation of the state of things by reducing officers' salaries and office expenses. They are endeavoring to lower the cost of operation at the mines. It is said that measures are being devised for the cheapening of the cost of production in other ways. That these efforts may have a successful conclusion is the desire not only of the share-holding public but of all who know and care anything about the Comstock and its brilliant past.

A TUOLUMNE PAPER recently called attention to the disposition of miners in that vicinity to withhold information about the progress of their work or the real character of their strikes. The result is a letter from Julia Winchester, superintendent of Truths mine, Columbia, who acknowledges the justice of the criticism and writes a model letter containing full information about the development of her property. Says Miss (or Mrs.) Winchester, in addition: "All mining done conduces to the general good of the county. I believe in legitimate mining being carried on. I believe in the vast richness of gold and silver to be unearthed by right methods. And I shall be glad to do my part to point a true way to capitalists who are now holding back millions from investments because of distrust." This smacks of glittering generalities, but it shows the right spirit. The industry needs more Julias and more Truths.

THE Nevada *Herald* declares that there is a grand channel in the Washington ridge, and urges that drift mining be undertaken to develop it. It is said that there is room for a half-dozen good companies between the Harmony and the Central House. What the owners of claims in the unprospected belt ought to do is to combine and purchase a drilling outfit and bore holes enough to locate the channel, then development work could be made without so much uncertainty and at much less expense.

The Chilean Mining Exhibition.

Writing from Valparaiso to the *Chronicle* relative to the proposed international exhibition of mining machinery at Santiago Henry D. Woolfe says: The Chilean Congress has voted money for carrying out the project of having an exhibition of mining machinery, and the Government will pay the freight to and from any part of the United States to Santiago, reserving the right, however, to demand from the exhibitor the return of such outlay in the event of his exhibit being sold in Chile or elsewhere in South America.

The necessary buildings, now under construction, are located in a most picturesque portion of the city of Santiago. Power, either steam, electric or compressed air, will be furnished free to all exhibitors, while sufficient rock to illustrate in a practical manner the work of the various machines will be provided. It is proposed to open this display in April, 1894, continuing until June 30th.

In addition to mining machinery, electric appliances, wire rope and other motive apparatus used for mining purposes are admissible, while models of machinery and relief work showing improved methods of coal mining are particularly desired.

The most important section for San Francisco firms is the machinery department. Chilean mines are to-day using the most antiquated apparatus. With improved machinery the mines would surely be of immense value. Mine owners know nothing of American plants, beyond pictures seen in catalogues.

This exhibition will be of value not only to let Chileans see the most improved mining machinery, but that the visitors from Argentina, Peru, Bolivia, Ecuador, Uruguay and even Brazil will be impressed when they see that San Francisco can supply their needs. If the various foundries and machine shops will unite to make a good display their efforts will not be in vain. Any circulars or pamphlets describing the articles exhibited should be printed in Spanish. This is absolutely necessary.

It is to be hoped that San Francisco will be well represented at Santiago, as it is well known that German, English and French exhibitors have already applied for space, as well as several Eastern firms in Chicago and New York. Chileans to-day have the kindliest feelings toward the United States and will accord American exhibits the best possible treatment.

The Grass Valley Mines.

The Grass Valley mines have never attracted more attention at any time in their long and creditable history than at present. Development in the various old properties is going actively forward, and prospects and new mines are all said to give substantial promise of profitable returns. Much money is disbursed in Grass Valley by the operation of these mines, and, as a result, there is no more prosperous district in California. The *Union* makes an estimate of the number of men employed in the mines of the district and the amount of wages paid per day and the aggregate per month. The total is as follows:

Mine.	No. Employed.
Idaho (day's pay)	175
North Star (day's pay)	125
North Star (contract)	20
North Star (tribute)	20
Empire (day's pay)	80
Empire (tributers and contractors)	40
W. Y. O. D. (day's pay)	67
Omaha	70
Slate Ledge	15
Small mines (actual count)	107
Small prospects (actual number not known, about)	30
Total	750

The wages paid to each man employed will average at least $2.50 per day. This is a conservative estimate, for nearly all the miners in the district receive $3 per day, and "top" hands $3.50 to $5. As will be seen, a big margin is left for tributers and contractors. From this statement the following deductions may be drawn:

Seven hundred and fifty men employed at $2.50 per day means that $1875 goes into the homes of miners in the district every day.

Allowing 26 working days a month, the amount would foot up $48,750.

For the year the amount would foot up $585,000.

These are not "boom" figures, but a statement of the actual condition of things. This money is almost wholly spent at Grass Valley. The mines are the basis on which the town is built. As development increases in extent, there are larger and better things in store for Grass Valley.

KNOWLEDGE of the geology of the well-known Cripple Creek gold camp, Colorado, appears to be very obscure. A correspondent of the Denver *Mining Record* says: "Among the many thousands who have visited this camp it is barely possible there is some one who knows or has solved the enigma of how such things as exist here came to be, but of such the number is few. Locally, one says porphyry, trachyte and granite are the rocks, but in a circle or basin some 12 to 15 miles in circumference the country rock is generally termed porphyry and outside of that granite. The best of the mines here have been found in porphyry, which is a very fine-grained rock, feldspar being the base, associated with quartz and not unfrequently with minute crystals of iron pyrites, hence the name given it by Prof. Emmons of pyritiferous porphyry."

A New Fine-Gold Process.

The latest process for the separation of fine gold in placers comes from Montana, and is the invention of E. F. Dawes and Eelif Hanson of Missoula. It is a dry process and is designed especially for fields distant from sufficient water for other methods. It is described in a local paper as follows: "The ore or gravel is run through a crusher and a steam dryer, after which it is dumped into the hopper of the separator. Dropping from this it strikes a powerful blast of air, which carries it between two sets of slowly-revolving copper cylinders, coated with one-sixteenth of an inch of mercury. These cylinders are placed in two lines of three each, one above the other, so that the dust, driven by the air blast, passes between them in a wavelike line. The ore first strikes a cylinder similar to the others, but revolving in an opposite direction, which catches the coarser gold and the nuggets. Then passing between the other cylinders, all the gold is caught, however fine, and the waste is carried by the air-blast to a conveyor, which bears it away. The mercury on the cylinders is constantly renewed so that a fresh surface is always presented."

It is claimed that the process has been given a practical test that has demonstrated its adaptability to this class of work, and its success is assured. Mr. Dawes has been at work upon the scheme for several years and he and Mr. Hanson have just perfected a separator that works satisfactorily. Six men can handle a large amount of gravel with the process.

A PROMINENT CITIZEN of the State of Washington—Col. L. S. Howlett, of North Yakima—has suggested in the public prints that employment might be found for many unemployed men by grubstaking, and he asks the business men of the cities to furnish the means. The Cœur d'Alene mines were discovered by grubstaked miners. Senator Taber, of Colorado, made his fortune in this manner. And numerous instances might be cited where the practice has proved profitable to miner and capitalist. The recent influx of large numbers of Colorado and Nevada miners into this State suggests that the same method might well be employed more extensively here. The miners, as a rule, are deserving men and experienced prospectors. For an outfit they want principally bacon, flour, sugar, etc., and blankets, if they have none. The cost is small. The results may be very great.

A COLORADO paper tells how several properties at Raven Hill are being worked with plows and scrapers: Spread over the surface is a bed of decomposed quartz and porphyry seven or eight feet in depth, which is rich enough to bear transportation to water and yield a profit by sluicing. A foot or so of soil on top of the pay gravel has to be removed and this can best be done with plow and scraper. Running through this highland placer deposit is a quartz ledge from 10 to 12 feet in width on which a shaft, now down about 20 feet, is being sunk. The major part of this ledge is a brown iron-stained quartz with streaks of crystallized quartz running through it, in which many specks of free gold are visible. The decomposed matter found in the seams yields gold in panning. There is also quite a showing of what some persons, claiming to know pronounce green tellurium. It has not been tested.

C. B. DUGAN, of this city, an old miner, has recently returned from a two and one-half years' prospecting tour in Peru and Ecuador, South America. Mr. Dugan spent much time in the Sierra del Pasco region, Peru. He devoted himself largely to the investigation of placers, and found in the channels of streams deposits that he is satisfied will yield from $40 to $50 gold per ton if a satisfactory process of separation can be found. The trouble is that the gold is much laminated and sluices fail to perform their office. The native methods are crude and unsatisfactory, but nevertheless the natives are able to make several dollars a day. Mr. Dugan thinks that he may be able to devise some scheme of amalgamation with copper plates that will be profitable.

THE Butte and Boise railroad has been projected to run from Butte, Mont., to Boise, and the route already surveyed passes through Gibbonsville. That this road will be completed in the near future is probable from the fact that it will open up an extensive gold-mining region yet hardly touched.

Slickens.

IT is claimed that rich gold deposits have been discovered in the Alberni district, British Columbia.

THE Nevada City *Herald*, in a self-congratulatory mood, declares that there are "no free soup kitchens in town."

THE result of crushing of ore from the croppings of the Black Bear mine in Rough and Ready township, Nevada county was $4.50 per ton.

THE old Pinacate placers in San Diego county, and near the San Bernardino border, are being reworked with excellent results. Dry washers are used.

EN BALLOU, of South Fork, Shasta county, is said by local papers to have devised a process that successfully works ore up to 95 per cent of its assay value.

NOW that its lawsuit has been decided in favor of the Justice Mining Company, arrangements are being made to resume work in the gold-bearing ledge at an early day.

THE Humboldt *Times* claims that over $600,000 in gold was taken from the Klamath, Trinity river and Willow creek mines, in Humboldt county, during the past year.

MR. GEORGE P. THURSTON, of San Francisco, has been elected superintendent of the Orleans mine, Grass Valley. Active work in developing the mine will be the order of things.

THE Gold Flat Mining Company has leased the mill of the Nevada County Mine at Nevada City. It is expected that the mill will be kept running most of the time on ore from the Gold Flat.

THE Centennial gravel mine, on the Washington road, Nevada county, has been started. The owners, all Virginia City people, have put up sufficient coin to work it, until, they say, they strike rich gravel.

THERE will be a meeting of the Yuba County Miners' Association at Smartsville on Monday, October 2d, at 8 P. M., to elect officers and choose delegates to attend the annual convention of the California Miners' Association.

THE Colombian Gold Mining Company and the Sacramento County Irrigation Company have incorporated, each with a capital of $1,000,000, fully subscribed. Directors of each—J. A. Merrill, A. R. Dow, D. R. Thomas, R. W. Button, W. B. Thomas.

T. F. WALSH, of Leadville, half-owner of a smelting plant at Kokomo, Colorado, and J. W. Benson of Denver, who contemplate building a smelter in the San Juan, state that by a new process they can treat $5 silver ore at a profit. The method is not given.

THE Calumet and Hecla Mining Company has declared a dividend of $5 per share, or $500,000, payable on September 27th. This is the largest dividend paid by any mine in the world. The Calumet is a copper mine, and the price of that metal has recently been down to 9½c per lb, the lowest in many years.

ON the recent trip of the Federal Debris Commission and State Commissioner Kidder to Brandy City, Sierra county, the team hauling the Commissioners ran away and a serious accident was narrowly averted. As it was, Commissioner Kidder escaped with a broken collar bone. His companions were not seriously hort.

THERE has been a change in the superintendency of the Evening Star mine, Nevada county, George A. Taylor having retired as superintendent, and Mr. Peet of San Jose socceeding him. During Mr. Taylor's management of the mine he has been active and economical, and had gathered around him a competent set of miners.

THE Veta Madre Mining Company has incorporated in San Francisco. Directors—G. M. Foote, F. E. Luty, T. E. Jewell, John Henderson, W. B. Murdoch, S. L. Theller and Sylvester Gardner. The capital stock is $400,000, in shares of $2 each, all fully subscribed; 190,300 shares are held by Sylvester Gardner as trustee of an estate.

SOME miscreant blew up 600 feet of flume belonging to the South Yuba Water Company near Quaker Hill, Nevada county, at three o'clock Tuesday morning. This cots off the water supply of Grass Valley and its big mines. In consequence most of the mines will have to remain idle for about five days, as there will only be water enough to run the pumps.

J. B. Low, W. S. Lyle and P. Kervin have returned from their visit to Vanderhilt district. While there they made a careful examination of the Gold Bar and other claims in the district, in which John W. Mackay, James L. Flood, W. S. Lyle and G. R. Wells are interested. They decline for the present to make public the result of their investigations.

THE promoters who arranged the casting of the Montana silver statue of Liberty in the Mining Building at the Columbian Exposition announce that they will take the statue to the Midwinter Fair to exhibit if space is allotted. This is the statue for which Ada Rehan posed and over which there was such a controversy as to which one of several well-known theatrical stars was really asked to pose as the model.

THE Quincy Mining and Water Company, which recently bought the property of the Plumas Mining and Water Company, in Plumas county, and which intended to inaugurate mining operations on a large scale, has been enjoined by F. C. Terry, an adverse claimant of a part of the property. The *National-Bulletin* says the community is very indignant over Mr. Terry's action, which is without warrant.

DR. ALEX. TRIPPLE has been appointed superintendent of the Phœnix mine at Cave creek, Ariz. This mine with its mill of 100 stamps, will be one of the largest in the West. The doctor was for many years general manager of the Globe mine and was the first superintendent to bring this property into prominence, and to establish its reputation as a big payer of dividends and one of the largest producers of copper in Arizona.

SOUTH AFRICAN papers note the arrival at Cape Town, August 16th, of John Hays Hammond, the well-known California mining engineer, who has gone to the Witwatersrand under engagement to the big Barnato Brothers' syndicate, as expert adviser on the properties with which their house is connected. Mr. Hammond is accompanied by V. M. Clement, mine manager, and S. B. Connor, a leading millwright, both gentlemen

of Mr. Hammond's own selection in the States. Gossip assigns to Mr. Hammond the biggest salary yet paid to any one in South Africa, said by one authority to bs as much as $30,000 for ths term of his sngagement, which will not bs more than seven or eight months. His mission thsre is to organize the properties of the Barnato syndicate, and introdoce in their operation such California mining practice as is adaptsble to the Rand. Mr. Hammond will return here next year.

A special from Bonham, Texas, says: A syndicate, includ-ing prominent men of Texas, Colorado, Missouri aod Ksusas, is being formed to coin dollars into hexagon shape, at the rate of $100,000 dollars per month or more, if the legislatores of these States will declare such coio legal tender. It is claimed that no individual or corporation is prohibited from coining silver into standard dollars provided the shape of such coins is not the same as of the coins issued by the United States Government.

The August cleanup at ths Treadwell mine, Alaska, is as follows: Shipment of bullion, $82,297; tons of ore milled, 20,-691; tons of sulphurets treated, about 400. Of bullion, there came from eolphurets $24.759; estimated gross expenses for psriod heve been $23,541. Note.—The estimated profit of over $58,000 is considerably larger than for any previous month in ths history of the mine. The superintendent attributes the iocreased yield for the month partly to the fact of increased amount of ors having been mined from the 110-foot level, which is the despest portion of the workings.

What, according to one expert, is "the greatest mining invention of the age," hes recently, it is said, been successfully tested in the deep Pennsylvanian anthracite coal mines. It is an apparatus to enable rescuers to enter a colliery immediately after en explosion without fesling ill effects. It consists of "an air-bag, an appliance to hold the nose shut, and a hattery and a small incandescent lamp." The air-bag is of canvas, and is worn on the back and fastened under the arm. Air is inhaled by the mouth from this bag by means of a rubber-tube connection. The hattery is strapped about the person and the lamp is pinned to the coat.

Mines in the noteó silver camp of Creede, Colo., are again being worked, but with reduced force aod reduced wages—$2 and $2.50 against $3 and $3.50 per day formerly. In all instances where the resumption has occurred it has been on agreement between workmen and mine owners that as eoon as the price of silver goes up the wages ars to be restored. In all the mines the ore being stoped is of the lower grade ressrves, this being calculated not only to give more men work in its outputting and handling, but it also keeps the smelter etacks in blast without msking any considerable increase in the supply of silver or rendering mine owners liable to considerable loss, as shipping high-grade ore would.

John D. Beam, an sggrieved stockholder in the Waterloo Mining Company, locsted in Madera county, has brought suit to declare an assessment of 15 cents a share on the capital stock null and void. The defendants are the corporation and J. M. Bailey, Belinda S. Bailey, Jobn Doe and Jane Doe comprisiog the bosrd of directors. Beam charges that the assessment was levied without causs in pursuance of a conspiracy between the defendants, having for its object to defraud him (Beem) of his etock. The directors are alleged to have known that Beam could not psy the assessment. He owned 35,000 shares of stock, which would heve made his total assessment $5270. Beam says that the sole object of the assessment was to "freeze" him out of the company.

We are in receipt of a copy of The Coal and Metal Miners' Pocket Book, published by The Colliery Engineer Company of Scranton, Ps. It is a handsome volume of nearly 600 pages, containing in a brief and simple form information, rules and tables on all subjects connected with either coal or mstal mining. It is boond in flexible morocco with pocket and flap and is printed with new typs on fine light paper. All departments are illustrated with drawings and cots so as to make the text as clear as possible. It is an invaluabls book for mine-owners, eupsrintendents, foremen, mining engineers, mins mechanics, or mining students. It is sold for $2.75 in flexibls morocco, and $2.00 in cloth. It can be secured at thess prices, postage prepaid, from Ths Colliery Eugineer Company, Scranton, Pa.

Foundry Notes.

The Fulton Iron Worke are constructing a ten-stamp gold-mill for Prescott, Arizona. It will bs shipped next week.

Bids have been opened at Washington for ths construction of a boiler-house and laundry building at the Marine Hospital in Sen Francisco. The lowest hidders were C. Green & Co. of Chicago, at $6479.

The battle-ship Oregon will leave the stocks of the Union Iron Works Octobsr 26th. Ths christening will bs performed by Miss Daisy Ainsworth, daughter of Capt. J. C. Ainsworth. She is a native daughter of Oregon.

The Vulcan Iron Works have just furnished two Bruckner furneces to ths Germania Lead Works in Utah, owned largely in Sen Francisco. The furnace cylinders are each 102 inches in diameter, 22 feet long, and capable of receiving 12-ton charges. The cylinders each weigh 23 tons and will add largely to the reduction capacity of ths works.

The following self-explanatory communication has been received from Mr. George H. Wallis, superintendent of the California Wire Works: "In your issue of Sept. 23d, page 203, it is stated that ons of the largest steel cshles on record was completed by the Globe Works, Liverpool, England, heing 3⅜ inches in circumferencs, 4½ miles long, msde of 42 wires, and weighing 25 tons. We beg to say that we have made a number of steel wirs cables much larger than the above, and that during the psst tbree years we have maoufactured four steel cables, eech 5 4-10 miles long, four inches in circumfersuce, weight 35 tons each, and numerous other csbles, probably 20, from four to fivs miles long, each four inches in circumference and weighing from 28 to 32 tons; and tbat we have now orders on hand for ons cable six miles long, 4½ inches in circumference, weight 42 tons, four csbles 5½ milss, and ten cables from 2½ to 4½ miles each. Moreovsr, all of our cables are made with 114 wires, as against 42 of ths ooe refsrred to in your valuable journal of Sept. 23d, and consequently cootain nearly three times the length of wire per mile. We have recently enlarged our steel tempering plaot to a capacity of 300 tons per month, and are not afraid to tackle any size order for steel cahles, and will goerantee, under forfeiture, that they will he superior to that English cahle." There is no doubt that the works cen do just what Mr. Wallis says.

The Union Iron Works have just shipped to Sierra county an nnusually heavy amount of machinery for a 20-stamp mill of the Mount Maria mine, American Hill, J. R. McIntosh superintendent. The stamps each weigh 1200 pounds, and the shoes are 9½ inches in diameter. 8 inches high; dies 9½ diamster by 7½ inches high. The outfit consiets of e 5x12 grizzly, 10x16 crusher, four ore-bin gates, four Challenge ore-feeders, 20 stamps, one traveling crab, 242 square feet of copper plate with two-ounce plating, one amelgam barrel, one wash tank, one gold retort, one 16-foot water-wheel, one water heater, wooden tanks, four Woodbury concsntrators; total weight of machinery, 140,000 pounds. The main shafting will be driven by low transmission from the water-wheel. Seventy-horse power will run the mill. Ths unnsual size and weight of the stamps are worthy of note. It is expected that they will develop a crushing capecity of six tons per 24 hours, with a drop of 95 to 100 per minute; and, if so, it is probable that they will be generally introduced in the mills of ths State. The rock-crusher is a Union-Blake's end weighs 14,000 pounds.

A Vulcan Wire Ropeway is now being erected at San Andreas de la Sierra mine Durango, Mexico, having been mads at and forwarded from the works in this city. The ropewsv ie 15,517 feet long, having one span of 1850 feet, and with a fall of 4100 feet for its entire length. In this connection it is not inappropriate to ssy something concerning the uss of wire ropeways, and particularly of the Vulcan. Iu mining districts where ths country is very mountainous, the expense of tranesporting ore, cordwood, charcoal, etc., to the mills is oftan very great, owing to the rugged contour of the ground, steep grades, etc., etc. In soch ceses, the system of ropsway transportation offers many adventages for economical transportation of such materials. For example an instance may bs cited where the cost of cordwood delivered at the mill was about $12 per cord. A Vulcan ropeway 10,000 fest in length was erectsd, and the cost per cord was reduced to $3. It is estimated that the entire cost of putting in the ropeway was covered by the saving of the first seven months of operation. The Vulcen Iron Works have lately put in ropeways at Ventanas mine, Mexico, and at Clipper mine, Kennett, Shasta Co., Cal. A ropeway has also bsen erected at Pomeroy, Garfield Co., Wash., for the transportation of wheat in secks from a tableland down to the Snake river. Ths ropeway system is available for a variety of materials, such as ore, hroken rock or material of similar sizes which can be carried in bockets; cordwood, for which a speciel wood-cerrier is used; wheat, charcoal or other materiel in secks, etc., et c In ceses where the ropeway is constructed on a grade, so that the difference in elevation of terminals is equivalent to a grade of one in seven, the ropeway will run by gravity, the carriers descending on one side and sending up the empty buckets or carriers on the other sids. Where the grade is not sufficisnt to develop power enough to make the ropeway self-operative, or is in a level country, some auxiliary power can be employed for operatiou. The power is connected with the ropeway by means of gearing attached to the end terminal.

Mining and Civilization.

NUMBER II.

In the remarks under the above head, Sept. 16, reference was more particularly made to the influence of the products of the mine. We come now to consider the position and influence of the miner himself. The world admires courage and perseverance wherever these qualities appear. It especially honors those who risk life and limb in the brutal "turmoil of battle;" but it considers too little the courage so often displayed in the ordinary and useful walks of life.

What greater evidence of true courage and commendable perseverance can be shown than is presented by the miner as he cuts his way through "stubborn rock or treacherous sands" in search of the metals, precious and useful, so needful to art and civilization? In his battles to win the object of his search, he often encounters more dread and more insidious dangers than the soldier who faces the serried raoks of an approaching foe. Where on the wide world's surface can be found such monuments of true courage and useful labor as are presented in the hundreds of miles of tnnoels aod shafts that have been bored into and through the mountains of California, to say nothing of ditches and flumes which traverse every hill and canyon from the snowy peaks of the Sierras to the sunny plains at their base? Where can be found the soldiers who have faced more dangers or suffered greater decimation than miners throughout the world who delve in the bowels of the earth for the coal, without which civilization and commercial enterprise would come to a standstill?

These tunnels, these shafts and these artificial waterways are the monumeots which will perpetuate the memory of the thousands of miners who have delved and perished in the work of producing the precious metals which have made modern progress and civilization possible, and furnished the means by which the machinery of the world's manufactures and commerce ls kept in motion to provide the necessaries aod comforts of the dwellers on the earth, whether rich or poor.

The miners are the motive power by which the world moves. Although they "delve in the dark, damp drifts" of the lower earth, they are *men* in the highest sense of the word—men who should exert far more influence and fill much more prominent positions in the "body politlc" than they do.

It is gratifying to observe that they are already beginning to assume the dignity and importance düe to their services. Their voices are already heard in the halls of our National Legislature, combating the schemes and plans which have been so cunningly devised to deprive *them* of their just rights, and to place the great general labor interests of the country at a disadvantage and in the power of the stock-jobbers and manipulators of the money rings of Wall street. As was remarked under another head in last week's issue: "The drift of legislation and judicial decision has, of recent years, been uniformly against the miner, but he has now the spirit aod strength to stem the tide and to turn the current in his own direction."

Mining has become a leadiog branch of American industry, second only to that of agriculture. To-day no broader field to wealth and honor lies open to our young men than the husiness of mining and scientific metallurgy. Time was, and but a few years ago, when there was a great lack of men properly educated for this business. It was a new branch of industry to our people on both sides of the continent; but now we have reasonable facilities in the way of mining schools and mining experts at practical work, where young men may acquire a thorough knowledge in every department of mining and metallurgy.

Every miner who is ambitious to advance in his profession should observe and study whatever pertains to the practice and science of mining. In no other way can he hope for preferment. The science of miniog is exceedingly broad in its scope. The miner should have a practical knowledge of geology. Surveying is a very important acquirement. Chemistry is a science most intimately associated with mining in various ways. Mechanics is another science without which oo one can become proficient in any departmeot of mining. It is not necessary that miners should become expert in all these branches; but it is important that they should adopt habits of close observation and read and study intelligently in all these departments of knowledge. The miner who will thus apply himself will most assuredly pave the way for, and ultimately reach, such advancement in his profession as will lead to independence, fortune aod honor.

We need more educated men in this profession to the end that they may feel sufficient interest in themselves and their calling to assume the dignity and position appropriate to their employment, and be ready and able to assert and protect their rights against all assailants.

Beiog a leading industry, and in the direct march of civilization and progress, it should he the policy of our Government to encourage, by every reasonable means, the further development of mining. The business should have its own advocates, and be able by its own men to direct popular attention to the matter of its needs and to the immense wealth that still lies hidden in the bosom of the earth waitiog only for the hands of labor to draw it forth.

California possesses a combination of natural resources and opportunities fouod nowhere else oo earth. With a soil of exuberaot richness; with a climate semi-tropical in character; with unmeasurable water-power, which, by electrical appliances, can be brought to every town and hamlet; with mines of inexhaustible richness; and standing upon the western border of civilization, and looking over upon and commanding the growing commerce of the magnificent East—how can we calculate the possibilities before us? Can such advantages with proper effort fail to crown our early future with a wealth before which ancient oriental affluence must surely pale?

James D. Hague, principal owner of the North Star mine, has bougbt the Rocky Bar mine, Nevada county, one of the oldest and best properties in Grass Valley district. Mr. Hague has owned the New York Hill, tbe adjacent property, for some time, and it will probably be worked through the Rocky Ber. Negotiations are also pendiog and whicb will probably result in the Stockbridge, the Messachusetts Hill, the Ford & Reilly and the Great Britain claime passing uoder tbe control of Mr. Hague. The Rocky Bar was sold by Wm. Watt to the recent owoers some years ago for $22,000. Since that time a great deal of development work has beeu done and the mine has yielded handsomely. The shaft is down 700 feet, but of late years no work has been done below the drain tunnel, and what hae been done has been mostly by tributere. The new company has formed witb the following as directors: Jas. D. Hague, E. R. Abadie, Ches. E. Clinch, Fred Searls and Thomae Marshall. The directors orgaoized by electing Mr. Hague, president; Fred Searls, vice-president; Thomas Marshall, treasurer.

Much interest in the approaching conventioo of the Minere' Association ie taken throughout the mining counties. The various local organizatione are prepariog to elect delegatee, or have already elected them, and discussion as to the purposes of the convention is going on in local papers. Altogether the outlook for a large attendance and a very interesting and important session is excellent.

Studies in Gold-Milling.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by J. A. EDMAN.]

Instances are frequent where silica appears as a coating on the gold and preventing its amalgamation, but almost exclusively in treating highly decomposed and oxidized ores. The silica is not here the fragments of hard quartz from the matrix, but appears to be films of amorphous hydrated silica, generally almost transparent and deposited from solutions percolating through the ore; and the gold affected, often appearing as films, delicate filaments and arborescent forms, can probably be referred to the same agencies, namely, precipitations from solutions originating in the lodes or their wall rocks. Such silica films have been found on the hard and often nodular masses of pyritous quartz surrounded by soft and friable vein matter, and also in microscopic fissures in the wall rocks of such lodes, together with limonites and occasional coatings and druses of crystalline quartz. In fact, much of the difficulty in milling decomposed ores is due to the presence of gelatinous silica, which increases the density and thickness of the pulp resulting from the suspended clayey matter already present, and which cannot be counteracted by chemical means in the large stream of water issuing from a battery of stamps, but which can, to great extent, be remedied in grinders, such as arrastres and pans. Too much stress cannot be laid upon the already abundant evidence, fully proven by the writer's experience, that the presence of hydrous oxides of all kinds, as well as of silica in that condition, presents most serious difficulties in the treatment both of gold and silver ores by amalgamation, the action set up in the pulp by such minerals being both mechanical and chemical in its nature and so far but little investigated. Where such ores can be economically dehydrated, as by a calcination previous to crushing, a great improvement in their yield of metal becomes immediately apparent, and the nature of the pulp quite different from that of the original ore.

In support of this theory and in contrast with the experience gained in some of the large lodes of decomposed ores constantly permeated by moisture and so often met with in California, and which, from the above-stated reasons, generally have proven disastrous failures, may be cited the case of a series of gold-bearing veins, to great extent made up of oxidation products and a variety of altered minerals probably originating under nearly the same conditions, now prevailing in the mountains of California, but where long ago such action ceased and nature for ages has entered upon a dehydrating process by denying the prime element of chemical changes, namely, abundant moisture. This is strikingly illustrated in the celebrated Harqua Hala mine of Arizona, notable not only for its generally high-grade ores, but for the facility with which its very much diffused gold can be saved by ordinary battery and plate amalgamation, and this, in spite of the fact that owing to the scarcity of water the supply for the battery has to be used over again after being settled in reservoirs. In this mine much of the gold is microscopic in size and the heavy mineral wulfenite is present in large quantities. Although concentrators are used, their products contain but little free gold or amalgam and the tailings are very poor. The explanation is found in the fact that the gold particles are very bright and free from coatings, and that the ores, although mainly made up of earthy and metallic oxides, have become almost anhydrous, and are likely to remain so, no water or even moisture being found in the deepest workings of that mine.*

In attempting an inquiry into the condition in which gold exists in the associated minerals of gold-bearing lodes, such as the sulphides, arsenides and antimonides, and to solve the question whether the gold therein is metallic, or chemically combined, there is little authentic information to guide the investigator. The microscope so far has shown the forms under which metallic gold occurs in these minerals, and its evidence points strongly to the probability of chemical combinations both in pyrites and in arsenides, from the form, aggregation and condition of the gold visible in the oxidation products of these minerals. It is in evidence that gold-bearing pyrites have, within limited zones, been bodily leached out, leaving empty cavities retaining the shapes of the cubes, while in but few instances a silicious skeleton, alone or supporting gold in minute filaments, remains behind. Minute crystals and delicate wire gold are frequently noted among decomposing arsenical pyrites and antimonial sulphides. On the contrary, instances are quite rare of the leaching out of metallic gold from hard or even moderately compact quartz while in place. In the same lodes, where a leaching action is patent, evidences are also abundant of metallic gold having been deposited from solutions, together with and in the midst of other products of leaching, such as limonites, xanthosiderites, gothites, limnites and many manganese-copper and lead-bearing oxides, and this coupled with the admitted solubility of gold sulphide in alkaline sulphides, gives indirect evidence of its occurrence in some combinations more easily soluble than metallic gold.

The minerals distinctly traced and noted both in bulk and under the microscope, and in which chemical combinations cannot be doubted, are the tellurides and selenides of gold and silver; but this fact is frequently lost sight of by miners and millmen of this coast, who have had but little knowledge of and less benefit from the experience gained by the miners of Colorado in the treatment of their very rich tellurides. The available literature on the occurrence and treatment of these ores is very scant, even late text books on the metallurgy of gold almost ignoring the subject, while their successful metallurgical treatment is confined to the smelting works of Colorado.

Although the various gold-bearing tellurides have long been found in California from Mariposa northward to Plumas and to Shasta counties, but little reliable information on the subject can be had except the meager data in the older reports of the State Mineralogist. Their occurrence, therefore, has been considered exceptional, and their study has been neglected. Of the gold-bearing selenides still less mention has been made, and they are scarcely known to the gold-miner. There is no doubt but that closer and more extended examination of concentrates and ores will develop their existence in many mines often where least suspected, and the waste of much valuable mineral may then be prevented. Wherever concentrates are exceptionally rich, their presence may be expected, and microscopical examination of the raw or roasted concentrations has often proven the presence of one or both of the above-mentioned gold minerals, often of exceeding value.

Exceptional facilities for studying selenides have been afforded the writer when treating the ores of the Diadem mine, of Plumas county, Cal., which is situated on a large lode of very decomposed vein matter, and generally furnishes striking illustrations of various progressive changes by infiltration, oxidation and deposition. Here in a certain zone, marked by the occurrence of large bodies of dolomite, and at a depth of 300 feet, the selenide of gold and silver is found, associated with the selenides of copper and of lead.

The characteristics of the pure selenide of gold and silver are as follows: Color, bluish-black to black; lustre, metallic, splendent on some faces of crystals; isometric; cleavage cubic, perfect; generally found granular and in crusts. Specific gravity, 8 to 8.5; hardness, 2.5. Composition, (approximately), selenium, 64 per cent; gold, 32 per cent; silver, 4 per cent. Before blowpipe, melts easily on charcoal to a black globule, evolving fumes of selenium; with soda gives first a grayish yellow, then a bright gold-colored bead, which is brittle and nearly silver—white internally; after long refining with soda and borax a malleable gold bead is obtained.

As the pure mineral is found in very small quantities, the specific gravity and composition have as yet not been accurately determined.

The selenide of gold is here always found associated with metallic gold, grains and films of which are occasionally found penetrating the minute cubes of the mineral. The rich ores consist of white granular or yellowish gray banded and sugary quartz, often honeycombed, in which the selenide occurs in small black grains or gray blotches and stains in the quartz, often extremely diffused and then showing under the microscope as minute black filaments. The richest ores, sparingly occurring, are dark gray, show some metallic gold, and give by assays up to $10 per pound. In the average ores below $100 per ton, the selenide is seldom visible, but appears in the concentrates as small black cubes, quite a variety of pyrites and grains of wulfenite always accompanying such ores.

The selenide of gold and silver, as above noted, can only with difficulty be distinguished from many other abundant minerals. Where manganese oxides are present and stain the ore, the selenide can only be recognized by fire test, the more so as the encrusted selenides often contain a large percentage of manganese compounds, such as Psilomelane and Wad. The selenides of lead and of copper resemble it closely, and when granular it may easily be taken for galena, the crystal form and cleavage being identical. The rich ores of black tellurium also resemble it.

The following simple test will often suffice to distingulsh the richer selenide ores from those resembling them externally, except from the tellurides. The hard ore, broken into pieces of one-half to one inch in size, should be placed in a sand crucible and moderately heated. A little nitrate of potash should then be sprinkled upon it so as to reach most of the ore, after which the crucible should be kept at a red heat for nearly half an hour, while only loosely covered to prevent coal from dropping into it. After gradual cooling, gold in globules, often quite minute, will be found on the glazed surface of the ore, if selenide of gold is present. If the mineral is much diffused in the ore, it may be necessary to heat the sample for an hour and apply more nitrate. Blowpipe trials on small fragments will give the same result with soda, but a long-continued heat is needed to reduce the gold to a metallic state.

In view of these considerations and the fact previously stated, that the free gold in selenide ores cannot be recovered by ordinary amalgamation, it becomes apparent that such ores cannot be profitably treated, except by smelting. Even with low-grade ores where smelting could scarcely be practicable, and crushing with careful concentration must be resorted to, a great loss cannot be avoided both from the friability of the mineral and its extreme diffusion. After such treatment the concentrates should be smelted. For very rich ores (from $1 to $20 per lb.) crucible smelting on a small scale with lead or litharge and soda may be used to advantage, with cupellation of the rich lead resulting.

The selenide of copper found at the Diadem mine in association with the gold mineral, is deep black in color, moderately lustrous, generally in irregular grains or imperfectly crystalline, and is often coated by a leek-green translucent mineral. It often contains enclosed grains and scales of metallic copper. The selenide of lead is rare; it resembles clausthalite, but is generally found decomposed into a yellowish gray ochre.

It is an interesting fact that all the occurrences of gold-bearing selenides noted by the writer, as well as most of the valuable telluride ores exploited in California, have been found in conjunction with lime-bearing rocks, chiefly calcite and dolomite, which peculiarity should not be lost sight of in further explorations for these valuable but much neglected ores.

*The writer is under obligation to one of the former owners of the Harqua Hala mine, Mr. A. G. Hubbard, for a full line of samples furnished him of the ores from that mine and some of its mill products, the examination of which, under the microscope, throws much light on lode formations in general and furnishes important evidence on the points above cited.

Specific Gravity of Gold in Gold-Silver Alloys.

[Paper read by Henry Louis, Singapore, Straits Settlements, before the Chicago meeting, American Institute of Mining Engineers, August, 1893.]

Four alloys of gold and silver were prepared, containing the metals in the following proportions by weight:

1. Gold : Silver : : 1 : 2.62.
2. Gold : Silver : : 1 : 3.15.
3. Gold : Silver : : 1 : 4.11.
4. Gold : Silver : : 1 : 5.17.

These alloys were rolled, with repeated annealing, into thin strips, rather thinner than is usual for assay-cornets. The strips were thoroughly annealed, cut into pieces and dropped into hot parting acid. They were boiled twice with No. 1 parting acid for one hour and ten minutes altogether, and then with No. 2 parting acid for thirty minutes, washed thoroughly with boiling distilled water, and left under water under the exhausted receiver of an air-pump for 30 hours.

Their specific gravities were then taken with the following results, the temperature being 15° C.:

No. of Experiment.	Weight of gold in air.	Weight of gold in water.	Weight of equal bulk of water.	Specific Gravity.
	Grains.	Grains.	Grains.	
1.	9.408	8.946	0.462	20.36
2.	13.897	13.209	0.688	20.20
3.	13.627	12.956	0.671	20.31
4.	13.170	12.566	0.604	21.8

The quantities operated on were very small, and the balance and weights by no means first-rate, so that the results are not likely to be very accurate. The first three results are sufficiently close together, but the very high figure obtained in the fourth experiment must, in all likelihood, be due to some error. Hence, it will be safest to average the results of the first three experiments, and, pending a more complete and accurate investigation, which I hope to make of this subject, to take the specific gravity of the gold residue left on dissolving the silver-gold alloys at about 20.3 at 15° C. Apparently, the varying proportions of the two metals in the alloys do not affect the result.

Gold thus left, on dissolving out the silver, is highly spongy, and, on annealing, it undergoes a very evident shrinkage. The result now obtained proves that, on annealing, the molecule of gold does not contract, but, on the contrary, expands, the shortage of bulk being due to a diminution of the physical interspaces between the particles of gold, while the interatomic distances must increase, the diminution being, of course, greatly in excess of the increase.

With regard to the figures here given, it may be noted that Rose obtained, for the specific gravity of precipitated gold, results varying between 19.49 and 20.72. His figures, taken together with mine, seem to point clearly to the existence of a heavy allotropic modification of gold. It is of

course possible that the brown amorphous gold obtained, either by precipitation or by the removal of the silver from a silver-gold alloy, may be a mixture of ordinary and allotropic heavy gold, in varying proportions. There can, however, be little doubt of the allotropism and of the further fact that gold exists in the alloy in this allotropic form.

A further partial and indirect justification for this latter statement may be found in the experiments of Matthiessen on the specific gravity of alloys (*Phil. Trans.*, 1860, p. 177), in which he shows that the observed specific gravities of gold-silver alloys exceed the calculated ones (calculated upon the specific gravity of ordinary gold) in the ratio, approximately, of 1 : 0.997. This would appear to suggest that the gold in these alloys is in a heavier state than ordinary normal gold, but any conclusions based on these observations are liable to modification, seeing that it is not yet known in what condition the silver in these same alloys exists.

It is possible that these results may afford a clue to the explanation of the widely different specific gravities found by different observers of native gold specimens (containing silver), of approximately the same composition, but from different localities.

In order to complete our knowledge of this subject, it will be necessary to study the character of the gold by dissolving out the alloying metal from a series of alloys of gold with different metals, and I hope to be able to undertake this investigation before long.

Limitations of the Gold Stamp Mill.

[Paper read by T. A. Rickard, of Denver, Colo., before the American Institute of Mining Engineers, August, 1893.]

IN TWO PARTS—PART I.

Milling is one of the metallurgical arts whereby the extraction of the largest possible portion of the value in an ore is effected at the least possible expense. Stamp milling is that particular process in which a heavy body of iron is caused to fall upon the ore so as to disintegrate it and thereby induce a separation between what is valuable and what is worthless. The latter is usually less in specific gravity, and is therefore, by the further aid of water, removed from the former, which is then collected by the use of mercury.

Several similes have been employed to describe this process. The stamp has been likened to a hammer of which the stem is the handle and the die the anvil. The ore upon which the stamp falls has been compared to a nut awaiting the descent of the hammer whose blow is to separate the valueless shell, the quartz, from the valuable kernel, the gold.

When we begin to pursue our inquiries, however, we find that the analogy is just sufficiently true to emphasize the departures from it. The hammer falls, the anvil is fixed; so with the stamps and the mortar. The anvil is made of softer metal than the hammer; so also the die is often, and should be always, of steel or iron less hard and more tough than that of the shoe. The movement of the hammer and the drop of the stamp are both intermittent.

In regard to their intermittent action, as in many other respects, stamp mills arrange themselves under two types, which, though apparently contradictory, have both been evolved from a common original, and are united by a great variety of intermediate modifications. The slow speed and the high drop of the mills of Gilpin county, Colorado, appear to have very little in common with the fast speed and short drop of those of the main gold belt of California; yet the practice of one was largely derived from that of the other, and each has been adapted to the treatment of the ores of its particular region.

The first and most apparent difference is that of speed. In Colorado the drop is regulated at 30 per minute, while in California it averages from 90 to 105. The more rapid drop gives a less intermittent action, and in this respect more nearly approaches the ideal machine.

The work done by the hammer is, however, dependent not only on the rapidity of its blows but also on its weight and the distance through which it falls. Keeping to the two types, which we have chosen as representatives of the two systems of milling, we find that in Colorado the stamp weighs 550 to 600 pounds and falls a height of 18 to 20 inches, while in California the stamp weighs 750 to 850 pounds and drops only 4 to 9 inches. Upon multiplication of these three factors—weight, drop, and speed—we find that the theoretical work done is nearly equal and is about one-horse power.

In milling, however, the efficiency of the stamp as a crushing machine is gauged by the quantity of the ore which it can reduce, and we find that this does not at all correspond to the theoretical equality of the mills. In Colorado the stamp crushes one ton per 24 hours, while in California, with ore of similar hardness, the amount is from two and a half to three times as much. Why is this difference? To explain it we must suppose the hammer to fall not upon the dry and wide surface of an anvil, but upon a face of iron confined within a narrow box and under water. The box corresponds to the mortar or coffer of the stamps. It has no opening save in front, where a metallic opening or screen permits the escape of only that part of the material which has been crushed sufficiently small to pass through the openings. The ore upon the die is under water. The depth of that water depends upon the level of the bottom of the aperture occupied by the screen frame. In Colorado the depth of discharge, as measured by the distance from the bottom of the screen to the top of the die, is 14 inches, but in California it is 4 inches only. Herein lies the key to the difference in the crushing capacity of the two mills. Though the same amount of power be expended, and though the screen used be of similar mesh, yet in the Colorado mill the stamp falls through 10 inches more of water and has to discharge the pulp at a level 10 inches higher than in the California mill. The greater depth of discharge deadens the effectiveness of the blow of the stamp and weakens the force of the splash. Another result is obtained. While the screen does not in either case succeed in sizing the material discharged through it, yet it will be found that, though provided with similar screens, the pulp issuing from the deep mortar has a fineness much greater than that discharged by the shallow one. The pulverized ore is retained by the deep mortar long after its particles have been crushed to a size permitting their passage through the screen openings, and they therefore become repulverized to a further degree of fineness.

This touches upon one of the points in respect of which the stamp mill is most faulty. By actual test it is found that, though using a 40-mesh screen, for instance, with the theoretical supposition of crushing to that particular size, yet in a Colorado mill fully 70 per cent of the pulp, and in a California battery about 50 per cent, will pass through a 100-mesh sieve. The percentage varies with the character of the ore, but these figures may be considered fairly representative. Two causes are chiefly responsible for this. The most important in its effects is the pause which occurs between the successive drops of the stamp. In a Colorado mill the interval is two seconds; in California it varies from three-fifths to two-thirds of a second. Particles of ore, which have been pulverized to a fineness which would permit of their exit through the screen, are enabled to settle towards the bottom of the mortar. It would be expected that the heavy metallic minerals occurring in the ore would, because of their greater specific gravity, be most affected by this feature of the treatment. In practice this is found to be so. The fine slimes contain a large proportion of metallic sulphides, generally valuable on account of their close association with the precious metals, while the coarsest particles to be found in the tailings usually consist of quartz and other minerals forming the less heavy gangue.

The want of any proper control over the regular sizing of the pulp is also due to the unequal and irregular splash of the water in the battery and the hap-hazard way in which the particles of pulverized ore strike against the screen. In the case of any single particle, for instance, it is a question of hit-or-miss whether it be thrown against an opening or a blank. If it fail to pass through, it is thrown back by the recession of the water and undergoes a further agitation and probable pulverization.

In practice this feature of the stamp mill is recognized by both the California and the Colorado millman. On the Pacific coast the mortars are made narrow, thereby diminishing the opportunities for the settling of the particles of ore, and, by increasing the force of the splash, adding to the chances of its exit through the screen. In late years there has also been a tendency to use wire cloth in place of punch iron, for the reason that the former, though having openings of identical size, yet has more of them per square inch than the latter, and, therefore, presents a greater area of discharge. By giving an inclination of 10 degrees to the screen-frame, the exit of the pulp is further assisted.

In Colorado, this defect of the stamp mill has been utilized, and has been made an assistant to the millman. The mortars of this district are wide and roomy, the splash of the water inside the battery is weak, and the pulp remains inside until pulverized to a fineness much exceeding that required for its passage through the screen. There is a reason for this apparently contradictory feature of the milling practice. To explain it we must glance at the ore. We find it to contain an average of 15 per cent of pyrite. The gold is very fine and intimately associated with the pyrite. To separate them it is necessary not only to crush to a certain degree of fineness, but also to obtain conditions which will permit the gold when once separated to settle upon amalgamated plates placed inside. The deep discharge caused the pyrite to remain in the mortar-box long after it has been pulverized to a size smaller than the screen openings; the long drop gives the interval of time required to allow of the settling of the fine gold, while the roomy character of the mortar aids the deep discharge in affording a chance for the gold to get out of the way of the falling stamps and to become amalgamated upon the two copper plates inserted at the back and front of the mortar. In this way about two-thirds of the total yield of amalgam is obtained inside the mortar. In California the introduction of plates is not admissible, in mortars having so shallow a discharge as four inches, because the more constant and more violent agitation of the pulp prevents the settlement of the gold and would cause the abrasion or "scouring" of the surface of amalgamated plates. A certain varying percentage of the gold is, indeed, usually arrested inside, partly by the aid of mercury added to the ore as it is fed into the battery, but this is of such a coarseness that gravity alone would serve to keep it within the mortar.

We have now entered into the discussion of the effects produced by the action of the stamp upon the ore. In many respects it departs from the analogy of the hammer which cracks open a nut. While being lifted the stamp also turns. This is effected by the friction of the cam surface against the under side of the tappet. In a slow-drop mill the stamp makes a complete turn each time it is lifted, but with an increased speed this action is more uncertain and from 4 to 10 drops are required to make a whole revolution.

This feature of the stamp mill breaks the analogy to the hammer and anvil and causes it to resemble the pestle and mortar. The turning of the stamp in rising is communicated to the ore when it falls, and induces a grinding action, which has important results. The mere impact of the stamp upon the particles of gold has the effect of hammering it, of increasing its density and of preventing its amalgamation, while the turning of the shoe upon the die causes the abrasion of the surface of the gold and the rubbing off of any film of foreign matter, which, by preventing contact between the gold and the mercury, is prejudicial to amalgamation. In grinding the ore the stamp, however, also tends to convert it into slime. The hammer which cracks open the nut liberates the kernel without smashing it, but in pursuing the simile we find that the stamp not only breaks the shell, but both the kernel and the shell are further crushed and their particles become confused together. The stamp which frees the gold from the quartz has to deal with a material in which the valuable and the valueless constituents are so uneven in size and so intermixed that the one is often crushed too much and the other too little.

I have seen auriferous quartz which very nearly approached our simile of the nut. The gold occurred in seams and cavities in a quartz which had a honey-combed character. With such an ore there is just a certain blow which will break the brittle quartz and liberate the ductile gold. Such ideal conditions are very rare. The different parts of the same ore usually vary both in hardness and composition. The same work done on two pieces of mill-stuff will produce entirely dissimilar results. In the stamp battery the heavy sulphide minerals are pulverized to a greater fineness than the siliceous gangue. When the gold is not too closely associated with the pyrite, coarse and rapid crushing will produce an adequate separation; but when the metal is in a finely-divided condition and very intimately mixed with the pyrite, then fine crushing is demanded, and can, unfortunately, only be obtained by the production of a very undesirable excess of slimes.

One More Prehistoric Toad.

TO THE EDITOR:—The Tacoma toad mentioned in your issue of the 26th ult. as being resurrected from under 17 feet of hardpan reminds me of a similar case I witnessed when a boy 11 years of age, in 1848, in Oxford county, Canada.

It was a dry autumn, and the family well, about 15 feet deep, and then in use seven years, "went dry." It was deepened to the extent of three or four feet. The extra sinking was partly through a soft sandstone and shaly rock, some of which, however, was hard enough to answer for the additional curbing required. When these stones were being broken to fit them for use in the well, one of the softer of those broken disclosed a cavity, and out dropped a curious-looking, medium-sized toad, nearly the color of the rock.

To all appearances the toad was dead. All the members of the family were called, and the man from the well, to see the curiosity. The cavity was but little larger than its occupant. The stone or soft shale had broken into two pieces, and these, when fitted together, showed clearly a sealed cavity. While we were all wondering at the circumstances, his toadship added to our surprise by recovering consciousness and hopping about. He was seen a number of times the next few days in and about a cluster of weeds in which he had taken refuge, and was always readily recognized by his peculiarities.

I have not related these facts for more than 20 years, because of the lack of credence they were invariably received with, but now that I see a well-authenticated parallel case on record I repeat them. F. C. GARBUTT.

Mechanical Progress.

New Railroad Snow-Clearing Device.

George H. Johnson of Sisson, Cal., has secured a patent on a device to clean thoroughly the inner sides of the track rails of snow which lies in the path of the wheel flanges and ordinarily gets impacted, forming an obstruction to progress with a tendency to increase. This device is adapted to he secured directly forward the engine trucks. The device comprises primarily a transverse heam linked to hangers, the heam heing provided at each end with a peculiarly formed scraper of metal, having a snout or lip depending ahout half way down the rail, or some deeper than the reach of the wheel flanges. This scraper point is inclined like a plow point and scoopes up the snow, which is deflected outwardly hy a curve in the plate. It is the ohject of this invention, furthermore, to adapt the device to he raised out of operative posltion when not required. For this purpose, angle levers are pivoted in hangers from the main frame, and connection ls made from one of the angle arms by a rod to an air cylinder. In operation, the points of the shovels or plows travel along the inner side of the head nf the rail and to a depth about equal to or a little greater than that of the wheel flange. Their position is regulated hy the swinging movement of the frame which carries them, wherehy they may not only he set to the required depth, hut can be raised entirely out of the way when necessary. The normal position is a elevated one, in which they are entirely out of operation. This is due to a spring forcing the piston forwardly, which, through its rods, draws the lever rod backwardly, and this rod, through the angle lever, raises the lower end of the frame, the frame turning ahout its pivoted link connections and lifting the points of its shovels or plows ahove the rails. When it is desired to throw them down for action, steam or compressed air is forced in, forcing the piston hackwardly, and hy reversing the movements of the parts heretofore described, throws the frame downwardly so that the points of the shovels or plows are hrought down to position and are held there by whatever pressure may he necessary.

Ferris' Great Wheel.

As a mechanical triumph the Ferris Tension Wheel stands out holdly as one of the wonders of the age, horn in Chicago and the creation of Mr. G. W. G. Ferris, Pittsburg, Pa. That the Ferris Wheel surpasses Eiffel Tower of the Paris Exhibition there is no doubt, and it is a more wonderful achievment hecause it was a venture on unknown grounds, while the Eiffel Tower was constructed on well-tried scientific prlnciples. This immense structure, consuming in its various parts over 4000 tons of iron, 2600 tons of this heing in motion, under control of two immense engines, rises ahove Midway Plaisance 264 feet. The 36 coaches are models of comfort and are daily filled with passengers who enjoy the magnificent scenery and the cool, exhilarating amusement. These coaches hold 60 persons comfortably, giving a comhined carrying capaclty of 2160 passengers.

There is ahsolutely no danger ln riding on the Ferrls Wheel, as every precautlon has heen taken to provide against accident, and all persons who ride once are anxious to go again and hring their friends to enjoy the heautiful scenery.

The 36 cars used to convey passengers around the wheel are perfect in construction and admirahly adapted to this peculiar use. These cars are 13 feet in width and 26 feet long, containing 40 chairs for passengers, although the carrying capacity of each car is 60 people. They are built of yellow pine, with cnrrigated iron roof, and in all details of construction are strong and durahle. The windows are of three-elghths inch French plate glass calculated to resist the strongest wind. There is no great motion in the cars as the wheel revolves, owing to the manner of their suspension on six and one-half inch steel trunnion pins, which pass through the outer cord.

A New Rowing Device.

A local inventor has devised a new scheme (or rather a new modification of an old scheme) to drive row-hoats hy propeller propulsion. The "oar" handles are only ahout two feet long, and lnstead of terminating in hlades they connect with metal rods which lead aft to either end of a screw-slotted crosshar. Through this slot runs the propeller shaft, which for ahout three feet of its length has a screw thread. By applying the oar leverage to the cross-har, the shaft obtains a rotary motion from the screw thread, and on the recovery of stroke the slot opens so as to permit the bar to slide back without givlng it a reverse turn. It seems very complete, even to a contrivance that reverses the opening and closing of the slot ln order to back water, and not the least of the merlts claimed for the invention ls that the oarsman faces the how instead of the stern, although applying his muscle in the same directlon as in ordinary rowing.

The scheme will probably work, but lt will doubtless be found that no increased speed over ordinary methods will be ohtained.

Doing Away with the Dead Center.

A new crank which does away with the dead point is the asserted invention of a French engineer. The crank-pin works ln a slot cut in a steel disk fastened to the end of the shaft, and is pressed upon hy a spring, which is so adjusted that at the ordinary working steam pressure it is held firmly in place. If, however, the crank he at a dead point, when the full pressure of the steam is admitted into the cylinder, the spring is compressed, the crank-pin slides into the groove so as to assume an angular pnsition to the shaft, and the latter begins to revolve. As the pressure of the steam in the cylinder, while the engine is in motion, is less than in the boiler itself, as soon as the shaft hegins to turn, the pressure against the spring is relieved, and the crank-pln flies back to lts usual position. The tension of the spring is adjusted as necessary.

Wear in Wrought-Iron Bridges.

Speaking at the Engineering Congress at the World's Fair, Sir Benjamin Baker stated that in examining old wrought-iron bridges he had found that the hridges had suffered most at the joints, and not at places where the strain sheets would show the greatest fatigue. In the case of hridges having trough floors, for example, he had found that the failures were serious where the flooring was connected to the webs of the main girders. He had seen the web plates nearly cut through with the wriggling of the connections, and considered it to he better practice to put the troughs directly on top of the angle-plates. In other riveted parts he had found the greatest wear from the loosening of the rivets.

Compressed-Air Transmission.

It was stated in a recent lecture by Prof. Unwin, that compressed-air transmission ls practically up to at least 20 miles; 10,000-horse power can he transmitted 30 miles in a 30-inch main at 132.3 pounds per square inch, with a loss of pressure of only 12 per cent; the efficiency is 59 to 73 per cent, if the air is reheated and 40 to 50 per cent if lt is used cold.

One Hundred Miles an Hour.

Messrs. Duhbs, the well-known locomotive builders, of Glasgow, have in hand a monster express locomotive, designed by Mr. Michael Reynolds, consulting engineer, Wolverhampton, which constitutes a complete departure from modern practice. The horse power is 2000, and the speed 100 miles per hnur. The driving wheels are 12 feet in diameter, and there are three cylinders of 48, 28 and 18 inches in diameter, with a 30-inch stroke. The boiler pressure is 205 pounds. It is proposed to run from London to Edinburgh—500 miles—in six hours.

Aluminium for Bullets.

Dr. C. E. Parent, of this city, proposes to make bullets from alumlnium. He hases hls claims upon the superior hardness and lightness of aluminlum; says the soldier could carry more ammunition; that it would not flatten against a bone and produce a ragged wound, as lead does, and would not he so likely to poison the wounded man if the bullet could not be extracted. He does, however, insert a piece of lead at the point of the bullet to give it weight and control its flight.

Steam for Buggies.

A steam huggy is being built in Boston. The wheels are like those of the safety bicycle, with seats for two over the front pair, and the hoiler, water and naphtha tanks hetween the rear wheels. The engine is vertical, 2x4-inch cylinder and 4-inch stroke; it communicates power to the rear drivers by a chain gear. The gulding is done hy the front wheels and all controlling devices are under the hand of the operator. The total welght of the vehicle is 400 pounds and a speed of 10 miles per hour is expected.

Brakes to Help Start Cars.

An attempt is belng made in England to utilize the power ahsorhed in the application of the brakes to tram cars so as to render aid in restarting the car. A spring is charged, which can he released and will start the car without the aid of the horses. A forward and not a recoil movement is at once given to the wheels, but its action can he reversed in case of need—such as to overrunning points at junctions.

Scientific Progress.

The Telotype.

The telotype, or electrical typewriter, has heen designed to meet the requirements of a rapid and reliable printing telegraph instrument—a thing long needed. This instrument is manipulated very much in the same way as a typewriter. The transmitter, as well as the receiver, makes a copy of the message, and the llahility of mistakes ls thus largely decreased. The instruments work ln unison, and it is impossible to send a message from one machine unless the corresponding machine at the other end of the line is properly receiving. The record ls plainly prlnted on the strip of moving paper in front of the operator. The fact that the message is printed at the other end of the line without any personal attention makes the arrangement an exceedlngly valuahle one. The same instrument can send and receive. This new method of telegraphic transmission is said to have given great satisfaction wherever used, and is no doubt destined to extended employment.—The Ohio Valley Manufacturer.

Evidence from Ashes.

An officer of the Mint at New Orleans has been arrested and committed for trial on remarkahly scientific evidence. It was his duty to burn the bills which were returned to the Mint and were not to he relssued, says the *Christian Herald*. A box containing a large amount of money in currency was given to him to destroy, and a record was kept of the number of blls of each denomination which were in the box. The ashes of the hills were carefully collected and turned in by the clerk, as proof that he had destroyed the hills, as his duty required. They were weighed hy the chief inspector and were ahout the weight that the ashes of the bills should he. On close examination, however, it was found that among the ashes were the heads of several hurnt matches, which would, of course, count in the weight. It was evident that certain hills, the ashes of which, if burned, would correspond in weight to the match-heads, could not have been burned. Suspecting that the clerk had stolen the hlls, instead of hurning them, the next step was to ascertain the value of the hills abstracted. The ashes were submitted to a Government expert, who analyzed them and reported that currency of the value of $25,000 had not heen burned. On heing asked how he had discovered the amount, he stated a fact not generally known. It appears that the coloring matter used ln the hills varies with each denominatlon, and that in all cases it has a metallic hasis which ls unlnjured hy fire or water. The tests showed that in the ashes there was none of the indestructible basis peculiar to the one thousand, five hundred, or one-hundred dollar bills, although there were several hills of those denominations among those given to the officer to hurn. As there was a possihility of his havlng used them, instead of hurning them, he was arrested. Douhtless the officer was not aware that the Government possessed so ingenious a means of testing his prohity, otherwise he would not have reserved the bill from destruction.

Aluminium Flashlight.

Professor Glasenapp emphatically advocates the use of aluminium in place of magnesium for the production of flashlight. He states that aluminium, if employed in the form of hronze powder, is equal to magnesium as a source of light in taking photographs hy flashlight, and that lt is much cheaper than the latter, says the *Scientific American*. The followlng mixture is recommended hy the author:

Aluminium	21, 7 parts by weigbt.
Sulpbide of antimony	13, 8 " "
Potassium cblorate	64, 5 " "

In preparing this mixture the same precautions are to he taken as in the case of magnesium flashlight. As the rapidity of combustion of the above mixture, one-seventeenth of a second has heen found out. Two grammes of the mixture were burnt in a small heap, 2 cm. long and 1 cm. wide. With regard to the chemical intensity the author has found, hy exposing gelatine plates heneath a Warnerke actinometer to the light of the above mixture and to that of other mixtures prepared with magnesium, that hy employing equal quantities of metal the aluminium light is superior to the magnesium light, though not very considerably. The speed of combustion is slower (about one-fifth of a second) if the following mixture is used:

Aluminium powder	30 parts by weight.
Potassium chlorate	70 " "

To Duplicate Hand-Writing.

An interesting invention hy an Italian nohleman, Marquis Fontl, is described at great length in a late issue of *La Nature*. It is called the higraph, and, as its name implies, is desigued to produce a fac-simile of a writing at the same tlme the original is made. This ingeninus device is provided with two pens which are supported hy the framework in such a manner that their points are always in the same horizontal plane. The pen to the right hand is intended for the operator or writer, and the last stroke made hy this pen is at the same tlme duplicated hy the one on the left. The framework is so jointed and hinged that the pens can be moved in any direction. A counter-halance takes the weight of the frame from the hand, so that the act of writing ls made almost as easy as with the usual

pen and holder. Two ink wells are provided at the base of the stand, and the dipping of a pen in one well causes the pen to dip in the opposite well. When the two sheets of paper to be written on are placed parallel to each other and secured, the remainder of the work is as simple as ordinary writing. The instrument is designed to enter an unoccupied field of usefulness, such as providing duplicates of contracts and a variety of legal and other documents which it is often desirable shall not only be duplicated in words, but also in paper and the hand-writing of the author or maker.

The Lantern in Stage Effects.

Some new scientific stage effects were introduced into a recent performance of Wagner's "Die Walkure" at the Grand Opera House, Paris. The scene where the sons of Wotan, mounted on steeds and brandishing their lances, are seen in the clouds is described as very realistic, says the *Scientific American*. The foreground is wild and rocky, and the clouds are seen to scud across the sky. This effect is produced by projecting the image of a cloudy sky by an electric lantern on a curtain of translucent blue cloth. The continuous movement of the clouds for half an hour is produced by painting them on the edge of the disk of glass 12 inches in diameter and rotating the edge past the lens of the lantern. Three lanterns are employed to blend the clouds. The wild cavalcade of Wotan's heroes is produced by a line of mechanical horses, full sized, and carrying real performers. They are supported on a scaffolding, and drawn by means of a cable across the scene at a suitable elevation. The mounted men are strongly illuminated by the electric light, and thus rendered visible through the translucent curtain representing the heavens. The scene terminates by a conflagration, in which great flames run along the rocks, while thick fumes, reddened by Bengal fire, spread through the atmosphere. The flames are due to fulminating cotton, placed in advance on the rocks, and lit by the machinists. Lycopodium powder is also blown through holes in the stage. Weird cloud effects are produced by steam.

Metric Equivalents.

The metric nomenclature is coming into such common use, especially in scientific articles, that the following formulas will be found valuable:

WEIGHT EQIVALENTS.

To convert grains into grammes, multiply by	0.065
To convert grammes into grains, multiply by	15 5
To convert drachms into grammes multiply by	3.9
To convert ounces (avoir.) into grammes, multiply by	28 4
To convert pounds (avoir.) into grammes, multiply by	453.6

MEASURE EQIVALENTS.

To convert cubic centimeters into grains, multiply by	15 5
To convert cubic centimeters into drachms, multiply by	0.26
To covert cubic centimeters into ounces (avoir.), multiply by	0.036
To convert pints into cubic centimeters, multiply by	473
To convert liters into ounces (avoir.), multiply by	35.3
To convert gallons into liters, multiply by	3.8

—Scientific American.

The Yerkes Telescope.

The steel tube of this telescope, which is to be erected shortly in the Geneva Observatory, Chicago, is said to be 68 feet in length, made of sheets graduated in thickness from five-sixths of an inch at the center to one-eighth of an inch at the ends. The weight of the tube is over six tons, the diameter 38 inches at the eye end, 52 inches at the center and 40 at the o.g. The weight of the object-glass itself is 750 pounds.

To Fireproof Combustibles.

A Russian inventor has brought forward a simple substance for fireproofing combustible materials, and its efficacy, it is reported, has been tested with gratifying results under the auspices of the Moscow Imperial Society of Agriculture. In the public experiment, a shanty was built entirely of straw, and, after being covered with the fireproof substance, was submitted to a hot fire, the straw, under this operation, merely changing from a yellow to a reddish-brown color, without igniting or even cracking. It is stated that the society has decided to introduce this new process throughout the Empire, considering that it must prove of the highest service to the numerous straw-thatched houses in the Russian villages.

THERE was recently described in a foreign journal a new form of apparatus in use at the Royal Research Laboratory, Berlin, for testing the comparative hardness of different materials. The substance to be tested is prepared with a smooth or polished face, and scratched with a diamond. This diamond has a point as nearly as possible conical, with an angle of 90 degrees, and is drawn over the substance to be tested under a constant pressure. The hardness is then estimated by the width of the scratch made, which is made by a micrometer. The following comparative results were obtained, and are expressed in arbitrary units, which are inversely proportional to the measured breadths of the lines: Lead, 168; tin, 234; copper, 398; zinc, 426; nickel, 557; soft steel, 765; glass, 1355; hard steel, 1375.

It has been shown by analysis that a young person weighing 154 pounds is composed of 96 pounds of water, three pounds of white of egg, a little less than one pound of pure glue, 34½ pounds of fat, 8½ pounds of phosphate of lime, one pound of carbonate of lime, three ounces of sugar and starch, seven ounces of flouride of calcium, six ounces of phosphate of magnesia, and a little ordinary table salt.

Metallurgy and Ores.

SELBY
SMELTING AND LEAD CO.
416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY
—AND—
ASSAY OFFICE.
Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.
—MANUFACTURERS OF—
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.
—ALSO MANUFACTURERS OF—
Standard Shot - Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.C.& BATTERSEA

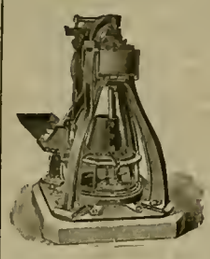
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

THE GRIFFIN MILL.



A perfect pulverizer of all refractory substances by either the wet or dry process. It works better and at less expense than any other Mill, and is conceded to be the only perfect pulverizing Mill Manufactured.

For FREE Illustrated Pamphlet address

BRADLEY FERTILIZER COMPANY,
92 State St., Boston, Mass.

DYNAMITE AND POWDER CO.
—— MANUFACTURERS OF ——
DYNAMITE AND BLASTING POWDERS.
18 CALIFORNIA STREET, SAN FRANCISCO,
Directors:
ROBERT JUDSON, ALVINZA HAYWARD, THOMAS BELL, JOHN S. DOE, ED. O. LUKENS (President.

KEYSTONE
BOILER WORKS
HAMILTON & LEACH,
Main and Folsom Sts.,
SAN FRANCISCO, - CALIFORNIA.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates,
THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 220 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill supplies.

Stamp Cam.

FRANCIS SMITH & CO.,
MANUFACTURER OF
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
NO. 130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

THOMAS PRICE & SON,
ASSAY OFFICE, SAMPLING WORKS,
AND
CHEMICAL LABORATORY,
525 SACRAMENTO STREET, - - SAN FRANCISCO, CAL.

C. W. MOULTHROP,
225 Mission St., San Francisco,
Model Maker, Draughtsman, Blue Prints, Models of Machines, Etc.
MODELS OF MINING PROPERTY.

MINING AND SCIENTIFIC PRESS.
The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St. San Francisco, Cal.

PRACTICAL TREATISE ON HYDRAULIC MINING.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Electricity.

A Mill Where Belts Are Not Used.

A new Belgium factory, we learn from a foreign exchange, uses electricity to transmit its power instead of belting. The dynamo is 500-horse power and forms the flywheel of the compound Corliss engine. The shop is supplied with 16 motors, among them ten 16-horse power, one 21-horse power and one 37-horse power motors. Their average efficiency is 87.2 per cent. On some of these motors the load is very variable, and several are exposed to dust and dirt, so that with 90 per cent efficiency of the dyoamos, 98 per cent of the conductors, 87 per cent of the motors, the net result is 76.6 per cent power delivered. As the lost work in belt-driving is practically a constant quantity for all loads, or at least is usually considered to be, the power required to turn the shafting, pulleys, etc., when no work is being done on the machines, it follows that taking 79.4 per cent as the final output in two cases, one of electrical and the other of mechanical transmission, we find that at a load of 20 per cent the electrical system would still give 47.2 per cent useful effect and the mechaolcal nothing at all. From careful experiments which have been made in actual practice, it has been clearly proven that to drive all the machines idle needs more power than to drlve the shops in ordinary course of work; whereas 11 electrical horse power is required when driving all the tools ldle, only about seven electrical horse power is needed in ordinary work, of which four electrical horse power is used to drlve the shafts, belts, etc., alone; this clearly shows how small a part of the power prodnced by the eogine is actually used in useful work at the tools.

Such satisfactory results of the application of electricity to factory driving must attract attention and will doubtless lead to great changes in transmission. Whether in the case of large machine tools it would not be better to discard shafting and belts altogether, and supply a special motor to each tool, is a question which must be settled for each individual case which may arise; the current could be switched on or off just as easily as the belt is now thrown from the loose to the fast pulley, and vice versa.

Electricity on Steel Cementation.

The influence of electricity on the cementation of steel seems likely to throw light on the physics of the process. M. Jnles Garnier has recently published the results of his first experiments in this direction in which a current of electricity was made to form a circuit, with the carbon packing as anode and the iron to be heated as cathode, says *Engineering*. Both the metal bar and the carbon were inclosed in a tube, which was placed horizontally in a small reverberatory furnace, and heated during the experiment, his idea being that the heat would determine the mobility of the carbon, while the electric current would determine the direction of motion of the carbon atoms. The minimum voltage reqnired to overcome the resistance was employed. The conditions were 7 volts, 35 amperes and 3 hours, at a temperature of from 900° Cent. After the experiment the bar was examined, and the cementation was found to have penetrated to a depth of 10 mllimeters. In a second experiment, two bars of metal formed the electrodes, and were separated by a carbon packiog. In this case, with a current of 55 amperes at 2.5 volts, after three hours' heating the anode bar remained unchanged, while the cathode was hardened to a considerable extent on the side opposed to the anode.

The Storage Battery.

It is more than likely that the storage battery in street aod railway traction, as at present developed, is not immediately practical, except in special or limited conditions, says an exchange. Its more immediate and promising field is in the central-station business. In some parts of Europe this has formulated in a grand success, the result showing an income on the capital invested that has established its economic and commercial value. More than this, and here as elsewhere, the manufacturing interests are insisting on all possible economics to realize even a minimized margin on the profits of production. This demand is incessant and unappeasable, and it needs no prophet to forecast the place electricity will occupy in solving the present problem. There can be no doubt that a vast amount of electrical machinery is allowed to stand idle during the day, when it might be used in storing batteries to run lights at night. This system, as adopted in Paris, works satisfactorily both in a practical and remunerative sense. With proper management in its special fields there can be no reasonable doubt that the storage battery has a future in public and indnstrial service that will be in keeping with its development and efficiency.

New Electric Block Signal.

An electric block signal is in use at the Weehawken tunnel in New Jersey. Incandescent lamps are placed at intervals of about 100 feet and divided into two sections. The heig ht of the lamps is such that they are on a line with the window of the cab of the locomotive. Normally they are lighted, indicating safety and a clear track. When a train enters the tnnnel at the east portal all the light outside the tunnel for a distance of 500 feet and those for 300 feet inside are switched off automatically as well as the alternate lamps for 900 feet farther into the tunnel. The overlap lamps, which alternate with the lamps ln the first section, are left lighted while the trains runs on to a point 2300 feet inside, where the lamps in the second or middle section are put ont, thus producing a dark section of 1100 feet immediately behiod the train, which is maintained until the tunnel is passed. At the same instant that the lamps in the second or middle section are pnt out, those in the first section of 1200 feet are lighted, so that when the train has reached a point 2300 feet in the tunnel the signal to proceed is displayed at the east end for a following train. When the train passes out of the tunnel at the west end the lamps in the middle section are lighted. This is all done automatically by the trains passing over an electrically connected track circuit, all the parts of which are very simple and can be maintained by an ordinary lineman.

Electrical Power for Brick Machines.

In Auburn, Me., Mr. Charles Duon, one of the most progressive brick manufacturers in New England, has arranged an electric motor to do the work of horses in grinding. In all yards where horses are used it is an established fact that one of the greatest troubles experienced in the windlass and treadmill is the rapid declioe of the horses, as the strain upon their shoulders is so great that they succumb in a very short time. Other New England manufacturers are adopting the use of electricity in their plants, and with such excellent results as to premise the opinion that it will soon become universal, so says the *Clay Record*.

More Light from a Dynamo.

A New York inventor, S. L. Trippe, proposes to make a given dynamo perform service, with the same efficiency, for three or four times as many incandescent lights as at present. His theory ls that after a filament is heated to lncandescence the current may be switched off momentarily and be brought back again to keep the gleaming thread from growing dim. He therefore interrupts the electric flow in such a manner as to take three different circuits in turn; and on each of these he undertakes to sustain as many lamps as were originally run on the single circuit. Every one familiar with this style of lamp knows that the fiber contioues to glow for an appreciable length of tlme after the current is turned off. Whether enough electricity will be supplied, however, in the short flashes of supply provided for under this plan to keep the light up to the proper intensity, is something which only experiment can show.

New Fire Alarm.

An apparatus which is susceptible to the expansion of air by heat has been devised in England to act as a fire alarm. The contrivance consists of three essential parts, the air-box, the pulsator and the indicator. When a fire takes place, the air in the box, which is fitted to the ceiling of a room, is expanded, causing the inflation of a thin, hollow india-rubber diaphragm, by which an electric current is produced, which rings an alarm bell and releases a semaphore. After numerous experiments, it is said the instrument has proved to be practical in its application.

New Method of Signaling.

Experiments are being made on the Great Northern railway of England with a method of signaling directly in front of the driver's eye. Contact is made by a brush on the engine rubbing on a rail or wire. If a current is seot from the signal-box to the wire, the circuit is completed with the engine, and the little semaphore on the locomotive drops. Somewhat similar devices were shown at the Crystal Palace Exhihition ten years ago, says the Chicago *Journal of Commerce*, but railroad men do not seem to regard them with much favor.

Disinfection by Electricity.

A new electrical disinfecting system is announced, which consists in passing a current of electricity through sea water, or any solution containing chlorides, and by this means developing hypochlorides, which are powerful disinfecting agents, and can be manufactured cheaply in this way upon a large scale.

Useful Information.

The World's Coal Production.

The *Journal des Mines*, in a receot issue, publishes some particulars of the coal production of the different countries of the world. The coal-mining area of the United States is estimated as follows:

Carboniferous Soil. — Aothracite, 985 square miles; Appalachian, 64,395 square miles; Central, 47,250 square miles; Western, 98,700 square miles; Michigan, 6700 square miles.

Trias and Jurassic. — Richmond-Piedmont, 170 square miles; Deep River, Dan River, 500 square miles.

Cretaceous and Tertiary.—Western Plains, Rocky Mountaios, 20,000 square miles; Mt. Diablo, Cal., Washington, Wyomiog, etc., 11,300 square miles.

New geological workings and new private discoveries have evidently increased this number. The following tables gives the areas of the several mioes in the different conntries:

	Square Miles.	Per Cent.
United States	250,000	58.7
English America	56,000	13.1
Great Britain	12,000	2.8
Spain	4,000	0.9
France	2,000	0.5
Germany	1,800	0.4
Belgium	518	0.1
Other countries	100,000	23.5
Total	426,318	100.0

It thus appears that North America possesses a coal area largely in excess of the rest of the globe. The total production of coal in the year 1891 amounted to 520,000,000 tons. Supposing that 300,000,000 tons were used for domestic purposes, there remain 200,000,000 tons employed for the production of motive power in the different industries of the world.

Mining Royalties in England.

Statistics recently given on the miniog royalties in Great Britain show that the time limit of mining leases varies from 21 to 63 years. A fixed rent is usually payable, merging, however, into the royal rent. Royalties are generally a fixed sum per ton, hut sometimes they vary with the price of coal Where the amount payable for royalty upon coal raised in any year is less than the fixed rent, the difference is known by the term "shorts." Lessees often have the right to work out coal paid for as shorts in subsequent years. Sometimes a lease contains a power to surrender, and as a rnle a lessee ls prohibited assigniog without the permission of the lessor. Special promioence is given to "wayleaves." A wayleave is a leave to pass over or under land not included in the mining lease. For this leave the owner exacts a payment, generally of a penny per ton, but he has the right of refusing any leave whatever.

The estimated total royalty payable in 1889 on coal was just over £4,000,000, and the estimated wayleave charges were over £200,000, makiog a total of £4,200,000. Takiog the total output for the year as 177,000,000 tons, the royalty and wayleave is equivalent to rather more than fivepence per ton. As regards iron ore, the royalty is estimated at £561,000 on 14,500,000 tons, about 9¼d. The estimated royalty for all other metals, *e. g.*, copper, tin, lead, etc., is estimated at £87,068.

How to Grind a Cold Chisel.

Grind the chisel a trifle ronndlng, so as to make the middle cut before the sides and corners, for the middle portion is the strongest and will staod more than the corners, advises the *Horseshoers' Journal*. Have the chisel drawn to a nice taper, not too slim or too chuoky, but about the proportion of one-eighth of an inch thick at the point and three-eighths of an inch thick two inches back from the point, a taper of one-fourth of an inch in two inches, or one-fourth to one and one-half to the foot. For heavy chopping, increase this to two ioches to the foot, but for ordinary work the taper given is about right. Begin about a quarter of an inch back from the point and grind for your cuttiog edge, keeping the bevel about equal on each side of the center and bring it down almost to an edge, then make the real edge by grioding to a little more abrubt taper. This will be found to make a very strong cutting edge and one that will last looger than when the cutting edge is ground on a long bevel. We want all the metal possible right at the edge, that we can get without making the cutting edge too thick and clumsy, and the writer's experience with cold chisels has seemed to show this form well adapted for general work.

To Estimate Brick Work.

Ordinary bricks are about eight inches in length, and, with a mortar joint, ahout half that in width, so that each brick on the flat will give a horizontal surface of about 32 square inches, or 4½ bricks will cover one square foot, says an exchange. As ordinarily laid, there are nine courses to every 24 inches, or 4½ to the foot; 4½ courses, with 4½ bricks to the conrse, will give 20¼ bricks to the cubic foot. Waste, cntting and close joints will easily require an allowance of 21 bricks per cubic foot, which will be found a very coovenient figure for estimating the number of bricks required for a wall of given height and thickness, as it thus becomes uonecessary to find the cubic contents of the wall, but merely to multiply its face area, or the product of its length and

height in feet by seven-fonrths of its thickness in inches, whicb, as the thickness is always some multiple of four inches, is a very simple process.

Useful Hints.

To make a glue that will stick, take a quart of water, add two pounds of best glue and dissolve by heat; allow this to cool, when add gradually seven onnces of nitric acid; when coid, put into bottles. It will not harden, but form a strong cement.

To renovate velvet, free it from dust by laying face down and whipping smartly; then brush with a soft hair-brush; dampen on the wrong side with borax water, and hang pile inward in the sunshine to dry, taking care that there is no fold or wrinkle on the line.

This is the proper way to peel tomatoes: Cover them with boiling water half a minute, then lay them in coid water until they are perfectly cold, when the skin can be slipped off without difficulty, leaving the tomatoes unbroken and as firm as before they were scalded.

To remove paint from window glass, take a sharp putty knife that has a perfectly even nnnicked edge, and scrape off as much as you can without danger of scratching the glass. Then mix a little oil and turpentine with fine pumice-stone and carefully rub off the remainder. Clean with soap and wash and polish in the usual way.

It is frequently asked how much mustard should be given if it is desired to make a patient sick in case of croup or poisoning. A tablespoonful of ground mustard to a tumblerful of warm water is the rule. Salt is almost as efficacious as mustard if the latter is not at hand. If the first tumbler has no effect, give more and tickle the back of the throat with a feather.

Coal Mines and Health.

If one may judge from the physique of the underground toilers of the Black Conntry, they present an appearance more provocative of envy tban of pity, says London *Hospital*. Disease is no more demolishing in its raids among them as a class than it is among the agriculturists and laborers. If one can be guided by statistics, the coal-dust atmosphere in which their life is passed is no element of any serious evil to them. It may not be pleasant, but it is not unhealthy; indeed, the actual death rate of those miners is not abnormally high, even when it includes the fatal wholesale disasters whicb occur from time to time in the pits. However much reason tbe promoters of the pending coal strikes may have to substantiate their tbeories, the evil of any extreme insanitary condition of the workers themselves below ground cannot in any fairness be included.

Experiment with a Cedar Shingle.

A correspondent of an English lumber paper gives the following information on an experiment made with a cedar shingle. A green shingle, fresh from the saw, was measured and weighed, care being taken to get both exact. It was found that it weighed seven ounces. It was then dried and again weighed and measured. It had shrunk nearly one-eighth inch, while the weight had decreased from seven to three ounces. It was tben submerged in water 24 hours, and the size had not changed a particle, while the weight had increased about one ounce. He claims that this demonstrates the superiority of cedar shingles over others, as, when once dry, they will neither shrink with excessive beat nor pry one another off the roof in wet weather.

Cultivate a Memory for Names.

"As good a piece of advice as I could give a young man starting into business," said an old, successful merchant, "would be to get his customer's name right. Of course, everyhody means to do this, hut I don't thlnk everybody attaches to lt its full importance. The fact is that almost every man is proud of his name, whatever it may he, and he dislikes to see it misspelled or incorrectly wrltten. There are plenty of names which sound alike but which vary in the speliing, perhaps only a single letter; and, too, ln taking a man's name, it ls not so difficult as one might imagine to make a mistake in the initials, for there are letters which sonnd very much alike. When you get a new customer, get his name right to start with. No man likes to receive a package or a hill or a communication of any sort with his name misspelled; however modest and good natnred he may be, he is pretty sure to he annoyed hy it.

Gold and Silver in the Arts.

More silver and gold are used in the industrial arts in the United States than in any other country. Our annual consumption of gold for this purpose amounts to over $16,000,000, and of silver to over $7,000,000. Germany is the next greatest consumer of the precious metals for manufacturing pnrposes, and each year works up about $12,000,000 worth of gold and about $6,000,000 worth of silver. France uses about $8,000,000 worth of gold and $4,000,000 worth of silver.

Lemon Syrup.

Take one pint and a quart of juice, two pounds of sugar. Let the juice stand in a cool place to settle. When a thin film is formed on the top filter the juice, add the sugar, and finish in the bain-marie. If the flavor of the peel is desired with it, grate off the yellow rind of the lemons and mix with the juice to infnse, or rub it off on part of the sugar and add it to the remainder when you finish it. Orange syrup is made in precisely the same manner as lemon syrup.

World's Fair Distances.

To see the World's Fair and walk through the buildings the grand total is something in excess of 118,000 feet, or nearly 23 mlles. This estimate does not include State, Government or private buildings; the plaisance is ignored and no account ls taken of tbe long jumps from one building to another. A walk of about 40 miles is necessary to do the whole thing up.

A New Rain-Maker.

Rain-makers have a rival in J. M. Matthews, of San Antonio, Texas, who is working on a new rain-making process. He is building a buge revolving wbeel, witb which to produce a cyclonic pressure of hot air upon the cold stratum of air above the earth, and thus condense the moisture in the hot air into raindrops.

Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, duly appointed under the act of Congress of March 1, 1893, having received a petition from B. Below and others for permission to mine by the hydraulic process in the Polaris, Etna and Austral mines, situated in the Goodwin Township, In Plumas county, California, and to deposit tailings behind a dam to be built in Hopkins' creek, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92 Flood Building, San Francisco, on October 10, 1893, at 1:30 P. M. On and before this hour and date, all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission. W. H. Heuer, Major, Corps of Engineers, Secretary.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from A. Steinberger for permission to mine by the hydraulic process in the Brandy City District, situate at Braudy City, Sierra County, California, and to deposit tailings in an old hydraulic pit, gives notice to all concerned that a hearing will be held at the office of the Commission, room 92, Flood Building, San Francisco, on October 10, 1893, at 1:30 o'clock P. M. On and before this hour and date, all parties interested may file affidavits, plans and maps in support of their respective claims.—By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

POSITIVE SAFETIES. Improved Ram Elevators, Sidewalk and Hand Hoists. B. E. Henrickson's Patent Automatic Safety Catches.
Machines of all kinds Made and Repaired. Orders Solicited.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.

Table of Contents:

Preface; Introdnction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth, 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III,

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION — JUST OUT.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco, Cal.

The Explorers' and Assayers Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

INVENTORS, TAKE NOTICE!
L. PETERSON, MODEL MAKER,
226 Market St., N. E. cor. Front (up stairs) San Francisco,
Experimental machinery and all kinds of models. Tin, and brasswork. All communications STRICTLY CONFIDENTIAL.

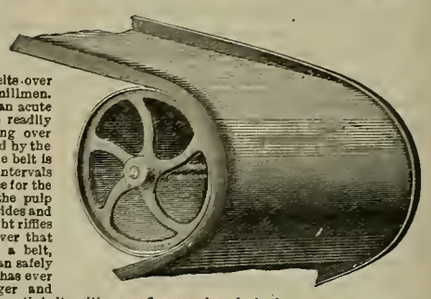
THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

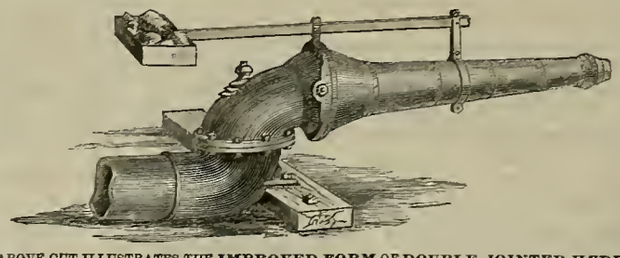
NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

—BUILT SOLELY BY THE —

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
SOUTH MILWAUKEE, WIS. U. S. A.

IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

Coast Industrial Notes.

—Tbere are nearly 300 shingle mills in Wasbington, and perhaps twice as many men wbo are owners of them.

—Tbe statement is made that the Port Blakely Mill Company logs over 2000 acres of timber land annoally to secure material to operate its saw mill at Port Blakely, Wasblngton.

—Tbe employes ln the railroad shops at Sacramento and Oakland have hegun to work six days and nine bours. They have heen woiking eight hours and four days a week for several weeks past.

—There is a rumor at Victoria, B. C., founded upon private advices, that the Governments of the Unlted States and Great Britain are negotiating to close Behring sea and the Pacific for two years.

—It is reported at Chino tbat Claus Spreckels bas hought 6000 acres of the Bixby rancb, near Westminster, Orange county, and will plant it to heets. If tbis he true, it means another sugar factory for that region.

—The directors of the Alameda, Oakland and Piedmont Electric Railway Co. have filed a certificate of the action of the stockholders at a meeting held December 15, 1892, creating a honded indehtedness of $350,000.

—Yolo county's tax rate is $1.20. It was $1.10 last year. The rate ln Napa is $1.65, 35 cents higber than in 1892. Amador's rate is the beaviest ln years, $2; San Joaquin's, $1.30; San Bernardino's. $1.83: Marln's, $1.30; and Sacramento's, $1.40.

—Work on the huildings and grounds of tbe proposed Midwinter fair at Golden Gate park has heen hegun in earnest. The transcontinental roads have agreed to a round-trip rate of $65.50 from Missouri river points to San Francisco during the Midwinter fair.

—The insnrance companies have adjusted the loss by reason of the fire at the Pacific Iron and Nail Works. The nail company fixed its loss at $80,000. A settlement was made on a hasis of $65,000. The company bas announced its intention to rehuild the works.

—All the transcontlnental lines except the Sonthern Pacific were represented at a meeting in Cbicago, Tuesday, to consider rates to California's Midwinter Fair. It was practically decided, if tbe Southern Pacific agrees, to make the ronnd trip $65, the same as now.

—In Sonoma county there will he 10,000 or 11,000 hales of hops produced this year, against 8400 last year. Tbe bops are of an excellent quality. Only white lahorers were employed and tbey were so satisfactory that Chinese will not he glven work when wbite belp can he secured.

—It has been found that the law authorlzing the issuance of $600,000 honds for the construction of a ferry depot in San Francisco is defective, hut tbe Board of Harhor Commissioners will endeavor to go ahead with tbe putting up of the union depot with the funds at its command.

—Work on the Yuha cut-off is progressing satisfactorily. Nearly 200 men are employed and over 400 horses. Buck scrapers, wheel scrapers and sllp scrapers are used, and 6000 yards of dirt are heing moved daily. Wben a deptb at which seepage water interferes is reached, steam sbovels or dredgers will have to he used.

—The Southern Paclfic Company, it is said, has concluded to raise its rates on freigbt transported between San Francisco and points across the hay hy the several express companies, the increase, so tbe story goes, heing equivalent to 25 per cent over present charges. It is also rumored tbat the creek route proposes to raise the ferriage on teams from 25 cents to 50 cents.

—The Oakland Council Water-front committee has closed negotiations with the Davie Ferry Co. and the slip and wharf for the opposition ferryboats will now probably he pushed before the winter sets in. There was some hesitation about going ahead with the work hefore the ferry company signed a contract to use it for a stipulated time at a certaln figure, hut Mr. Davie has slgned for 12 months.

—Articles of lncorporation have been filed at Los Angeles by Captain John Cross and ex-Senator Cbarles W. Cross of San Francisco, and others of Los Angeles and Pacific Railroad. Tbe capital stock will be $200,000. This is intended to be a revival of the old foothill railroad to Santa Monica, which for several years has been idle. The new company will use steam locomotives for a time, witb tbe ultimate design of operating the llne hy electricity.

—A big cigar-shaped pile raft has been made at Coos hay to he towed to San Francisco. Tbe raft is 612 feet long and contalns 3500 piles of an average length of 70 feet, and draws 16 feet of water. Considerable interest is taken in the raft, and its successful trip to San Francisco means the opening of a new enterprise on Coos hay. Captain Roberts of tbe National City has taken the contract to tow it to San Francisco and wlll take it on hls next trip, which will he some time soon.

—A lumber war is on in San Francisco. Tbe Pacific Pine Lumher Co. offers to furnish the Board of Harhor Commissioners witb Oregon pine lumher No. 1, in sizes and lengths as ordered, for $10 per tbousand, delivered, and cut the price on piles to 11 cents per foot for 12-inch piles, 12 cents per foot for 13-inch piles and 13 cents for 14-inch piles, delivered. Tbese prices the Slade Lumber Co. met, and now comes the Golden Gate Lumher Co. and offers the same lumher at $8, delivered, piles at 10 cents, 11 cents and 12 cents delivered.

—Representative Hllborn has presented to Congress a memorial asking for the opening of the western end of the tidal canal, in Oakland harbor, through the isthmus into tbe estuary of San Antonio creek, to a wldtb of 400 feet and a depth of eigbt feet helow low tlde, so that the full ebh and flow of tides may pass to and fro hetween the estuary and the extreme eastern limit of the tidal canal hasin as now constructed, to the end tbat the nuisance whicb now exists by reason of the impounding of a large hody of contamlnated and impure water, wbicb is a menace to the health of 75,000 people in said cities, may be abolished, and asking that an appropriation of $50,000 be made available at once to make tbe improvement.

—The preliminary arrangements for the consolidation of a numher of the street-car lines of this clty into one gigantic company have heen practically completed, and all that now remains to be done is to make the formal transfers of the property and perfect the details for the operation of the new corporation. The new organization will include about all the roads in the city, with the exception of the Geary and Callfornia-street lines, the Presidio and Ferries and the two electric roads. The plan for the allotment of stock in the new company will he formulated hy a company appointed for that purpose. It will he hased upon an estimate of tbe earnings of tbe varlous lines for several years hack, tbeir present boldings in rolling stock, roadhed, machinery, etc., and all other matters that would naturally enter into an estimate of the relative wortb of the corporations.

—Tbe Sacramento Electric Power and Light Co. has closed a contract with tbe General Electric Co. for furnishing material and erecting a plant for the transmission of power from their works at Folsom to Sacramento, 19 miles. It will take, however, 324 miles of copper wire of 500,000 pounds in weight. Provislon is made for cutout stations at convenient points, so that the lines may he divided into tbree sections and grounded or cross-connected, so tbat notbing short of a total prostration of tbe plant will interrupt operations. Work is to he completed wlthin 10 months. It is also provided that tbe company shall forfelt $50 per day for each day the work is incomplete. This is one of tbe most important enterprises ever brought to a head in the interior of the State. It means tbe transmission of almost nntold motive power from the great water system of Folsom to Sacramento for operating street cars, city lighting, power for factories, etc.

—Sealed proposals will he received hy tbe Board of Trustees of tbe State Normal School at Los Angeles, Cal., until 10 o'clock A. M. of Saturday, October 14, 1893, for furnishing tbe materials for and doing the work of erecting a new building for the State Normal School at Los Angeles. Bids will also be received as required hy law as follows: For tbe furnishing of the materlal for and doing the iron and mason work; for the furnishing of tbe materials for and doing tbe carpenter's and plasterer's work; for tbe furnlshing of the materials for and doing the plumbing, gas-fittlng and beating work; for tbe furnisbing of the materials for and doing tinning, galvanized iron and slating work; for tbe furnisbing of the materials for and doing the painting and graining work, and for tbe furnishing of tbe materials for and doing tbe electric work, will he separately received, and separate contracts for furnishing sucb materials and doing such works will he received and made as set out in this notice.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Kern.

THE BIG BLUE.—Kern coonty *Echo*: H. P. Bender has just completed an abstract of the title of the Sumner Gold and Silver Mining Company's property at Kernville. This is the property commonly known as the "Big Blue," and includes an 80-etamp mill and a mine of admitted richness. The abstract referred to covered aboot 750 closely typewritten pages and was prepared for tbe Kern County Land Company, otherwise J. B. Haggin and Lloyd Tevis. As Haggin, Mackay and Jones have been making some large mine porchases of late, and as there is a general belief that we are on the eve of a great revival of mining business on tbis coast, the facts above stated may be of eome interest in tbis county.

Lassen.

FIRST ORE SHIPMENT. — A dispatch from Amadee, Sept. 19th, says: The firet carload of ore shipped from the Cottonwood mines, in Nevada, was hanled a distance of over 100 miles by team and shipped to tbe Reno Reduction Works to-day. Several years bave been spent in prospecting these mines, and many excitements have been the result. Neither fuel nor water is available, and all the ore will be hauled across the Smoke Creek desert and sbipped by rail from Amadee. The ore is principally silver.

Mariposa.

TO BUY THE HITE.—Mariposa *Gazette*, Sept. 23: Mr. James McCaw passed throogh here last Saturday on hie way down from the mountains. Mr. McCaw has been negotiating for the Hite mine, and bad been up to make final terms with Mr. Hite. Sbould the eale be confirmed, be bas a large amonnt of machinery ready to be ebipped to the Cove, and he will at once pnt men to work on the roads, getting things in shape for a long run of work.

Mono.

MINE TO BE BOUGHT.—Bodie *Miner*, Sept. 15: The Ward mine, at Green Creek, is to be purchased by Archie Farrington for the eum of $16,000. Farrington visited the mine a short time ago, and it is known tbat he was favorably impressed with it. The recent milling of ore gave more than satisfactory results, and the bullion went $16.60 to the ounce. Tbere is no donbt but that tbe Ward mine is a valuable property, and if a etrong company should take hold of it and successfully work it, a great stimulus would be given to mining in tbat vicinity.

Nevada.

MINE LEASED.—Nevada *Transcript*: Richard Thomas has leased the old Bed Rock mine at Birchville and will proceed to work it by tbe drifting process. It is a good mine, and Mr. Thomas will soon give employment to a considerable number of idle men in that vicinity.

THE PROVIDENCE.—The *Transcript* eays it is rnmored upon what eeems to be good authority that negotiations have been going on for some time for tbe sale of the Providence mine to a big syndicate of San Francisco capitalists. Ex-Senator James G. Fair, Col. A. E. Davis, who some time ago sold the Santa Cruz narrow-gauge railroad to the Southern Pacific for $6,000,000, Col. Patrick Reddy, the well-known lawyer, and one or two other prominent meu are expected to arrive in Nevada City in a day or two for the purpose of examining the property, which is considered very valuable.

A GOON CLEANUP.—Nevada *Telegraph*: The rock bauled from the Black Bear ledge, near Rough and Ready, recently croshed at the Pennsylvania mill, yielded $4 50 per ton. The yield is considered very good hy the owners, as the ledge is of immense size. Further developmente will be made on the property.

Placer.

GOON ROCK FOUND.—Placer *Herald*: T. M. Tharp, one of the owners in the Moore quartz claim located a mile or two helow Auburn, was in town last Saturday afternoon and informed ns that their ledge, which yielded aboot $40,000 from a ehaft on it 300 feet deep, continues to show new merit with each additional development. At a depth of 100 feet they run a level in 80 feet and fonnd rich rock all tbe way. They are now running in on tbe 180-foot level and the ore is even richer than it was near the surface. All the rock is of a high grade for milling and in many places it is rich enough for specimens. On the afternoon of Saturday they uncovered a fabulously rich body of ore and took out before dinner that day at least $1000.

Plumas.

RICH STRIKE.—Truckee *Republican*: Another rich strike has been made in the Plumas-Eureka mine as Johnsville, Plumas county. This is one of the oldest mines in the State, being owned by the same company as the famous Sierra Buttes mine of Sierra City. The Plnmas-Eureka had not been paying well lately and the company intended to close down shortly for the winter. Now that another rich ledge hae been found work will probably be continned there just the same as before.

Shasta.

THE GLADSTONE.—Nevada *Telegraph*: The Gladstone mine, situated at French Gulch, in Shasta connty, has been in operation for some time. Several days ago about 60 men were let out from employment at the mine. This was done for the reason that the mine is not sufficiently opened to admit of the employment of a large force of men. It is thonght that in a few months all the men will be put to work again. The Gladstone property is owned hy the Standard Oil Company and is a very valuable piece of miuing gronnd.

GOON STRIKE. — *Courier*, Sept. 23: Whit George and John Bauder have "struck it" in dead earnest at Mnletown. They are on a seam whicb is growing bigger and promises to develop into something great.

Kirk Soalding has bonded his mine at Nigger Hill, about two miles from Shasta, to parties below. Two sbifts were set to work on the mine Friday, and it is expected that quite a force may he employed there. Hont, tbe man who negotiated the deal, went to Siskiyon county to tear down a four-stamp mill near Yreka, which will be pnt np at the miue.

Messrs. Grayson and Ewen of San Francisco are negotiating for the purchase of the Hall, Murray & Conroy mine, and several other mining men are expected np to look at mines in this vicinity.

The ten-stamp mill at the Hidden Treasure is rnnning steadily on good ore. They made a $600 clean-op the other day from a rnn of about 20 tons.

Stingy Jim informe us that the new mill is np ready for inspection. He pnt in the concentrator last week.

Conaut's five-stamp mill is crnshing ore from the old Wbeeler mine, near Whiskytown. They are taking out some very good ore. Oliver Woodward is in charge of the mill.

Siskiyou.

LUCK FOR CHINESE.—Yreka *Journal*, Sept. 20: The Chinese Company, working the Klamath river claim, adjoining the old Fort Jones claim, has been taking out exceedingly rich pay gravel this season, and will continue to take ont a great amount of gold dust nntil the winter storms compel suspension of operations. The men employed now resort to drifting as more advantageous than open cuts, as tbe bedrock or channel bottom is 60 feet below the surface of the river.

Other claims on the river have been paying very well, and would yield a still greater amount of gold but for the scarcity of help. The companies do not seem anxious to hire any persons they do not know, hence have been working ebort-handed all season, thongh employing all the white men, Chinese and half-breeds who reside in the county.

A new ten-stamp mill has just been set np at tbe Sterling mine on Sonth Fork of Hnngry creek, in the Siskiyon mountain foothills, which will be started np on 25th in crushing a lot of quartz taken out, and also a lot from J. C. Coyle's ledge adjoining.

The Greenborn blue gravel mine, a short distance south of Yreka, has been paying very well lately, with only two pickmen at work in the drift, on account of water being scarce for washing. Tbe first two riffles of eloices are cleaned up every day, and all the sluices at end of week, realizing from two to three onnces each day, and considerable more on the seventh day, the cleannp on last Sunday amounting to 7 onnces and $5. Tbere is very little water in the creek at present, the most of the supply coming from the drainage pump, wbich is saved in a large tank. As soon as the winter rains commence to furnish a better supply of water, a large force can he put at work with good enccess, as there is plenty of rich blue gravel to he taken out. Tbe company has contracted for delivery of 400 cords of wood to keep the machinery in constant operation, and expect to take out a large amount of gold during the coming winter and spring.

The Siskiyou Quicksilver Mining Co. has let contracts to run two tnnnels in their claim on the west branch of Beaver creek for finishing up assessment work, with the intention of commencing operations next spring on an extensive scale. Mr. Newcomb, one of the stockholders, has been at the mine and expects to take charge of the work next year, believing that it is a valnable location of superior cinnabar.

ON BEAVER CREEK.—A letter from Siskiyon county gives the followiug items from the mines on Beaver creek: The Patterson mine will not be started again till next season. W. T. Beagle and his son will work at the Beagle and Brunk claims all winter. W. F. Torrey and two sons are working at hie claim on Grouse creek. Wm. Hurst is prospecting a claim on Grouse creek above Torrey's. Tom Henry will work at his claim on Beaver below Henry's. Willey, who is operating a mine with giant and derrick, five miles helow the Patterson mine, has struck a richstreak, and is taking out good pay.

THE GREENHORN.—Yreka *Journal*, Sept. 27: Tbe Greenhorn blue gravel mine, about a mile south of Yreka, still continues to pay handsomely, notwithstanding the lack of water preventing the working of more than two pickmen. The cleanup last Sunday for the previous day's operations amounted to nine ounces lacking half a dollar. When the rainy season commences to furnish more water for working an additional force the amount of gold realized will be largely increased.

A man named Barnes is now crushing qnartz from his ledge on Cherry creek, at the Greenhorn and Deadwood divide, which is paying exceedingly well. He feels certain of realizing at least $3000 for his work this season.

James E. Irousides was in town last week with a large supply of bullion from his qnartz ledge on Cherry creek, which has been paying very well this eeason.

Jordan & Bro., of Humbug creek, are still husily engaged in opening their ledge lately discovered, which, thoogh only four or five inches wide, mills at least $50 or $60 to the ton, with hope of widening as the work of sinking down progresses.

A man named Rose, who has been working a fine ledge of quartz on Eddy'e gulch, in Salmon River section, has just erected a 26-stamp mill at the mine, for the purpose of crushing the ore on an extensive scale.

Judge Holcomb, of Oregon, has bonded a

quartz mine at Salmon river, near Sawyer's Bar, belonging to Dr. A. C. Helm and others, and intends placing a nnmber of men at work on same under the management of Frank Holberg.

Qnartz taken out on Greenhorn creek by the late D. McPherson, is now being hanled to the McCook mill on Hnmbng by Myron Carrick, at the request of the administrator, which it is thonght will pay well.

Browu & McDonald, who have been working a ledge on Humbng creek, had 16 tons of rock crushed lately at the McCook mill, which paid $17 to the ton.

Charley Abbott, of Greenhorn, hauled 7½ tons of qnartz from his ledge on Greenhorn creek to Hnmbng, which was crnshed in the McCook mill, realizing a handsome retnrn.

Sierra.

Corr. Downieville *Messenger*: The Nevada Drift Mining Company are building a new office and storehouse on their claim at Newark. A large supply of timbers has been laid in for drifting purposes, and the gronnd, like all on this ridge, prospects well; average, $2 to $5 a carload—23 cnbic feet of gravel. A quartz specimen weighing five pounds, recently fonnd in this mine, yielded $964.

The Niagara Consolidated drift and hydraulic mine at Hepsidam, three miles northeast of Gibsonville, owned by the late Miles Schofield, is being operated by his sons, Alfred and Miles. Good paying gravel has for years been run throngh by two main tunnels, in 4000 feet. The location compriscs 1300 acres of mining gronnd, a mile of tailing claims and 1000 inches of water, available for drifting or to hydranlic. The Shofield boys lately, in three honrs, with a rocker, washed out $9 from snrface gravel in a ravine on their claim. The property is being fitted np for thorongh development this coming winter.

H. Tahor's tnnnel is in 2400 feet, face in hard rock. He is working five men, and indications are that gravel is within 100 feet. This lead is a part of the Thistle Shaft and Feather Fork Company's Gibsonville and La Porte channel. Mr. Tabor has expended a small fortnne in the development of this valnable mining property.

Trinity.

Temporarily Shut Down.—*Journal*, Sept. 23: The Altoona quicksilver mine was closed down last week and a large nnmber of men turned off. This, it is learned, is only temporary. The reason, the parties were informed, was on acconnt of the fornace leaking, which cansed the loss of a large amount of quickeilver. The fnrnace will be torn down and another rebuilt, when the work will again be resnmed with the same large force.

Tuolumne.

Rich Find.—Tnolnmne *Independent:* David Williams has discovered a rich quartz mine above Italian Camp, on the Stanislaus river, directly opposite the Keltz mill. W. D. Bannister and A. C. Nelson are interested in the property. The latter gentleman bronght some of the rock down this week. The rock obtained from the ont-croppings is very rich. The vein ie apparent for a distance of 200 feet down the hill, and ie nniform in richness and abont one foot in thickness.

Ventura.

A Mica Mine.—Bakersfield *Californian*: J. A. Robb & Co. have opened a deposit of mica in the Pirn district which promises to be very valnable. Mr. Robb discovered the ledge last April and began work on it in June. The surface croppings were only abont an inch wide, bnt at a depth of 8 or 10 feet the ledge has widened ont so that sheets eight inches square are taken ont, and the ledge is still widening. The quality of the mica improves, too, with depth. The ledge has been nncovered for 50 feet, and Mr. Robb believes he has a bonanza, and indeed he has if it holds out. He has offers of $4 to $7 a ponnd for all the clear mica that will average four to eight in width, and apparently there is a large snpply that will come to these reqnirements.

NEVADA.

Washoe District.

On the Comstock.—In Con. Cal. & Virginia 40 tone of ore, assaying $22 per ton, were extracted dnring the week ending Sept. 16th on the 1500 level in following narrow streaks. The crosscnt running west from end of drift from end of an east crosscnt from main sonth drift, 1600 level, continues in porphyry showing streaks of qnartz of low assay value. An east crosscnt has hean advanced on same level from north drift in porphyry, clay and qnartz. Have continued necessary repairs to the drifts on sill floor of 1650 level, and from end of sonth drift from winze, 52 feet down, have extracted 421 carloads of ore—abont 416 tons. Have shipped to Morgan mill during the week 345 240-2000 tons of ore, the average assay value of which (per sample cars) was $27.42 per ton. The average assay value (per battery samples of all the ores worked at the mill during the week, 390 tons) was $24.88 per ton. Bullion now on hand in our assay office, assay valne about $13,000.

On the 1565 level of Mexican the south drift continues in soft porphyry and clay formation which carries little quartz. The east crosscnt on same level of Ophir is in a soft porphyry formation carrying a little clay. The sonth lateral drift from intermediate tunnel in Sierra Nevada has been advanced 20 feet; the face is in porphyry and bunches of quartz. West crosscnt No. 5, on 200 level of Gould & Cnrry, has been extended 17 feet throngh hard porphyry. The east crosscut on 240 level of Andes is in quartz and clay. West crosscnt No. 3, on 200 level of Best & Belcher, is passing through soft porphyry, clay and quartz.

The west crosscut from the sonth drift, 220 feet south of the shaft, 850 level of Potosi, is ont 49 feet; face in porphyry. The sonth drift on the sixteenth floor above the 930 level was advanced 19 feet during the week; total length, 55 feet; face in porphyry and streaks of quartz that gives fair assays. Extracted and sent to the mill the past week 347 750-2000 tons of ore from the 1000 and 1100 levels. Milled dnring the week 348 tons; on hand at mill 92 200-2000 tons. Average battery assays, $19.91; average car-sample assays $22.07.

Have completed repairs to the west drift, 250 level of Chollar, and are now making some repairs to the west drift on the 100 level and the main incline below the 930 level. The west crosscnt from the north drift, 930 level, is ont 62 feet; face in porphyry. The new winze below 1300 level of Hale & Norcross is down 23 feet, and continues in good ore. Are now working east in ore from bottom of winze four sqnare sets. Have extracted from the winze the past week 41 cars of ore; average assay valne per car sample, $35.30 per ton.

Summary of Comstock Operations.—Last week was a favorable one at the Con. California and Virginia mine. The shipments of ore to the Morgan mill amonnted to 513 tons, and were the largest in many weeks. The average car-sample assay of this ore was $32.90 per ton. The amount of ore milled was 429 tons, and the average battery-sample assay was $28.66 per ton. Dnring the week bullion valned at $13,-354.41 was shipped to the Carson Mint. Of the ore yield of the past week 44 tons was extracted from the openings 75 feet above the sill floor of the 1500-foot level, and the averge of the same was $30 per ton—the highest yet. Good ore continues to be fonnd in the various openings 52 feet below the 1650 level. In the Ophir mine they have snspended work in the east crosscnt from the main south drift on the 1565 level, and are removing the air-pipe, car track, etc., from that point. Repairs to the Ophir main shaft, jointly with the Mexican Company, continne to be made. On the 1565 level of the Mexican mine the south drift from the east crosscnt from the main north drift continnes to follow a qnartz prospect which yields low assaye. On the 900 level of the Union shaft the joint north drift from the Union Con. and Sierra Nevada west drift started at a point 1520 feet west of the shaft, is in 156 feet, and the face is in porphyry, clay and qnartz giving low assays. No changes in the condition of the Andes, Best & Belcher or Gonld & Cnrry minee are reported.

In the Chollar mine they have started a drift on the 100-foot level at a point 145 feet north of the Potosi line to explore the npper ground. In the Potosi mine they have started an npraise from the south drift on the sixteenth floor above the 930 level and advanced 16 feet; top in porphyry and bnnches of quartz that give fair assays. The north drift 28 feet below the 1000 level is ont 33 feet; face in porphyry and low-grade qnartz. Extracted and sent to the mill the past week 206 tons and 1000 ponnds of ore from the 1000 and 1100 levels. Milled dnring the week 151 tons. On hand at mill, 147 tons and 1200 pounds. Average battery assays, $20.73; average car-sample assays, $35.32.

In the Hale & Norcross mine on the 1300 level they have finished pntting the sqnare sets of timbers in the new winze and drifted east from bottom of winze seven feet. The bottom of winze shows a width of about eleven feet of ore, and the face of the east drift shows a mixture of ore and porphyry. Have extracted from the winze the past week 17 cars of ore, average assay valne per car samples $30.50 per ton. At the Ward shaft, the west drift on the 820 level is in 168 feet, the face being in hard porphyry. At the Occidental Con. they continue to extract from the west ledge, above the 400 level, from two to three tons of ore per day of the average value, as per car samples, of $39.40 per ton. The west crosscnt from No. 2 npraise, started at a point 75 feet below the 200 level, is in 24 feet; face of porphyry with streaks of qnartz. In the Kentuck Con. mine from the south lateral drift in the east ledge they have started a west crosscnt which is now in ten feet; face in porphyry and quartz. In the west ledge they have raised two sets of timbers for chnte way.

Kennedy District.

Kennedy District Mill. — Reese River *Reveille*, Sept. 20: W. T. Jenkins has the Rock creek quartz mill torn down and enroute to Kennedy district, where he will erect and operate it on Kennedy ore.

Mrs. L. D. Huntsman owns a very promieing mine in Kennedy. Mark Wiggin and Ed Stone also have good claims there.

ARIZONA.

More Stamp-Mills.—Phœnix *Herald*: The starting of the Morgan City stamp-mill is an indication of prosperity in this section of Arizona. The Harcuvar Company has been spending from $3000 to $4000 a month in this town. There will be another stamp-mill in operatiou in the early part of November, this one in the Cave Creek district by the Phœnix Mining Co.; that company has been distributing $10,000 or $12,000 a month. The Mammoth mill at Snperstition will be in operation thie week. While the distribution of money from that enterprise does not at all reach Phœnix, it stays in Maricopa conuty, and the neighbor sisters, Tempe and Mesa, are the gainers.

Mining Notes.—Kingman *Miner*, Sept. 23: O'Dea & Co. have some splendid ore on the dnmp of their shaft on the Prosperity mine.

The Senator company is sinking for water on the river bank near their gold mine. It is now thought that an abundance of water will be secured by the middle of next week.

T. B. Lyons had four tons of ore from the Prince Albert mine, White Hills, worked at the Kingman sampler this week. The ore was as rich as any prodnced by that property in many months.

The sampler is now buying ore and paying cash in fnll. This is a great convenience to shippers as compared with the rates offered by most of the Eastern smelters, who only pay part cash and the balance in 30 to 45 days, or else limit the amonnt of silver that the ore mnst contain to be accepted by them.

Charles E. Sherman has jnst had several tons of ore from the Distaff mine at Chloride, worked at the sampler. The ore is rich in silver and will net a large sum of money. Mr. Sherman will eoon resume work on his property, as it is too valnable to remain idle for any length of time.

U. S. Jackson, Mix Bros. and Dick Cleve have their tunnel on the Grey Eagle mine, Wallapai monntains, in 180 feet. They are having ore packed down to the road and will have it hanled to the sampler in a few days.

Ike Conkey came in from the Lady Bug mine, near Mineral Park, yesterday evening. He saye that the main shaft of the mine has caved from top to bottom, completely shutting off fnrther exploitation in that part of the mine.

Walter Scott is working on his gold claims, of which he has qnite a nnmber in the Chimeheueva mountains. The ledges are large and contain paying qnantities of copper and gold. Mr. Scott has spent a great deal of money and mnch work to put his mines in condition for the extraction of ore and to show to parties who may desire to invest in this kind of property.

An assessment of 50 cents a share has been levied on the stock of the Arnold mining company. There are 100,000 shares of stock in the company and if the assessment is fnlly paid up $50,000 will be turned into the company's treasnry with which to pay off the several judgments against the concern, and also to commence operations on their valuable property in Cedar valley.

John Jamison, James Dnndon and Ike Hnnt have commenced work on the gold claim in Layne Springs and will soon have a carload of ore ready for the sampler. They have 15 inches of five-onnce gold ore to commence work on and already have five tons on the dnmp. This is one of the best little mines in the conuty, having yielded more good ore for the amonnt of work done than any other property in Arizona.

Robert Clark, one of the old-time miners of this county, and James Daily, have jnst had worked at the sampler four tons of Ivanpah ore. The ore netted between one and two thonsand dollars.

A Nugget Worth Having.—Cor. San Francisco *Bulletin*: On the north side of the Dos Cabezos mountains, in Cochise conuty, A. T., there is a canyon where considerable gold washing with sluices and "toms" has been done for ten or twelve years. Owing to the drought, little has been attempted for several seasons, bnt recent rains having made water plentiful, work was resumed. Some weeks ago the eyes of several Mexicans were gladdened by the sight of a splendid nugget, which weighed twenty-six onnces. Its breadth proved to be 3½ to 4 inches and its thickness 2 inches. A emooth solid nodule without any qnartz or waste, its rich yellow color would have made it slightly attractive even to a free silver-coinage man. At the Dos Cahezos village store it was considered by all who saw it as a fine specimen. It was good for a credit of something like $450.

BRITISH COLUMBIA.

Valuable Quartz Finds.—A dispatch from Victoria says that Government Assayer Carmichael has made a report to the Minister of Mines of a visit and investigation into the gold quartz mines discovered in the Alberni district, on the east coast of Vanconver island. His report fnlly confirms the news received of rich finds. Only one ledge had been developed to any extent, bnt the surface samples from the ledges located 20 miles distant in the same gronp of mountains were thickly incrnsted with gold. Assayer Carmichael thinks the snrronnding hills offer great inducements. The district is one day's journey from Victoria by water or rail and wagon road.

IDAHO.

Aoain at Work.—Wardner *News*: Mr. Bradley, manager of the Bunker Hill and Sullivan mines, says there are 65 men now at work for the company. The mill and tramway are in perfect condition and ready to run. The mine is in excellent shape, every stope is ready for its fnll quota of men, and the company is prepared to pnt on miners as fast as they apply. Under present conditions $3 per day is all they can afford to pay.

A Goon Statement.—De Lamar *Nugget:* Following ie a synopsis of the manager's report to the De Lamar Co. for the month of Angnst, 1893:

Tons crushed	3,203.26
Gold prodnced	$45,942 79
Silver "	33,384 90
Total	$79,327 69
Ore shipments	5,000 00
Other sources	1,909 03
Grand total	$86,236 72
Expenses of all descriptions	37,340 20
Estimated profit	$48,896 52

The Fay Templeton.—Murray *Sun*: The board, being re-organized for working purposes, leased the mine and mill to the Ward Bros., who are to pay the company $1 a ton for every ton of qnartz milled. The lease runs for a year, and the lessees think they can crush 9000 tons dnriug that time. Work has already begun to start up the plant. The history of the Fay Templeton is as checkered as that of the Idaho. The richness of the qnartz first found in the mine turned the heads of some of the owners, a company was organized with an avalanche of shares and every step of progress was marked by bad judgment and incompetency. All this resulted in the suicide of the promoter, Mr. Farmer. It has been satisfactorily demonetrated by spasmodic operations that the Fay will pay to work. The suspension for the past three years has been due to nnfortunate and violent fends among the directors and stockholders, and the general public has, in the main, heen the principal snfferer.

OREGON.

Blue Rivee Mines.—Eugene *Register*: Mr. S. C. Smith brings very encouraging reports concerning the work thst is going on in Blne River camp. Late prospects from the Cyclone and Dnrango claims are as fine as any that have ever heen seen. At a depth of 50 feet on the Durango the drillings were panned ont and showed a very fine prospect. The work on the road is progressing very favorably, and will be finished in about three weeks. Nine men are at work on the road. The Oregon City Company are doing considerable work on their claim and making preparations for the mill, which will be pnt in either this fall or next spring. The development of the mines depends largely upon the mill and the road, and there is no doubt now abont these.

To Work Cinnabar Mines.—Ashland *Tidings*, Sept. 23: The company which owns the cinnabar property at Cinnabar springs, 40 miles from Jacksonville by road and trsil, is preparing to do this fall and winter the $1300 worth of assessment work reqnired npon the 13 claims. B. M. Newcomb, snperintendent of the Napa Consolidated Qnicksilver Mining Co., owns a controlling interest in these cinnabar mines. Mr. Newcomb visited the property last week, spent two days looking it over, and was mnch plessed with the prospect in sight. He ordered contracts let for two tunnels—one of 200 and one of 300 feet in length. Wm. Patterson and J. W. Briner were on the gronnd with Mr. Newcomb and snbmitted a bid for the tunnel work. They have not yet been awarded the contract, bnt it will probably be given to them. J. C. McCnlly, who has been in charge of the mines for the past year or two, will superintend the work. Mr. Newcomb believes the mines will pay well. The mines which he is superintending near Napa, Cal., are now turning ont abont 800 flasks of qnicksilver per month.

Hill & Stevens, who have an extension of the Homestake mine claim near Woodville, struck the ledge with their prospect tunnel last Saturday, and found it more than 2½ feet wide.

Snpt. Drew, of the Hammersly mine on Jnmp-off-Joe, is greatly elated by the prospects since the mill started, and reporte that he has the pnrchase price of the mine ($40,000) in sight. Over $2600 was put on the dump in one day of last week from the prospect shaft.

Nickel Mine.—Riddle *Enterprise*: Dr. B. Mobr, the expert sent to make a report of the Nickel mines, hy the English syndicate, arrived at this place direct from London on Wednesday, and, in company with Will Q. Brown, proceeded at once to the Nickel mines to make an analysis of the ore. But little time was occupied by the expert in the analysis, and his report will no donbt consnmmate the sale.

White Swan Gold.—Baker City *Democrat*, Sept. 20: The White Swan mine is in again with a neat product for September. The cleannp was brought in yesterday and left at the Baker City National Bank. The bullion is valued at $3500, and is a yield of abont $200 per day with a ten-stamp mill.

Bullion Shipment.—Baker City *Democrat*, Sept. 18: The outpour of gold from the mines of Baker and Grant counties continnes, and it is safe to say that with the close of 1893 the yield will have been the largest ever recorded in the history of these counties. Again yesterday the First National Bank of this city made a shipment of gold bullion to the Mint.

The amount was about $7000 and is the output of several placer mines in close proximity to Baker City.

The Sproule & Sloan claim, better known as the Canyon Creek diggings, Grant conuty, contribnted 220 ounces, and the Carpenter placers at Pocohontas, and other claims, the balance of this neat shipment of the precious metal.

Goon Cleanup.—Baker City *Democrat*, Sept. 11: The Baisley-Elkhorn eent in another neat cleannp yesterday amounting to about $3000, which was left at the First National Bank for shipment to the mint. The prodnct is only a partial ontput for the past 30 days.

Thne far this season a large amount of gold dnst from the placer mines hae been brought to tbis city, generally partial cleannps, the final cleaning np for the year occurring later, or when the water supply begins to fail.

Yesterday Wm. Boswell, who with his father, W. S. Boswell, is operating placer mines on Bull Run, a tributary of the sonth fork of Burnt river, brought to this city $1000 in gold dnst and deposited the same at the First National Bank.

The latest news from Robinsonville ie to the effect that a body of ore has been uncovered in the Pyx mine that gives returns np in the thonsands of dollare to the ton. The Pyx mine is owned by Messrs. Cal Berry and Chas. Collier and is under bond to Mr. McKenzie and others of Montana, who recently put up hoisting works and are developing the property in a scientific manuer.

Making a Record. — Baker City *Democrat*, Sept. 23: The Red Jacket mine at Cornncopia, owned by the Oregon Gold Company, is at last making a record for itself. Its yield for the past two months reaches nearly the $20,000 mark and still continnes. Only a few days ago the *Democrat* mentioned the shipment of $8000 in bullion to Louisville, Kentncky, where the head office of the company is located, and now comes another ontpnt. Yesterday there arrived bullion to the amonnt of $3000 at the First National Bank in this city for ehipment to the mint.

Notes.—Jacksonville *Times*, Sept. 22: Ed Schieffelin, the well-known discoverer, is taking ont eome fine ore from the Little Bunknm ledge in Foots Creek district.

Lindley & Co., proprietors of the Lucky Bart

ledge in Sardine Creek district, have put in a mill and are crushing ore. A good report may be expected from that mine in the near future.

Drew & Co., who purchased the Hammersly ledge in Jnmp-off-Joe district, have their mill in operation and are crushing first-class ore. The mine is getting better as development progresses.

Prof. Moury informs us that he is arranging a big scheme in Elliott Creek district which promises good results. In company with C. A. Fuher and J. Weill of Portland, he has located several placer claims.

The Bohemia gold mines are attracting considerable attention, and from the showing they are making; it promises to be an important camp. There has been over $8500 worth of bullion shipped from Cottage Grove this season, besides several tons of concentrates, which increased the output to at least $10,000. Aboot 100 men are in camp, and the ledges that are being worked are showing np well.

WASHINGTON.

KETTLE RIVER PLACERS.—F. H. Oliver, in a special to the Spokane *Review* of Sept. 21st, says that reports have been received at Marcus, Wash., confirming rumors of a great placer find on Kettle river, above Boundary creek. The discovery was made almost by accident, from the Chinamen who have been working in there for the past month, and hot for the fact of their becoming excited, they would still have the field to themselves. Saturdav two Chinamen came down to Boundary Falls and had $2000 worth of gold exchanged for currency, and immediately started for Victoria, with the intention of bringing back enough Chinamen to locate the bar before it was known what they had found. The bar extends from the mouth of a small creek down the Kettle river for several miles, and the gold is supposed to come from this creek, which has never been prospected on accoont of its being in a conntry whinh it is almost impossible to penetrate.

ORE MILL RONNING.—Ellensburg *Localizer*: There is but one quartz mill now in operation in the county and perhaps in the State as well, and that is the Blewett mill on the Peshastin, which is running night and day, working three eight-hour shifts. The pay roll of this mill the last month was $6400. This camp in time will be a bnsy one. There is plenty of high-grade ore, but the parties owning the mines are too poor to get the stamps, which takes money these days.

UTAH.

AOAIN AT WORK.—Park City *Record*, Sept. 23: The Silver King mine is again in operation, work being resnmed yesterday afternoon at three o'clock with a force of ahout 75 men. The rnn, while practically an experiment, will last at least three months, as contracts have been made for ore that will require fully that length of time to fill. Supt. Kearns says that the preference for work has been given to men who have families to support and are fixtures in the camp, though enongh single men, old employes of the mine, have been put on to warrant the opening of the company boardinghonse. Underground wages will be the old scale, bnt top men have been cut down a few cents per diem. Whether the mine will rnn or not after the present contract has been filled, Mr. Kearns does not know, bnt the chances that it will, from the present outlook, are rather doubtful, and certainly not of a natnre to cause an influx of miners to this camp. If the tariff is taken from lead it will knock them ont in short order with silver at its present figure, as it would make a difference to them of over $11 to the ton. When the King shut down the ore hins were full of rock, and hauling to the sampling mill has already commenced.

Arrangements are being made to start np the Anchor mine, judging from the fact that the concentrator is being repaired and placed in order, and from what meagre information can he gathered from officials.

The fntnre of the Crescent is still in donht, and, while the concentrator is heing placed in order for a full rnn, there is mnch nncertainty as to whether it will start or not. It all depends on what terms Manager McGregor makes in reference to the sale of ores. The tramway will he started np and snpplies for the winter, soch as fuel, timber, provisions, etc., taken to the mine. A force of men will be put to work in the Alliance tunnel ahont the 1st of October, and the work of driving the same into Crescent territory commenced in earnest.

Weight of an Eagle.

Said C. K. Stout of the treasury office, as he sat hefore the scales with $8000 or $10,000 in double eagles at his elhow: "How many $1 hills do you think it would take to weigh as much as one of these coins?"

The reporter considered a moment and made a guess.

It takes just 27, unless the hills are trimmed close. Twenty-eight new $1 hills always weigh a little more than a douhle eagle. Don't you helleve it? Just wait."

He disappeared in the vault for a few minutes, aod presently emerged with a package of hrand new $1 hills in his hand. Then he counted out 27 of them and sald to the reporter, "Choose any coin you will."

The reporter chose a coin which Mr. Stout put on one of the scale pans. Then he put the 27 $1 hills on the other pan. The long needle that moves on the iodex showed that the beam was almost level. The man of money added another bill to the 27, and the coln went up.—Cincinnati Commercial Gazette.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 28, 1893.

The silver market has shown no new conditions during the week, and there has been very slight variation in quotations. Congress seems no nearer a termination of the discussion of the repeal measure than before, and meanwhile the market is in suspense. Reports from the silver-producing districts are to the effect that silver mines are starting up, generally on a basis of reduced wages and number of laborers. The Cœur d'Alene mines have been encouraged to start by the recent small advance in lead. It is stated that the mines can be operated at a profit when lead is not below $3.70. At Leadville, Colo., arrangements are being made to begin operations, and similar reports are received from other places.

Silver and the Metals.

NEW YORK, Sept. 28.—Following are the closing prices for the week:

	Silver in—

The Stock Market.

SAN FRANCISCO, Sept. 28, 1893.

The Comstock market has been very dull during the week, and sales have been much restricted. The prospective settlement of the wage question does not seem to have had much effect for the better. The Crown Point Mining Company levied another assessment, and it did not help matters. There are rumors that other assessments will soon be levied.

At the delinquent sales of the Ophir and Sierra Nevada Mining Companies the other day less than 2500 shares of each were sold for non-payment of the assessments. These shares were bought by outsiders, and neither company has a share in its treasury. The Sierra Nevada Company has a fat bank account of ahout $18,000, hut the Ophir Company is not so well off, and may ere long come in for another assessment.

The Gold Hill Miners' Union has re-voted on the question of wage reduclion and decided to accept 50 cents less by a vole of 107 to 37. The Mechanics' Union has also decided to reduce hy a vote of 74 to 16.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING SEPT. 12, 1893.

505,017—STOVE SHELVING—F. A. Anthony, Livermore, Cal.

504,859—AMALGAMATING PAN—M. P. Boss, S. F.

504,966—SPRINKLER—Caton & Warring, San Jose, Cal.

504,804—REFRIGERATOR—O. H. Fox, Delano, Cal.

504,973—SAND-HOLDER—J. H. Grinwold, Oakland, Cal.

504,922—PUMP—W. A. Hartt, Tucson, A. T.

505,044—ILLUMINATING TILE—H. Haustleo, S. F.

504,924—METALLIC TIE—P. H. Jackson, S. F.

504,928—PULLEY BLOCK—C. Matheson, Eureka, Cal.

504,995—SOLE AND HEEL PLATE—J. I. E. Nelson, Cedar Home, Wash.

505,002—ALMOND HULLER—W. G. Read, Colusa, Cal.

504,949—HEADLIGHT COVER—F. A. Stevens, Sacramento, Cal.

504,952—WINDOW SHADE—S. T. Stuver, Puyallup, Wash.

504,895—BUCKLE—F. W. Swigart, Arroyo Grande, Cal.

504,955—FLASHLIGHT CHARGER, ETC—S. M. Williams, S. F.

505,014—FLASHLIGHT BURNER—S. M. Williams, S. F.

504,956—FLASHLIGHT BURNER—S. M. Williams, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MEANS FOR UTILIZING THE WASTE PRODUCTS OF PETROLEUM.—Jacob P. Engle, S. F. No. 505,395. Dated Sept. 19, 1893. The object of this invention is to provide an apparatus by which those waste prodoots of petroleom which are mixed with water and of nearly the same specific gravity may be separated from the water. It consists of a furnace with mains of iron or iron hars laid within it, and jet pipes through which the petroleum waste and steam are injected into the fornace, where combustion takes placc.

CLUTCH MECHANISM.—Isaac F. Thompson, S. F. No. 505,257. Dated Sept. 19, 1893. This invention consists of a clotch mechanism in which the driving portion is connected with or disconnected from the part to he driven hy intermediate clamping jaws which are caosed to grip a flange, or to be loosened from it hy a pecoliar arrangement of levers, actnated from a collar slidable npon the shaft.

FREE ENOINE HAENESS.—Thomas Mnrphy, S. F. No. 505,410. Dated Sept. 19, 1893. This invention relates to improvements in harness nsed in connection with fire engines and apparatns, and it consists of antomatically operating devices hy which the harnesses are secnred npon the horses at the instant the latter place themselves by the pole, and the machine is ready to start at once.

SCEEW PROPELLEB.—A. D. Hall and Geo. B. Sloan, S. F. No. 505,402. Dated Sept. 19, 1893. This invention has for its object snoh improvements in screw propellers as will greatly increase their power and the consequent speed of the vessel to which they are attached. It consists of opposing blades, each forming about one-half a tnrn abont the shaft and exterior peripheral flanges, the action of the whole heing snch as to concentrate the action of the propeller into a line with the direction of travel and halance it at high speed.

STAMP STEM GUINE.—Hugh P. Grngin, Helena, Montana. No. 505,400. Dated Sept. 19, 1893. This device consists of a socketed stock throngh which the stamp stem passes. Within the stock are open-ended, longitndinally-disposed channels, opening into the central socket. Balls are seated and freely move in these channels and hear on the stem, and removable stops at the channel ends permit the insertion and removal of the balls. By the ose of this gnide mnch wear and tear is avoided and friction is redneed to a minimnm.

TYPEWEITINO MACHINE KEY CUSHION.—Robt. S. Graham and Wm. B. Savell, S. F. No. 504,065. Dated Aug. 29, 1893. This invention relates to attachments for the keys of typewriting and other machines which are operated by the fingers, and is designed to protect the fingers of the operator from the results of the continued blows to which they are subjected dnring the day. It consists of covers which may he easily attached to the keys of such machines as they are applicable to, and these covers are made hollow and elastic, to provide a soft snrface for the fingers to strike upon. Each cover is formed with the character of the key beneath indicated thereon, either in raised, colored or other forms.

The Noisiest Animals.

What animal can make the most noise? The elephant. During the hreeding season in the forests of India and Ceylon the trumpeting and roaring of the animals is continuons and terrific, and can he heard for miles. The fellne family are wont to scare their prey thoroughly hy their overpowering noise. Thus the roar of the adult lion is terrific, the windpipe heing enlarged so as to give the animal a larger volume of air, proportionately, than any other animal. The male gorilla has an awful, loud-sounding voice. When attacked it utters a short, jerking, acute hark, like that of an angry dog. To this sncceeds a low growling, which might be mistaken for distant thunder.—Baltimore American.

Welsh Americans.

The Welsh in the United States claim that they are in number as many as their countrymen in Wales, and they also claim that one of their ancestors forestalled Columhus in the discovery of America hy 272 years. They base their assertions on historical traditions and the manuscripts of old Welsh bards on the one hand, and on the prevalence of Welsh in many of the languages of the Indians, hoth of South and North America, on the other.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the Americau continent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Cal. Debris Commission Notices.

NOTIOE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from Louis Conrath, attorney in fact for the Excelsior Water and Mining Company, for permission to mine by the hydraulic process in the Blue Gravel Placer mine, near Smartsville, Nevada County, California, and to deposit tailings in an old hydraulic pit, hereby gives notice to all concerned that a hearing will he held at the office of the Commission, room 92, Flood Building, San Francisco, on October 17, 1893, at 1:30 o'clock P. M. On and before this hour and date all parties interested may file affidavits, plans, and maps, in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

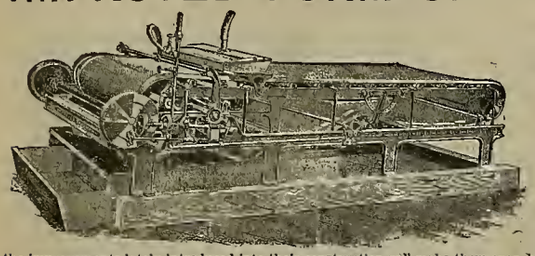
IMPROVED FORM OF "TRIUMPH" ORE CONCENTRATORS.



The annexed cut illustrates the **"TRIUMPH" CONCENTRATORS**, and shows the recent improvements which have been introduced into their construction, by which many advantages are gained over any other form of Vanners, Vanning Machines or Concentrators.

These advantages are obtained by reason of the fact, as will be observed, that the crank-shaft is now placed and fitted at the head of the Concentrator, clear of the belt and in direct view of the operator or attendant. This, of course, greatly facilitates the oiling of the bearings of the shaft and connecting rod and precludes the possibility of any sand or detritus, passing over the belt, from reaching or getting into the bearings.

The forms of the bearings and as well of the connecting-rod brasses have also been very much improved, making them stronger, simpler and more easy of adjustment. Important changes have also been made in the feed screw and quadrant for regulating the belt, with the view of making all parts of the machine stronger, more accessible and as easy of regulation as is possible.

We furnish the "TRIUMPH" Concentrators with either the plain or "Blasdel" Rifled Belt and shall be pleased to quote prices with the adaptation of either, as may be requested, and shall further be pleased to show one of the improved form, set up ready for operation, at our office.

REDDING, CAL., April 22, 1893.

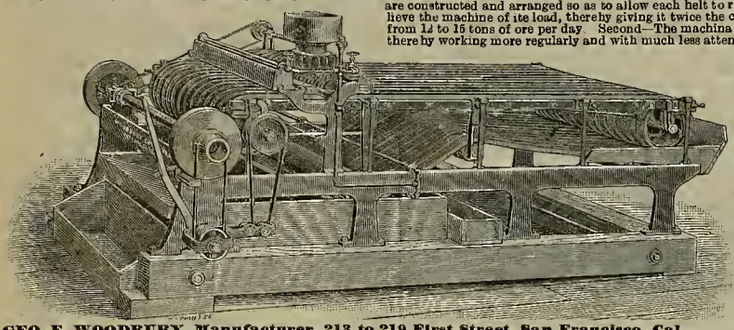
Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco, Cal.—Gentlemen:—Following the testimonial letter which I addressed to you December 9th, 1890, in relation to the superiority of the "Triumph" Concentrators over either the "Frue" Vanners or "Woodbury" Concentrators for concentrating our Texas ores, I hold now to the opinion then expressed; and with nearly two years and a half further experience in their operation I can confidently assert and am more fully convinced than then, that the "Triumph" Concentrators are better in all respects than any other form for concentrating our Texas and Bully Choop ores, and in evidence of such confidence I refer with pleasure to the order recently placed with you for four (4) of the "IMPROVED TRIUMPHS," to make up the complement required for use in the new twenty (20) stamp mill at the "Cleveland Consolidated Mining Co.'s mines in Bully Caoop Mining District in Shasta and Trinity Counties, this State, and I feel assured that the improvements lately introduced into their construction will make them even better than the old form which I have had in operation for so many years past in the different mills under my supervision. I am, very truly,

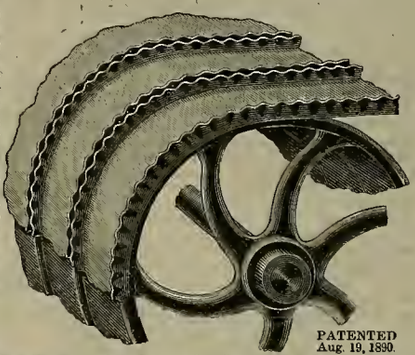
(Signed) R. G. HART, Sr., Manager Texas and Cleveland Cons. Mining Co's.

JOSHUA HENDY MACHINE WORKS, No. 51 Fremont St., San Francisco, Cal.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 14 to 15 tons of ore per day. Second—The machine equalizes the load by having several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allotted to it—in this way preventing the pulp from running to the lower side or it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything under in the most thorough manner, enabling it to run with very little attention or wear.





PATENTED Aug. 19, 1890.

[COPY.]

Eureka Tellurium Gold Mining Company, Redding, Cal., July, 21, 1893.—Mr. Geo. E. Woodbury, 213 First St., San Francisco, Cal.—Dear Sir:—We take pleasure in stating to you that the two Ore Concentrators purchased from you last April are giving perfect satisfaction. They are simple, durable and effective, and we hereby conscientiously recommend the "Woodbury" pattern to all intending purchasers of Ore Concentrators. Yours truly,

[Signed] EUREKA TELLURIUM GOLD MINING CO., by GEO. O. JONES, Secretary.

Electric Drills in a Quarry.

The electric percussion drill, since it was first put into practical operation, has undergone many changes, each in the line of improvement, until to-day it competes successfully either with steam or compressed air drill.

One of the most interesting percussion drill plants is that in operation at the limestone quarries of the Solvay Process Company, near Syracuse, N. Y. This plant has now been working continuously for several months and the results attained, both in amount of work done by the drills and the convenience and economy of their operation and maintenance, have given thorough satisfaction to the company first undertaking their general employment. Installed by the General Electric Company at the commencement of the past winter, the drills have operated without interruption from the intense cold, and have practically demonstrated the advantages derivable from the use of electricity in quarry work. Had steam been the only available power, conditions were such at this plant that the loss in transmission by condensation at 20° below zero would have been so great that the drills could not have been worked. The quarry, as will be seen from the cut, is situated in a desolate spot on an elevated plateau, where intense cold found full scope for action.

At the present time three "Type E" General Electric Company's drills are in continuous operation ten hours per day, drilling holes from six to ten feet in depth, and two to two and one-half inches in diameter at the top. The rate of drilling, according to the record kept by the superintendent, is from 45 to 75 feet per ten hours, averaging 50 feet per day, or 1500 feet per month of 30 days. The average distance of the drills from the power station is about 2000 feet at the present time, the circuit, three lines of bare No. 0 copper wire, being extended to a distance of 3000 to 5500 feet from the power station in one direction.

The manipulation of the drill is in every respect as simple as that of the steam or air drill, stopping and starting being accomplished by merely throwing a handle to the right or to the left, making or breaking the contact between the cable and the terminals of the coils. Not the slightest difficulty is experienced in lubricating the wearing parts or in handling the drill.

The general dimensions of the "Type E" drills, three of which are doing all the deep-hole drilling for the quarry, are: Length over all, 49 inches; outside diameter, wrought-iron tube, 7½ inches; length of stroke, 5 to 7 inches; blows per minute, 380.

The generator which supplies the power is of the bipolar type, running at normal speed, and is provided with a device for directing the current alternately into the upper and lower coils of the drills. The difference of potential at the fixed brushes of the generator is 240 to 250 volts.

The generator is belted to a 9″x12″ straight line engine, supplied with steam at 90 pounds pressure from a horizontal tubular boiler; fuel for which is brought for three miles over the cableway in the buckets used to transport the lime rock from the quarry to the works. As yet no estimate of cost of repairs can be given because up to date there have not been any. Should, however, any part break down, it can instantly be replaced, as all the parts are interchangeable. The company informs us that the plant has aroused widespread interest among quarry operators in general, and has been visited and carefully inspected by many less prone to reject the good things which advanced science offers. That electricity is

ELECTRIC PERCUSSION DRILLS IN A LIMESTONE QUARRY.

an ideal power for mine and quarry operation the working of these electric percussion drills does much to show.

The Plumas *National-Bulletin* urges prospectors to hunt gold. "Get out into the mountains and uncover a gold mine, quartz or gravel," it says. "It is far better to do this than to sit around and complain of hard times. A little more of the energy, push, ambition and nerve of the pioneers are needed to bring about an era of prosperity in Plumas."

Mineral Awards at the World's Fair.

The Bureau of Awards at the Chicago Fair this week made awards to the following for exhibits of minerals and gems:

Arizona—Collective exhibit of gold and silver ores in Arizona; collection of gold, Hubbard; silver and copper, Peabody mine; United Verde Copper Company, copper ore; Detroit Copper Company, Graham, collection of copper ore; Arizona Copper Company, Graham Company, copper ore; United Globe Copper Company, Gila county, copper ore; Jules Bauman, collection of copper ore; Old Dominion Copper Company, Gila county, copper ore; Christmas Gift, silver ore; Copper Queen Mining Company, copper ore; A. Baron & Co., Tombstone, silver, lead and zinc; T. E. Soria, Cochise county, collection of gold and silver ores; Tombstone Mining and Milling Company, Tombstone, gold, silver and lead ores.

California—S. S. Daisy, Grass Valley, collection of gold ores; California State Mining Bureau, collection of California marbles, onyx, etc.

New Mexico—Santa Fe, collective exhibit of silver ores; American Turquoise Company, New York City, turquoise; R. C. Thoeger, Hillsboro, collection of gold quartz, Sierra Company; New Mexico, Santa Fe, collective exhibit of gold ores; Mrs. J. C. Carrera, Las Cruces, collection of minerals; New Mexico, Santa Fe, collective exhibit of mineral resources of New Mexico.

Oregon—State of Oregon, collective exhibit of gold ores; Oregon Dell Mining Company, Sparta, Virtue mine, free gold; State of Oregon, collective exhibit of gold, silver, copper and lead ores.

Washington—Lookout mine and 31 others, Cascade, collective exhibit of argentiferous galena of Cascade mining district; State of Washington, collective exhibit of gold, silver and copper ores of Washington; State of Washington, collective exhibit of iron ores.

Utah—Ontario Mining Company, Park City, silver sulphurets and silver-lead ore; Cactus Mining Company, Frisco, copper ore and other minerals; Utah Territory, collection of silver ores; Wooley, Lund & Judd, St. George, collection of silver ores in sandstone; Daly Mining Company, Park City, silver sulphurets and argentiferous galena; Territory of Utah, collective exhibit of gold, silver and lead ores.

Wyoming—Uintah County State Board, Cheyenne, quartz and calcspar; State Board, Cheyenne, agate and marble mosaic; J. H. McClure, Hartsville, large moss agates; W. W. Bick, fossils and fossil fish; Welcome mine, Bear gulch, auriferous quartz; State Board, Cheyenne, collective exhibit of copper ores; State Board, Cheyenne, stream tin; State Board, Cheyenne, collection of tin ore.

Nevada—J. Grandelmeyer, Hamilton, collection of minerals; State of Nevada, mineral collection; E. G. Morrison, Eureka, mineral collection; Joseph Grandlinger, Hamilton, collective exhibit of ores; James Grandelmeyer, Hamilton, geological and mineral characteristics of metallurgical classification of ores.

Idaho—Snake River Opal mine, fire and peacock opals.

The MacArthur-Forrest (cyanide) process has been awarded a diploma of the first class, at the World's Fair, as the leading process for the treatment of refractory gold and silver ores.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 239.

No Official Publication.

It may be information to some people to learn that there is no "official publication" or "program" of the State Miners' Association. During the two preceding conventions a publication designated as such was circulated, but it had the sanction neither of the convention nor of the Executive Committee, nor of any of the officers. It was gotten up for advertising purposes only. It literally obtained money under false pretenses. Any publication claiming to be the official programme (outside of bulletins or announcements properly authenticated by the president, secretary or Executive Committee of the association) is a plain fraud.

GEN. HENRY L. ABBOT, of the Government Board of Ordnance and Fortification, has written a letter to Dr. Stephen H. Emmens, now in this city, stating that No. 259 Emmensite has been determined to be the best explosive for use in shells, and that the board will so announce in its forthcoming annual report. Gen. Abbot further says that after exposure to the damp air the ammonium nitrate and sodium nitrate of course absorb moisture, and change the powder into a soft material which packs very much more densely than in its service condition. "We find," says the general, "that 110 pounds in this state occupy the volume required for 87 pounds with 1000 feet velocity, and 25 pounds with 1400 feet velocity. We shall probably try higher velocities although many experiments with small charges reach 2000 feet." As an explosive for use in mines Emmensite is said to be well adapted. Its expense, however, is so much greater than dynamite that no attempt has ever been made to secure its introduction on this coast.

THE Mariposa *Gazette* is much encouraged by the recent activity in mining circles in that county. There are prospectors in almost every gulch and on all the gold-bearing mountain-sides. The men all seem earnest and determined to make Mother Earth yield up some of her long-hoarded treasures. There have recently been moneyed men in Mariposa inspecting the mines, and it is almost a certainty that two of the large mines have changed hands. A large quantity of machinery has just been brought to different mines of the county, and the miners appear sanguine of success. Altogether the prospects are brighter than they have been for a long time.

THE Pan-American Bimetallic League has been in session at Chicago during the week. Addresses were made by various silver men and resolutions against the repeal of the Sherman law and in favor of free silver coinage were adopted. It is declared also that the Western and Southern States and Territories should form a close political and financial alliance.

Importance of the Miners' Convention.

[By Mr. Charles G. Yale, Secretary of San Francisco County Miners' Association.]

It is not probable that the State Miners' Convention of Monday next will be so largely attended as was the first one, held two years since. At that time, representatives from every county of the State were invited to organize; but on this occasion representatives only come from those counties where there are County Miners' Associations. The basis of representation in the convention is one delegate for each ten members of a Miners' Association. This naturally restricts the number of delegates, and confines the proceedings entirely to those directly interested in the mining industry of California.

Heretofore the main interest in these Miners' Conventions has been confined to the discussion of measures looking toward the rehabilitation of hydraulic mining; but on Monday more attention will be given to the interests of quartz miners, drift miners, and those engaged in the petroleum industry of California.

The passage of the Caminetti act by Congress has placed the Government on record as desirous of seeing hydraulic mining resumed under the specified conditions. The State, also, is on record, by its legislative acts, as favorable to the industry. The hydraulic miners themselves, while not entirely pleased with the new law, find that they can legally resume mining by complying with its conditions, whereas before its passage there was no way of doing this.

The law is, however, still on trial as to its practicability. The main feature upon which it is based, that of impounding dams for storing the debris, is entirely an engineering question, so that it is eminently proper that the operation of the law should be left entirely in the hands of a commission of Government engineers. These gentlemen are eminently qualified for their task by profession, education and experience. It is proper to note that the Anti-Debris Association has set its face against dams of any kind, contending that they will not hold back the debris properly. In this they take issue not only with the law, but the expressed opinions of engineers. Formerly attention was paid by the public to this association, but its influence has waned since so many of its utterances and acts are founded on mere prejudice. They want to prevent hydraulic mining even when the miners are doing their best to impound the debris, and wherever possible throw obstructions in the way of the miners obtaining licenses from the Debris Commission.

At the Miners' Convention some suggestions will be made looking toward certain amendments to the Caminetti act, but none of them are radical. Those which will be considered refer to certain details to facilitate the operations of the law.

The main topic of discussion will doubtless be the Stewart bill, which proposes certain radical changes in the existing mining laws of the United States. This bill has not come before Congress at this session. For three successive sessions, however, it has been introduced by Senator Stewart of Nevada, and will doubtless come up again before long. Its provisions have been pretty thoroughly discussed in the columns of the MINING AND SCIENTIFIC PRESS, and particularly by your intelligent correspondent, J. D. Emersley, of Dos Cabezos, Arizona, who has shown up its objectionable features in a very decided way. He is a prospector and miner and knows how such a law would affect the interests of those classes.

The drift miners of this State long since protested to Senator Stewart against certain features which damage their interests, but to this protest he has paid no heed. The points have all been discussed in your columns. Under Stewart's bill the drift miners are permitted to patent such very small tracts that they will be unable to run the long bedrock tunnels necessary to open such claims. It would not pay to run the tunnels unless they could obtain title to larger tracts in one piece. It is this same feature to which the petroleum men object.

Some attention will doubtless be given to the absurd rulings of the Department of the Interior and the Land Office, which, in many cases, practically set aside the law. This department-made law has greatly injured the mining interests, and the attention of Congress should be called to it.

Pending proceedings in Congress or rulings of departments have never been discussed by miners as a body, until the organization of the California Miners' Association. Individuals have protested in vain. Joint action has been necessary to engage attention. It was this which brought about the passage of the Caminetti act. If the miners will continue united, some attention will be paid to their demands. They know best how new laws will affect their interests and should have something to say before they are passed. The Miners' Convention can give expression to their ideas on these subjects, and the Executive Committee of the State Miners' Association can attend to the details. In fact, the main work falls upon this committee, and it should be carefully chosen. No one should be placed upon it for mere compliment. What is wanted is men who will give some time to the work of the committee.

Every encouragement should be given to the miners of this State by the press and the public. California has always been the largest producer of gold of any State in the Union. Its annual output could readily be doubled could the hydraulic mines all work, and did capital more freely aid the quartz and drift miner. California is so far distant from the great centers of population that it is in a peculiar position. It must attend to products which will bear distant transportation, or must restrict them. We amount to nothing as a manufacturing State, for we have no coal or iron. Our gold mines and our horticultural and agricultural products are our mainstay of prosperity. It seems strange, in view of this, that gold-mining has received so little encouragement. Our mineral products are varied, but most of them are in a backward state of development through lack of capital. People from other States recognize their value more than we do ourselves. The gold mines are sought after more to-day than they have been in twenty years past. There is more demand for this kind of mines. Our laws should encourage the miner, not discourage him; should aid, not hinder him in his efforts to obtain proper title, or to develop his claim.

These annual conventions of the miners of California are good things for the men themselves and for the industry. They show there is unity of action, and that the "miners' movement" is continuous and active. They keep up the interest in the county associations and prove the necessity and usefulness of the State Association, for to the Executive Committee of the latter organization is entrusted the carrying out of the wishes of the convention.

CHARLES G. YALE.

Important Work to Be Done.

[By Mr. W. C. Ralston, Secretary of the State Miners' Association.]

I regard the forthcoming convention of the State Miners' Association as not less important than the two which have preceded it; and I am satisfied that its influence on legislation will be even more direct and certain. Our association is now the recognized medium through which the miners of California express their desires; and it may fairly be expected that the conclusions of the convention will be the embodiment of their sentiments on the various questions affecting their interests. It may be assumed that the entire California delegation is friendly to and will advance our interests in Congress in every legitimate and practicable manner; but the particular representitives on whom we rely are Senator Perkins, Senator White, and Congressman Geary, and Congressman Newlands of Nevada, who has large interests in this State. Congressman Caminetti is no longer on the committee on mines and mining. His place has been taken by Congressman Newlands.

The association is authorized to speak for all mining interests—quartz, drift, placer and hydraulic. It is its cardinal purpose to assist all equally. It has the welfare of the quartz miner just as much at heart as the hydraulic, the drift as much as the placer. It helps most those who most need help. For that reason it has been obliged in the past to devote a large part of its time to an effort for the rehabilitation of hydraulic mining. A part of its work has been achieved. There is not a quartz or drift miner in the State who does not rejoice over the brighter prospect before his co-worker in hydraulic beds, and who does not augur therefrom that the association may do much for him. And that is exactly what it is proposed to do.

The work before Monday's convention was clearly outlined in the president's call. The Stewart mining bill, the rulings of the federal land department, and the Caminetti law are among things to be considered. The Caminetti law is not what the previous miners' conventions asked for. Several amendments are needed, and in justice should be made. The Midwinter Fair will undoubtedly be endorsed by the convention. The design now is to have several of the leading promoters of the fair address the convention and explain its scope, purpose, and probable benefit. The convention will be asked to aid a movement for a complete exhibit of the mineral resources of the State.

The convention will doubtless consume Monday and Tuesday in its deliberations. I have been notified of the appointment of delegates from a number of counties and the attendance is certain to be large.

W. C. RALSTON.

THE list of delegates to the State Miners' Convention, so far as reported to Secretary Ralston, will be found on page 257.

The Stewart Bill and the Petroleum Interest.

[By Mr. George Loomis, President and General Manager of the Pacific Coast Oil Company.]

The provision of the Stewart mining bill that no more than forty acres of petroleum ground can be included in one application for patent is, to my mind, a serious objection to its passage. Conditions must be extraordinary and unusual where a petroleum tract of only forty acres is valuable enough to justify the large expense necessary to develop it. All familiar with the industry know that no corporation will undertake to develop a petroleum claim until it has secured a large extent of territory, for the reason that enormous expense is necessary in the purchase of the adequate outfit needed to produce, refine and market petroleum in commercial quantities. Appliances for sinking wells and pipe lines, cars for transportation of the crude product to the refinery, tankage of large capacity, and an elaborate business organization, must all be provided, and at great cost. A refinery is likewise generally necessary to be constructed, if it is not desired to sell the crude product to others. The probable petroleum output of no single forty-acre tract that I know anything about will justify this outlay; and no forty-acre tract, or any other area of ground, can be worked in a satisfactory and economical manner without it.

I do not mean to say that wells cannot be sunk and petroleum secured on a 40-acre tract by small operators, at an expense of, say $8000 or $10,000; but I do mean that the cost of operation will be proportionately much greater than with large companies, and they will be obliged to sell the crude output for what they can get, which may or may not be full market price. I understand the purpose of this provision of the Stewart bill to be advancement of the interest of small operators; but I am satisfied that its practical operation will be directly the contrary. It will, of course, not affect the patented holdings of corporations at present operating; and it will prevent future concerns from entering into the industry on a large scale. The inevitable tendency will be to give a monopoly of the business to the present large concerns. Small operators cannot enter the business except on terms made by big operators.

The importance and necessity of a sufficient area of workable ground are therefore apparent.

Of course it may be said that nothing in the Stewart bill prevents any individual or corporation from acquiring unlimited territory after patent, by purchase or otherwise; or from performing assessment work through its agents on separate subdivisions before patent. The objections to the latter method ought to be obvious. It is necessary to perform annual assessment work on each subdivision, with a total separate expenditure of $500, before there is a right to a patent. It would certainly be undesirable to be required to make separate expenditures on these various subdivisions, when it might and doubtless would be necessary to confine the expenditure to one place.

But we have much more serious fault to find with the rulings of the General Land Office than with any proposed law. Under present construction of law, it is most difficult to obtain patent to petroleum ground. The Land Office holds that the known and undisputed presence of the ledge is not sufficient ground on which to grant a patent; nor is it enough to show seepage. But petroleum must actually be produced in paying quantities before title can be secured. I consider this holding an error and a grievous and unnecessary burden upon the industry. Miners for metals can secure patent as soon as it is shown that mineral is in the ground. Requirements for petroleum-mining ought not to be more severe. I hope some means may be found by which the rulings of the department may be amended.

GEO. LOOMIS.

THE plan adopted by miners along the Arkansas river, Colorado, to save the fine gold, is as follows: Sluices are used, and copper plates are placed in the last string of boxes. They are from 20 to 30 inches wide, and six to ten feet long, coated with quicksilver, and protected by a heavy wire screen resting on slats about an inch thick. A light head of water is used, the gravel shoveled into the boxes, the coarse gravel remaining on the screen; while the fine dirt, going through the screen, falls directly upon the plates. This arrangement is said to save the float gold, which it is impossible to do in ordinary sluicing.

IT is expected that the necessary appliances for the operation of machinery at the Midwinter Fair will be supplied by various machinery establishments free of charge to the exposition, in much the same manner as at Chicago. Local dealers had a meeting the other day, and the sentiment was expressed that boilers and other machinery should be placed at the disposal of the fair management. The feeling among machine men is that a creditable exhibit should be made, and there is no doubt that they will be very well represented at the fair.

A New Impounding Device.

An Invention for Disposing of Debris in Hydraulic Mining.

Just at this time, when great activity exists in the direction of efforts to resume hydraulic mining in California, it may be interesting to know that the records of the Patent Office at Washington show that in November, 1892, Ahel M. Rawson of San Francisco secured a patent for a novel and ingenious method for impounding debris in hydraulic mining. The invention has never been called to the attention of miners through the press, and the fact of its existence is hardly known. Mr. Rawson made a careful study of the scene of hydraulic operations, and his invention was worked out with great care and patience. As to its merits, they can be judged from the annexed description of its working.

It is claimed for the invention that, as the principle employed in precipitating the debris is gravity, together with a dam and settling basin, it can be used in any situation where a dam and basin can be introduced, and with far better results than with any other method heretofore devised; and as this is the only patented invention covering the ground, it behooves miners to inform themselves concerning it.

While the invention was originally designed for mining in side gulches, out of the way of torrential streams and where the amount of surface water from rain and melting snow is not great, it is claimed that it can be employed in the largest watercourses, where the torrents are heavy, with better results than any other plan contemplating a dam and settling basin. Thus, if the Government should come to the assistance of the miners by constructing large impounding works at the points where the rivers debouch into the valley, it is claimed that the Rawson invention is better for the purpose than any other that has been suggested.

Generally, under the old plan of impounding, the water from the monitors, after passing through the sluices, is turned into the *upper* end of the settling basin and allowed to flow over the dam at the lower end. This, of course, sets up currents in the basin and prevents the perfect settlement of the fine clays in suspension, and they are the dangerous element.

The Rawson invention completely reverses this process. Instead of turning in the water at the upper end of the basin Mr. Rawson carries it, by means of a lateral ditch or flume, or a flume passing over the basin, to the dam, and discharges it above the dam, from a transverse flume resting on the dam, openings being made in this flume at convenient intervals. Instead, further, of permitting the water to flow over the dam when the basin is full, he runs one or more discharge pipes, of sufficient capacity, along the bottom of the settling basin. This pipe passes underneath the dam and discharges in the gulch below. Its upper end is carried to the extreme upper end of the basin where the water is perfectly still and where precipitation of the silt proceeds rapidly. There it takes the clarified water and passes it out underneath the dam.

It will thus be seen that the radical points of novelty are these:

1. The debris-carrying water is turned into the *lower* end of the basin, instead of the upper end, leaving the upper end perfectly still and free from currents, so that precipitation of even the finest silt will be rapid.

2. No water is permitted to flow over the dam, thus eliminating a great source of danger to the dam itself.

3. The water is discharged by means of pipes running along the bottom of the basin and underneath the dam, the receiving end being at the undisturbed *upper* end of the basin, where precipitation is rapid.

With the precipitation of the debris the bottom of the basin rises and its capacity diminishes. The invention provides in two ways for this condition, as follows:

First, the dam can be built higher, the settlement and annealing of the coarse gravel against its upper face constantly adding to its strength and thus making the cost of raising it less than in those methods in which the water is turned in at the upper end of the basin.

Second, the invention contemplates, by employing simple devices at the openings along the transverse flume, the precipitation of the coarser gravel against the upper face of the dam. In this way it is assumed that this bed of gravel, thrown across the whole width of the basin and against the upper face of the dam, can be made to grow by accumulation, eventually forming a crest higher than that of the dam, and that when this crest rises to the height of the transverse flume the latter can be advanced up the basin a short distance and a new gravel crest formed as the other. This process can be kept up indefinitely, the idea being that the dam is to act as a lodgment for the accumulation of a gravel dam, which will become solidified by the action of its cements. If this idea should prove successful in practical application, it is evident that the dam will not have to be built up as the basin fills with debris, but that the real impounding dam will be that which the gravel makes—a self-constructing dam, in fact.

As the basin advances up the gulch more joints are added to the upper end of the discharge pipe, so as always to keep the receiving end at the extreme upper end of the basin.

For disposing of whatever surface water may occur in the side gulches it is evident that there is at hand a carrying capacity double that provided for disposing of the hydraulic water. If a storm should occur the mining operations can be temporarily suspended and the surface water led out of the gulch into the ditch or flume provided for carrying the hydraulic water down to the transverse flume at the dam and discharged below the dam through a gate. If this should not prove sufficient to carry off the surface water the surplus may be taken out through the discharge pipe passing from the upper end of the settling basin underneath the dam, extra lengths of pipe being temporarily added for that purpose.

Further means of disposing of surface or torrential water are matters of engineering detail and will occur in any plan employing dams and settling basins. The Rawson invention rigidly prohibits the taking of this water into the settling basin and the flowing of any water over the dam.

ELEVEN MINERS arrived in this city from Alaska last week, and report having had a very hard time in the Yukon district. They labored mostly on Forty-mile creek, a tributary of the Yuhon, 40 miles below old Fort Reliance and 1700 miles up from St. Michaels. They say that mining in Alaska is like a lottery—some strike it, others do not—an experience that holds good in other countries than Alaska. The hardships that beset mining in parts of Alaska are undeniably great. An instance is recalled by the writer: Over four years ago he met a miner who had come down the Stickeen river on the ice from across the divide, where he had been all winter, with absolutely no communication with the outside world. He first heard of the result of the presidential election of 1888 in April, 1889. On the journey down a heavy thaw set in, and the ice broke up. His Indian attendants deserted him with their dogs. After incredible hardship, he landed on an island at the mouth of the river. Secreting $10,000 of gold dust in a tree, he constructed a raft, and by 24 hours hard work managed to reach Fort Wrangel, a few miles distant. He returned in a boat for the gold dust. But this is an exceptional instance. Near the coast the Alaskan climate is much milder than is generally supposed.

AT a meeting of the San Francisco City and County Miners' Association on Wednesday, Henry Pichoir was chosen president and Charles G. Yale secretary for the ensuing year. The following additional officers were chosen: Vice-presidents—G. W. Grayson, A. J. Ralston, Samuel J. Hendy, J. O. Whitney and B. F. Dunham. Executive Committee—C. W. Cross, S. K. Thornton, W. W. Montague, I. C. Stump, W. H. Crocker, Louis Sloss Jr., Thomas R. Church, William Irelan Jr., John Birmingham, W. Steinhart, W. H. Merry, D. M. Burns, Thomas Price, W. T. Y. Schenck, George H. Sanderson, James G. Fair, J. L. Flood, Louis Glass and J. K. Firth. It was decided that the county association indorse the Midwinter Fair, and any action the State Association may be pleased to take toward furthering the idea. A committee consisting of Samuel J. Hendy, Charles G. Yale and A. J. Ralston was then appointed to call upon the directors of the fair so as to be able to make a report to the convention as to the wishes of the fair commission. Delegates were also chosen to the State convention. The list may be found on page 257.

UNITED STATES patent has been issued recently to Chas. J. Farwell of London, England, for treating refractory ores. This process is for treating ores carrying precious and other metals, to oxidize and eliminate the associated sulphur, arsenic, antimony and tellurium compounds by subjecting the crushed ore in a fine, free-falling stream to increasing degrees of radient heat and a reversely flowing current of hot air and steam, out of reach of contamination with the furnace gases, the particles of incandescent ore being then quenched in cold water to split up the particles, remove scales and generate steam to assist the oxidizing and desulphurizing action of the air. The new process is preferably carried out by means of a furnace formerly patented by the inventor. The Deadwood *Times* says: A laboratory test of the method was made at Cheyenne, Wyo., by Fr. Farwell on ore from the recently-discovered mines near Lander, which proved highly satisfactory, so much so that local capitalists have formed a corporation for the purpose of erecting works to be operated under the process and patent.

Slickens.

JOHN DAGGETT of California, superintendent of the Mint at San Francisco, has been confirmed by the Senate at Washington.

THEEE is said to be no let up to the gold excitement in Alherni, British Colnmbia, the latest find heing a vein of free gold from fonr to six feet wide, in which gold is visible to the naked eye.

THE Veta Madre Mining Co., recently incorporated here, propose to work and develop what has heretofore been known as the Bright mine near Jackson, Amador county. It is expected that the new company will commence active operations dnring the early part of next month.

THE Martha Washingtou Mining Co. of Oakland has heen incorporated. Capital stock, $500,000, with S. Gertrnde Smyth, M. H. Kenny. C. L. Flint, P. T. Burrell and Mary T. Littlefield of Oakland, E. J. C. Gilbert of Berkeley and Amelia Griffith of San Francisco as directore.

THE Golden West Consolidated Gold Mining and Milling Co. of Sheep Ranch, Calaveras county, has been incorporated. Capital stock, $200,000, with W. G. Mills, C. B. Mills and Harvey Childs of Sheep Ranch and Thos. C. Archer and Ethan M. Wilson of Los Angeles as directors.

THE Daisy Hill Mining Company has heen incorporated in San Francisco with $500,000 capital stock, half subscribed. C. A. Roberts holds most of the stock, and his associate directors, each with five of the $5 shares, are Alfred H. Walker, C. H. Kingsley, Charles H. Taylor and A. Evelyn Ball.

W. T. PHIPPS, manager of the State Anti-Debris Association, has returned from Washington, where he weut to confer with the Senators and Congressmen regarding pending and prospective legislation affecting the valley interests. His report will be made to the association, and he is not now very communicative.

ME. W. B. SOESBY, a New York capitalist, prominently interested with the Playa de Oro Mining Company, of Ecuador, has been in Sau Francisco for some days making arrangements for the shipment of the final consignment of machinery to Ecnador for operation of the mines. He returns shortly to New York, whence, with President C. C. Francklyn and others of the company, he will proceed to Ecuador.

IT is said to he the intention of the South Yuba Company to push their ditch through to Clipper Gap hy next summer. Mr. W. M. Baker, for the company, has been visiting the farmers along the proposed route from the present terminus of the ditch at Long ravine to Clipper Gap, in order to secure their signatnres to an agreement granting the company a right of way. He visited the farmere and land-owners in tbe Colfax district last week; every oue eigned.

THE Consolidated California & Virginia Mining Company dropped 20 men from the force employed in the underground operations last week. The reduction was made in compliance with an order from the Trustees. The gradual exhaustion of the ore resources above the Sutro tunnel level is snrmised as the cause of the order. There is a large cash balance in the company's treasury, and the bullion output this month will leave a fair margin above operating expeuses.

A DISPATCH from Chicago says: George F. Kunze, of the Mines and Mining Building, assisted by Dr. Huntington of Harvard, polished two diamonds with the dust of meteoric iron found at Cenon Diable, Ariz. This is the first time diamonds were ever cut, ground or polished except with diamoud dust. Prof. Kunze, in a paper read before the Chicago Academy of Sciences, characterized meteoric dnst as a diamond or a substance fully as hard. The experimeut attracted great attention, as it was entirely novel.

SUPERINTENNENT DAGGETT of the Mint has notified William Andrews, for 12 years humid-assayer of the Mint, that the position will he aholished. Mr. Andrews, therefore, goes out. The following appointments are announced: Adjosters—Mrs. D. Green, Miss Mamie Hogan of Placer connty, Miss Cornelia H. Ballard of Sonoma county, Miss Cornelia L. Nokes, Miss Annie McGreeny, Mrs. Lena McNevin; assistaut engineer, P. A. Kearney of Alameda; fireman, B. Halse; conductor, Addison Bassett; Henry Ream, workman in coiner's department; David Adderson, sweep-cellar operative; O. C. Hewitt and A. D. Pratt, helpers in refinery department.

COLORANO PAPERS report an interesting discovery on the Nil Desperandnm claim, Cripple Creek, in a shaft heing snuk on the Something Good lead, which has heen traced into this ground. It consists of gray copper in a streak lying close up against a streak of crystallized quartz, which latter shows considerable free gold. Some gray copper has been found in the Bogart claim, which lies abont half a mile northeast of the Nil Desperandum, which yields about 100 ounces silver to the ton. Native copper has been found in small qoantities ou several properties in this gulch, bnt thus far tbis is the first instance where the two minerals, gray copper and free gold, have been found in the same vein.

THE liveliest town in Colorado is Cripple Creek, says the Denver *Mining Industry*. Its gold production is constantly increasing, and the growth of favorable opinion regarding its fnture keeps even pace with the increase. Population is growiug, and it is safe to say that at preseut rates it will numher from 15,000 to 20,000 by next spring. The ontput of smelting and stamp-mill ore of Cripple Creek for the month of August is reported as follows: Smelting ore, 913 tons, valued at $115,960; numher of tons treated at the stamp-mills, 4352, which yielded $47,031 in gold; placer gold aud ore treated at cyanide mill, $12,809, which hrings the total value of the outpnt for the month to $175,000. The Septemher returns will exceed the August hy at least $25,000.

THE burlap process of saving gold, which is working satisfactorily in Idaho, is this: In the hottom of ordinary rocker a hurlap sack is placed. The gravel and sand are thrown upon what is called a grizzly or big iron sieve. The larger pieces of rock are hrnshed aside, the finer particles falling into the rocker. The flour gold settles in the meshes of the sack. Every day the hurlap is washed in a tub of clean water and the fiue particles of gold are thus secured. The Homestake Company for several years past have used Brussels carpet for the same purpose, over which the tailings from the mills are allowed to rnn. When the carpet becomes so saturated that it will not take up more, it is removed and hurned, and the result always proves profitable.

THE Chicago correspondent of the London *Mining Journal* is not pleased with California's miueral exhibit at the World's Fair. He says in the issue of Sept. 16: "The Californian exhibit is disappointingly small for so prodnctive a State. The writer, when visiting California iu April, noted the general apathy of its leading mining people iu regard to representation at the World's Fair. Hydraulic mining has for a considerahle time heen almost entirely prohibited in that State, and mining generally appeared to be iu a somewhat depressed condition. The exhibit in the Mines building has, however, heen saved from insignificance by the energy of the Commissioner and of the State Mineralogist. The most popular of the exhibit is a collection of historical relics, inclnding some of the first gravel-washing appliances used. Some interesting specimens of cinnabar from the New Almaden quicksilver mines are included in the collection of ores. There is a good display of marble of various kinds, of which the pavilion is partially constructed. In the east gallery of the Mining building the New Pedrara Onyx Company, of Lower California, a Mexican territory, has a fine exhibit of slahs and other specimens from their onyx quarry."

Foundry Notes.

MRS. EUGENIA SHELBY, of Portland, Or., has been designated by the Common Council of that city to touch the button that starts the hattle-ship Oregon down the waye on the occasion of her launching.

WM. H. MILLEE, with F. A. Huntington, has received the following telegram:

"CHICAGO, Oct. 4, 1893.

"Announcement of award to Woodbury concentrator. Feeling well. GEO. E. WOONBURY."

DISPATCHES from Chicago state that the bureau of awards has made an award for exhibit of street cars and aerial appliances to A. S. Hallidie for passenger and grip car, ropeway and grip, historical collection of cable systems of pulleys; California Wire Works, wire ropes and cables.

Bunker Hill and Mayflower.

Dr. Stephen H. Emmens, of Youngstown, Pa., haa arrived in San Francisco, and, with his son, will take up hia headquarters here pending the development of the Mayflower mine in Amador county, and the resumption of work on the Bunker Hill. Dr. Emmens ia lessee of the mines and the former Bunker Hill mill and chlorination plant. The Mayflower is a virgin property, adjoining the Bunker Hill, and it appeara to be a very good one. A shaft has been sunk over 300 feet, and by crosscut a big chimney of rich ore has been struck. Ten stamps of the mill have been started, and ten more will soon be at work. The mill is a part of the Bunker Hill plant, but it will hereafter be known aa part of the Mayflower. There are 40 atamps.

The Bunker Hill haa long been known as a good property. With the Mayflower it was part of the assets of the Spring Garden Bank, of Philadelphia, and operations were suspended following the troublea of that inatitution. The main ahaft is down now about 800 feet, but there are 500 feet of water in the mine. It ia proposed to drain the mine—a feat that will take about five months—and continue the work of development in connection with the Mayflower. The properties will be developed by separate companies, but Dr. Emmens will act as general manager of both. Twenty atamps of the Mayflower mill will be devoted to crushing Bunker Hill ore until the company is in ahape to construct a mill of its own, or some other arrangement, such aa the enlargement of the Mayflower mill and works, is made. There is much low-grade ore now above water level, and it will probably be worked while pumping is going on. It ia deaigned to extend the shaft about 400 feet more, where it ia believed a lower zone of high-grade ore will be atruck. The Bunker Hill has yielded richly in the past, having turned out over $1,000,000. The Mayflower is doubtless just as good a property.

Dr. Emmens will leave shortly for the mines. While in Amador county, it is hia intention to make a critical peraonal examination of the mother lode and ita geological formation. The result of hia inveatigations will probably be embodied in a monograph, which will no doubt be a valuable contribution to literature on the aubject. Dr. Emmens, who has apecial knowledge on many mineralogical aubjects, ia well known as an authority in metallurgical and mineralogical circles, and his views are quite generally aought and heeded. Among recent articles from his pen are papers on "The Treatment of Zinc-Lead Sulphidea" and "The Metallurgy of Nickel," in the well-known work, "The Mineral Industry" for 1892. He has established headquarters at room 165, Crocker building, San Franciaco.

THE Tuolumne *Independent* of Sept. 30th gives a complete review of the mines of Tuolumne county, and announces that hereafter it will devote more space and attention to the mining industry. The example of the *Independent* is commendable.

THE place and time of meeting of the State Miners' Convention are at San Francisco, Pioneer hall, Fourth street, near Market, October 9, 1893.

The Great Playa de Oro Placer Fields.

It is altogether probable that the coming year will witness the consummation of a placer mining project in South America by American capitalists that fairly rivals the largest schemes ever projected by California hydraulic miners, and that in its ultimate fruition is expected to exceed in dimensions and results the largest single similar enterprise undertaken anywhere in the world. The Playa de Oro placer fields in Ecuador are believed to be the richest and most extensive new properties yet discovered, and the work of development has been undertaken by an investment and in a manner that indicates both the good faith of the owners and their thorough conviction of the value of the placers.

The history of the enterprise and the plans of the Playa de Oro Mining Company are sufficiently interesting to justify a brief review. One year ago the late Dr. Henry De Groot, after thorough investigation, contributed an extended article on the subject to the MINING AND SCIENTIFIC PRESS. With that exception and with the exception of one or two other recent local publications which were erroneous and misleading, the company has not appeared much in public print. It has, in fact, been a part of its policy to perfect its plans quietly and to avoid publicity as much as possible. About two years ago Otis S. Gage, of New York, while on a business visit to the city of Guayaquil, in the Republic of Ecuador, met there a banker named Jose Maria Borja, who gave him information about three Spanish grants located in the Province of Esmeraldas, and which were represented to contain extensive placer deposits. The title to one of these properties rested in the banker. These placers are worked by the negroes who inhabit the country, but in such an inefficient way that they afford the owners no revenue. As a consequence, he was anxious to have them pass into the hands of parties who could make their wealth available to all concerned. Senor Borja had arranged for the mines on his grant to be examined and reported upon by Clarence E. Dougherty, a mining expert who had resided in Ecuador for 20 years. Encouraged by the statements made in this report, Mr. Gage took an option on the three properties, which, on his return to New York, he passed over to syndicates of capitalists, who sent F. S. Ketchum, an experienced mining expert and engineer, to further examine and report upon them.

A little later, Russel F. Lord, C. E., E. M., was dispatched on a similar errand in connection with the Playa de Oro property, he being further charged with the duty of selecting a suitable point at which to commence operations, make estimates for plant, etc., if in his opinion the proposed investment promised to be a good one.

Two of these Spanish grants—the Playa de Oro and Cachavi—are now owned by American corporations, each company assuming for its title the name of the grant.

The Playa de Oro property is about 11 miles distant from the town of Concepcion, as the river flows, and is on the Santiago river, a large and rapid stream flowing through the estate in a westerly direction to the Pacific. It is from 500 to 800 feet above sea level. The property forms a parallelogram, comprises 20,000 acres, and is joined by the Uimba estate on the north, and the Cayapas river on the south. Gold-bearing beds cover the whole extent of the property, but only the gravel banks of a thickness of from 30 to 80 feet it is proposed to work. From the separate reports of the several engineers who have made personal survey and examination of the gravel beds, the following statements are taken: The gravel banks are exposed everywhere along the hanks of the river; in the numerous cuts made by the natives in their efforts at mining, which is their only means of subsistence; along the gulches (quebradas); and everywhere that the soil, which averages about four feet in thickness, has been removed. The auriferous gravel beds average about 50 feet in thickness and only in one place was the bed found but 15 feet thick, while in many places it is 80 feet. The gravel is auriferous throughout, the presence of a small percentage of clay having prevented the bulk of the gold siuking to the bedrock, a soft formation, apparently of marine origin. The elevation of this bedrock ahove the outletting streams varies from 20 to 100 feet, insuring everywhere ample dump for tailings. As the gravel here contains no pipe-clay, hard cement or large boulders, it can be broken down and washed with a moderate head of water. No bedrock tunnels, derricks or powder blasting will here be required.

A cut in the Medio Mundo bank, near the town of Playa de Oro, has heen worked back some 300 yards from the river through gravel 45 feet thick, exposing the bedrock for that distance. It shows a good grade for sluices and dumps, its elevation being 50 feet above hedrock and washed by natives in their crude way yielded 97½ cents gold. Other washings of single cubic yards yielded various amounts. But the most satisfactory test has been made within the past six weeks, under direction of Engi-

neer Lord. Eighteen cubic yards were measured, worked and washed through sluices in exactly the same manner as it is proposed to develop the placers. The yield was 38 cents per cubic yard.

Rains in Ecuador are constant, and the water supply is enormous. At the town of Playa de Oro, the Santiago river (500 feet wide) averages 300,000 miners' inches of water of 2160 cubic feet each in 24 hours, or 7500 cubic feet per second. The water for the mines will be taken from a branch of the Santiago (Rio Francklyn) at a sufficient elevation to give a large head. The elevation of the river at the point where the initial canal will be built is 330 feet above bedrock at the placers. Engineer Lord says that the canal from the Rio Francklyn should have a capacity of 6000 miners' inches of 2160 cubic feet per 24 hours, or 97,000,000 gallons. It is estimated that with a four per cent grade for sluices, one miners' inch of water will wash four yards of gravel in 24 hours. Six thousand miners' inches, at four cubic yards each, will wash 24,000 cubic yards in 24 hours. At the average value of 38 cents per cubic yard the maximum result of 24 hours' hydraulicking would be over $10,000. The result could be increased to any extent by the employment of more giants, the supply being practically unlimited.

The extent of the gravel beds is prodigious. The property covers about 60 square miles, and it is roughly estimated that there are about 1,600,000,000 cubic yards of gravel between bedrock and the grass roots. If there is an average gold value of 38 cents per cubic yard, the value of the deposit is $600,000,000! It is thought that several million dollars per year can be secured if the banks are worked at the capacity of the hydraulic appliances proposed to be put in. These figures stagger belief, but they seem to be justified. It is estimated that gold can be secured at an average of three cents per cubic yard. There will be no trouble about the disposal of the debris. There are on the ground, or purchased and about to be shipped, six miles of iron piping and four giants. One of these latter is 9 inch, which indicates pretty clearly that the company propose to wash out a great deal of gravel.

The company has conducted its operations from New York, largely through San Francisco. Last February the schooner Nora Harkins left this port for Ecuador, having on board twenty miners, mechanics, machinists, etc., recruited in this State by Mr. Eaton, the agent of the company in this city, and $75,000 worth of machinery, hardware, iron pipe, stores, etc., etc., purchased here. Later the steamer Alice Blanchard was chartered to carry a second installment of machinery and supplies ($50,000 worth), but the vessel, while on her way from Puget sound, went ashore at the entrance of Yaquina bay, and was detained nearly three months. The long delay of the steamer and some other matters not necessary to recite in detail, caused a change in the company's plans, and litigation arose. In connection with this matter and with the employment of California miners, pipemen and others, publications have recently been made which not only place the company in a false light, but which were not justified and were untrue. One of the machinists, John George, who went to Equador in February in the employ of the Playa de Oro Mining Company, returned in August, and, in an interview in a Grass Valley paper, reprinted in this paper, August 26, with proper credit, gave what purported to be his experience in Ecuador and seriously reflected upon the company — which, however, was not mentioned by name. The MINING AND SCIENTIFIC PRESS has investigated his charges, so far as they concern the relations of the company with San Francisco and San Francisco business men, and finds them wholly unfounded. The company has purchased about $125,000 worth of machinery, pipe, stores, etc., etc., here, and has paid cash in every instance. Without exception, business houses with which the company has had dealings refer to it in the highest terms. George made other statements about the company's payments to the men which we are also fully satisfied were not justified. Contracts were made with the Californians before they went to Equador for one year, as to the character of work, cost of provisions, manner of payment, etc., etc. They appear to have been carried out to the letter. The men were paid from the time they left San Francisco, and in other ways their welfare was looked after by the company in a most generous and considerate manner.

It is designed to ship the stores and appliances still remaining in this city at a very early date. The misfortune of the Alice Blanchard, and the recent financial crisis, have been chief causes of the delay; but the company is now in shape to go ahead with its project. The work of preparation for development has meanwhile been going steadily forward in Equador. The total cost of the company's outfit will be $275,000, including all preliminary expenses.

The attitude of the Ecuadorean government toward the enterprise was shown by the recent action of the local Congress in making a law exempting the Playa de Oro and certain other mining properties from all manner of taxation—State, municipal, export, or import—for 25 years. In addition, all mining machinery and material are admitted into the country free of duty. These most liberal laws were enacted with the view especially to encourage the development of the Playa de Oro and two other properties, of similar titles, in the province of Esmeraldas.

Limitations of the Gold Stamp Mill.

[Paper read by T. A. Rickard, of Denver, Colo., before the American Institute of Mining Engineers, August, 1893.]

IN TWO PARTS—PART II.

We have glanced at the results produced by the turn of the stamp upon the ore. Upon the mechanism itself the results are beneficial. The revolution of the stamp equalizes the wear upon the shoes and dies. It tends, also, by maintaining an even crushing surface, to prevent that decrease of efficiency which occurs when either hammer or anvil has an irregular face.

Water is the vehicle used for the removal of the valueless portions of the ore from those which are valuable. Its low specific gravity, as compared to both the metal and its enclosing gangue, enables us to use it as a medium for their separation. A liquid having a specific gravity greater than that of water, and intermediate between that of the gold and its gangue, would be more effective if its use were practicable, which it is not.

In the mill, however, specific gravity is not the only factor we have to consider. The water discharged from a stamp-mill often transports the heavy pyrites farther than the light quartz. This is due to the fact, already referred to, that the pyrite remains inside the mortar longer than the quartz and becomes pulverized to a further degree of fineness. It therefore presents a larger surface to the water. Again, the metallic sulphides commonly occurring in gold ores have a cleavage more highly developed than that of quartz; therefore, while the latter finds its way into the water in irregular and angular grains, the former will be found in thin plates and flakes, which readily float upon a running stream.

Water is the fluid used, but air also plays its part. During the time of its violent agitation under the falling stamp the water entangles a certain amount of air. Such air exists in the form of small bubbles, which hold the finely-pulverized ore in suspension and thus become the main agent in the floating of the slimes. Warmth causes the air to expand and the bubbles to become dissipated; therefore any rise in the temperature of the water, such, even, as is caused by the impact between the stamps and the ore upon the die, is favorable to a diminution in the amount of slime.

When the pulp is discharged from the mortar-box it runs down copper plates covering long, sloping tables. The copper, whether plain or silver-plated, is provided with an amalgamated surface, and it is this amalgamated surface which is supposed to do the work of arresting the gold. Mercury unites with gold, forming a heavy amalgam; but, in practice, it is found that a plate which is covered with a good coating of gold amalgam will serve to arrest gold much more effectually than a clean surface of either amalgamated silver or copper.

The amalgamating tables have a slope varying with the amount of water used, the heaviness of the pulp and the rapidity of the crushing. A gradient of seven-eighths inch per foot is common in Australia, while in Colorado the inclination is over two inches per foot. The colonial mills consume five gallons of water per stamp per minute, while those of Colorado use less than two gallons. Theoretically, the use of the least possible quantity of water, and the spreading of the pulp over the largest possible surface, will give the best separation of the gold from the gangue. In practice, the varying composition of the ore prevents a nice adjustment of the conditions. You may readily determine an inclination which will be most effective in causing a separation of the gold from the quartz, but it may be such as to cause the pyrite to settle. On the other hand, the slope may be so adjusted that the pyrite is carried away; but such conditions may then be obtained as will also permit of the escape of the gold.

The amalgamating tables are attached to the framework of the mill. The vibration set up by the falling stamps causes a pulsation of the water flowing over the plates similar, in a way, to the action of a jig. This assists the work of gravitation. The vibration has, however, another effect, namely, that of crystallizing the iron of the working parts of the mill, making them brittle and decreasing their time of surface. In this, as in other respects, the stamp-mill presents contradictory features.

At the outset, we described milling as the art of treating an ore so as to extract the maximum of value at the minimum of expense. Let us apply the description to the two types of mill to which particular reference has been made. In Colorado a stamp crushes one ton of the ore of the Gilpin county mines in 24 hours, and the cost, using free water-power, is 70 cents. In California the best equipped large mills crush at the rate of rather more than 2½ tons at a cost, also using free water-power, of about 35 cents per ton. The extraction in both regions will be, by amalgamation alone, about 70 per cent. We will omit the amount extracted by the concentration of any valuable pyrite, because the percentage of such material is very variable, and it forms a by-product, the value of which depends largely upon local conditions.

The ore of the Gilpin county mines carries about 15 per cent of pyrite and other heavy sulphides. The gangue is more feldspathic than quartzose, and is the product of the alteration of the country rock—granitoid gneiss—and of the dikes which penetrate it. The gold is not only present in a state of very fine subdivision, but it is also intimately associated with the pyrite.

On the other hand, the mill-stuff treated in Amador, Calaveras and Tuolumne carries from one to two per cent of pyrite. The gangue is quartz, but the ore also contains a very large proportion of the country rock, which in this case is slate, augite schist and diabase. Of these, slate predominates. The gold is coarser than that of the Colorado ore, and it is not so closely associated with the pyrite.

Let us now consider the results to be obtained by an interchange of treatment, using California batteries on Colorado ore and *vice versa*. The Gilpin county ore is of medium grade, say 8 dwts., or $8 per ton. The local methods extract $5 60 at a cost of 70 cents. A California mill would give an extraction of only $4, but would crush such soft ore fully three times as fast, so that the cost would be say 25 cents, giving a net yield of $3 75 as against $4.90 obtained by the methods of the district. Here, the slower mill gives the best results with a particular ore, and the Colorado millman considers the Californian very stupid because he does not use Colorado methods. Let us go to California and use the Gilpin county mill upon an ore of simpler character and of lower tenor. We will consider the treatment of an ore containing 6 dwts., or worth $6 per ton. The California mill would extract 70 per cent at a cost of 35 cents, leaving a balance of $3.95 per ton. The Colorado battery would extract an increased percentage, say 75 per cent; but the ore being much harder than that of Gilpin county, the crushing capacity would be less and the cost per ton greater than when treating Gilpin county ore, say, therefore, $1 per ton, leaving a net yield of $3.50 per ton. The California mill, if crushing 100 tons of ore per day, would therefore show a profit of $45 per day greater than that of the Colorado mill. As a matter of fact, there are other practical considerations which would render inadvisable the interchange of methods, among which may be mentioned the smaller size of the ore-bodies of Gilpin as compared to those of California; while it must also be remembered that the construction of a Colorado mill of a capacity equal to that of a California plant would require twice as much capital.

The comparison just made will serve as an illustration of the fact that milling is a business for getting money, and not a scientific pursuit directed to the obtaining of a perfect metallurgical treatment.

The contrast between the methods in use in two mining districts in the same country, illustrates the first axiom of all successful ore-reduction, namely, that the treatment must be suited to the character of the ore. Colorado methods in California would probably fail just as surely as California ways have been unsuccessful in Gilpin county. This is a truism not always remembered by machinery firms, who do not desire to be bothered by the making of new patterns. Too often, the ore is required to bend to a certain treatment in a mill of a particular design, instead of the mill being modified to suit the necessities of a particular ore.

The stamp-mill has presented to us many contradictory features. It is seen to be compounded of good and ill. It may be simple, but it is clumsy; it may be crude, but it is effective. As a machine, it has undergone an evolution common to all human inventions. It was founded on the first stone implement of the prehistoric savage; it became modified into the *matate* of the Mexican and the tilt-hammer of the Chinese; it progressed until running water was called in to aid human muscle, and, in the machine of the Hungarian peasant, it reached the primitive type from which our present mills were evolved. How great has been the comparatively recent improvement can be seen by stepping from Hungary to California.

In the valleys around Verospotak, in Transylvania, the larger mills consist of twelve stamps, in coffers holding four each. The power is derived from an overshot water-wheel 10 feet in diameter. The cam-shaft is of iron, and revolves on agate bearings, lubricated with water. The lifter, or cam, is iron-shod. The stamp weighs 250 pounds,

and has an agate head. The stem, the coffer, and all the rest, are made of beechwood. Each stamp drops 30 times per minute, and crushes about 300 pounds of soft ore per 24 hours. These machines have changed but little since the time of the Roman occupation under Trajan, when this district was a part of the province of Dacia.

Let us now go to California, whose record is little more than the record of a generation. Among the foothills of the Sierra Nevada we find mills containing 80 stamps, weighing 750 to 850 pounds each, and dropping 95 times per minute. Those of the working parts which are not of iron are made of steel. At single mills, 200 tons of ore are crushed per day. The mill building has a height of 70 feet, and the ore is never touched by manual labor from the moment that it arrives at the top in the mine-cars to the time when it is discharged at the bottom as waste.

In Transylvania, the individual shareholder often has his own mill; in California a thousand unite to operate one, which can, in 24 hours, treat as much ore as the Hungarian mill crushes in 100 days. The little machine of the Hungarian has been tapping away like a woodpecker for 18 centuries, and yet has not produced as much gold as has been contributed in the brief time of one generation by that completer mechanism whose muffled thunder echoes among the canyons of California.

What has been done may serve as a measure of what can yet be done. Perfection is as unattainable in milling as in any other branch of industrial art; otherwise progress were soon ended. We can compare the old mill with the new, not only with a complacent satisfaction at the advance that has been made, but with the consciousness that where so much improvement was possible, much room for improvement must remain.

It is not for me to attempt to foretell what place the stamp mill is destined to hold in the metallurgy of the future. Let me, however, in concluding, suggest the reflection that though the appliances of to-day may show a great advance upon the older more imperfect type from which they were evolved, yet there is no mining district that possesses a mill which cannot, in some essential, be improved upon.

How to Build Good Roads.

IN TWO PARTS—PART I.

[The following paper on how to build good roads, and what are the best and most economic roads, was written for the late California Road Convention by W. E. McClintock, C. E., of the Massachusetts Highway Commission.]

It would be of little use to one who has gained his experience in the study and manipulation of the roads of Massachusetts to attempt even an outline of the necessary policy to be pursued in the management of California roads. There are, however, some few general principles that must be borne in mind and which will apply equally well to any location.

It must be remembered at the outset that the weather is a very important factor among the numerous agencies which are constantly at work tending to destroy a road. By far the greatest wear of an ordinary country road is from the falling rains, the strong, dry winds, or the expanding and contracting influence of frost.

The effect of the rain is twofold: First, it washes the surface; second, it passes to the foundation.

The surface wash is of three kinds, viz.: First, by the water accumulating in the side gutters. These are made so deep and wide as to encroach on the roadway, when they become dangerous. Second, by flowing from the center of the roadway to the gutters, channels are formed which gradually become a source of annoyance and soon render the way unsafe. Third, by following small wheel-ruts on a falling grade the center of the roadway is slowly but surely made the gutter, and is thus destroyed.

The rain water reaches the foundation of a roadway either by passing directly through the surface, if it be loose and porous, or by soaking in from the sides. In making a study of the effects of water on a roadway, it is well to bear the above facts in mind, and then determine what action is necessary to prevent waste and destruction.

In this connection we find that the two essential features of a perfect road are a porous foundation and non-porous surface.

With a porous foundation all water will quickly pass downward; none will stand to soften the ground and the frost can do but little harm to the roadway if it be free of water. Underground water which flows toward the road will be powerless to harm it, if its foundation is porous, so as to permit the same to pass downward, or if it is intercepted by a drain or drains and thus carried to some convenient water course. If the road traverses a sandy or gravelly location, no precaution need be taken to secure a drainage of the foundation, as nature has already furnished it. On such a soil we shall need no heavy stone, no extra depth of any kind of stone, and no drains. If the natural soil over which the road is laid out be clayey or loamy and impervious to water, then we must take those precautions which will furnish an artificial porous foundation. If the road be on a hill-side, a drain constructed on the uphill side will prevent any water from passing underneath it.

If the road traverses level ground, one drain on each side must be built; or instead of these, one in the center, with a slope of the impervious material toward the center from both sides, the proper crown being made by the top covering. The drains may be built of rough stone, laid in the bottom of a trench from two and a half to three feet deep, or of common tile or vitrified pipe with open joints. Small stone or fairly good-sized gravel stone should be filled in over the drain to the top of the trench. The drain must lead to a water-course or to the surface of the ground at a point where it can readily flow away; otherwise the water will pass to the lowest point of the road and there stand until it so softens the foundation as to render it unable to bear up the traffic. Open side ditches will accomplish the same results as the drains, and if the road be through a farming country, or, in fact, any section where the open ditch will not be an objection, it can be built for far less money, and may, on the ground of economy, be adopted. If the natural soil be heavy clay it may be necessary to put in a center drain, or to place coarse stone carefully under the whole width of it, so as to permit the water to easily pass to the side ditches or center ditch, whichever may be used. Our motto at this point should be, keep all water from the road foundation.

We will now pass to the effects of rain falling on the surface. If the wash of the gutters be great, the only remedy will be to pave them with any kind of rough stone which may be most conveniently obtained. Such a pavement is comparatively inexpensive, and will save enough to more than pay for it. At times the water may be removed in the grass gutters, with no expense for pavement. If possible, the growth of grass should be encouraged at the sides of the road and the gutter made rather broad and flat, as by such an arrangement the water will be spread out more and its velocity be greatly reduced, thus preventing washouts.

We have already discussed the question of how to keep the water out of a foundation when it flows toward it from the sides. We will now treat of that part of the rain which falls directly onto the road.

It is well to bear in mind that too much water passing over the surface washes away the finer material which bonds the coarser and holds it firmly in place. By passing through the surface it reaches the foundation and softens it, so as to render it unable to bear up the load. We must consider the roadway itself as a roof which is to keep the water away from the foundation, exactly as the shingles on a roof prevent the ruin of the interior of the building. If the top surface be water-tight, we shall have a perfect road, as far as its ability to bear up a load is concerned. If we, at the same time, get a durable and smooth surface, we have got the most economical road we can build. If we are seeking a road which will be good during all seasons of the year, we must reject all material that is fibrous, or which absorbs water or does not let it flow off quickly. All loams and clays come under this class. They are good (if the traffic be light) when they are just moistened. During a long dry period they are all dust, and when it is wet there is nothing but mud. The fibrous nature of the material holds the water, and it evaporates instead of draining off. This is a slow process, and during the rainy season one evaporation is not completed before another wetting takes place, and we have a continuously muddy way.

The three materials which may be employed to obtain a water-tight roof are gravel, broken stone and pavement. The material to be used should be selected with reference to the volume and character of the traffic, and its applicaby the exposure and grade. When the cost of repairs on the cheaper material exceeds the interest on the excess of cost of the higher over the lower-cost work, then it is poor economy to retain the cheaper material and methods. This can only be determined by a study of the local conditions.

It is not our intention to touch on pavements, but we will discuss roads made of gravel and of broken stone. We have already said that the road must be a roof over the foundation. This roof has to serve the double purpose of keeping all water from the foundation and of affording a good smooth surface over which a loaded wagon can be hauled with the least expenditure of force. If a cubic foot of gravel be passed through screens of varying size of mesh, we shall find that what measured one cubic foot will have increased in size to a considerable extent. This will be even more perceptible if the finer screenings be placed at the bottom, with the coarser on top.

What we desire in a road is solidity, in order to get imperviousness. Whatever we do should be done with the end in view of placing our material in such a manner as to fill the void spaces in the coarse material as much as possible with the fine, and at the same time obtain an equality of hardness. If the gravel be dumped on a roadway from a cart just as it is taken from the bank, the coarser stone will roll to the outer edge of the heap while the finer will remain in the center. We thus get an uneven degree of texture, which will be more and more apparent as it begins to wear a little. A little labor expended in screening the gravel into say two grades will be of great benefit. If we first take out the larger stones, or what will not pass through a one-inch screen, we will get a better, because a more even, mixture. The larger stone will be arranged together, and furnish a solid foundation, while the finer gravel will simply fill the void in the coarse and bind the mass together. If this can be firmly rolled it will make a much better road than will the natural unscreened gravel, and at a price but very little greater. It must be remembered that sand is not gravel. Sharp sand cannot be made into a road. The more of such material to be found in any gravel the poorer is such gravel for road-building purposes.

Probably the best gravel for road-building purposes is the "blue gravel," which is made up of angular fragments of stone of varying sizes and a fine stone dust, with a slight quantity of clay, in the shape of fine powder. If the larger stones be removed entirely, and a little care be exercised in laying on the remainder, this makes a splendid road for all kinds of light travel and even a moderate amount of heavy. This gravel is found in banks which are very hard to work, and it is somewhat expensive to pick out and remove the larger stone. Of the rounded, water-washed gravel, that which has an excess of quartz in any shape is less valuable, as it is very brittle, and at the same time has no good bond. A slaty gravel makes a firmer and smoother road than the harder quartz, as there will be sufficient powder made by the action of the wheels to at all times give a good bond to the whole mass and make a smooth surface.

The main point to remember about gravel is to place the material in layers, with the fragments of each layer as near the same size as possible, the coarsest at the bottom, and bind them with the finer stuff placed on top. If this cannot be rolled, it should be carefully watched as it begins to compact, and all ruts at once filled, either by men with rakes or shovels, or by the use of a road-scraper. If the gravel ever compacts with hollows or ruts in the surface, it will be a very difficult matter to fill them so as to have a good, even road. The extra cost of this raking and leveling is but slight, while its effect is to give a smoother and more durable roadway. It is better policy to build less and to have it right than to cover a long stretch and have none of it good.

There are but few gravels which will make a good road. But, by careful manipulation, a comparatively poor gravel can be made to give fairly satisfactory results.

A Trip in the Yukon.

Some of the troubles that beset the miner in Alaska, or, rather, in the Yukon country, are thus set forth in a letter from E. A. Sather to Mr. Miller, at Juneau:

"I did not come back from the Yukon via Juneau as I intended, but went out to St. Michael on the steamer Arctic. My experience in the Yukon was not very lovely, but averaged with other inexperienced miners. As you know, I left your place the 9th of last April on the Chilcat, and crossed the summit on the 18th of the same month. Although the weather was favorable, we were snowblind and sorefaced when we reached Lake Bennett, and pulled down to Caribou crossing, where we camped and built our boats. After building our boats we had a good time hunting and fishing while waiting for the ice to break. The 30th of May we broke through the ice on Takau lake and went down the river as fast as we could get ahead. There were about 20 boats behind us. We had good luck until we had passed the White Horse, where we got stuck on the rocks and upset our boat. We lost some cooking apparatus, but saved most of our other stuff. We reached Forty Mile the 14th of June and went up to Franklin gulch, where the miners waited for rain; they had a dry season and did not make much. Miller and Davis creeks were very little better. Four or five claims in Miller creek pay very well, but the rest of them cannot scratch their grub stake. I did not work more than four days raking on the bars on Forty-Mile creek and made from $3 to $5 per day; then I got sick and had to pull out for St. Michael on the steamer Arctic which cost $30, and from there to Unalaska for $35, thence to San Francisco, $50.

"As a rule, the diggings in the Yukon are very low and will not average more than a bare living. I think there will be all of a hundred men coming out this fall, some over the summit and others down by St. Michael. Henkuk river is now the mining place; good diggings there. Mr. Bettles has started a trading post 600 miles up the river, but the diggings are 250 miles farther up still."

Founded by Mathew Carey, 1785.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1890.

This rare book on the treatment of gold and silver ore without quicksilver is nerally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 168 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cloth, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

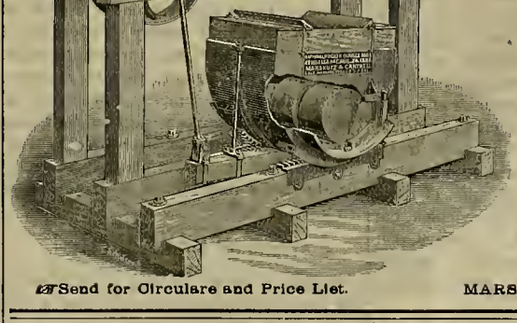
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

MINING AND SCIENTIFIC PRESS.
The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts Illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

PRACTICAL TREATISE ON HYDRAULIC MINING.

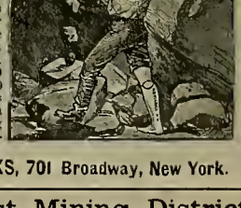
BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

ARTIFICIAL LEGS AND ARMS
WITH RUBBER FEET AND HANDS.

It is not unusual to see an engineer with hand on the throttle, or a conductor, brakeman, fireman, carpenter, mason, miner, in fact men of every vocation, wearing one or two artificial legs with rubber feet, Marks' Patents, and performing as much labor as men in possession of all their natural members.

Over 14,000 artificial limbs of Marks' Patents in use. Purchased by the U. S. and many foreign governments. One-half of the limbs furnished by us are made from measurements without our seeing the wearers. Fit guaranteed. A treatise of 430 pages, with 250 illustrations and a formula for measuring sent free. Address,



A. A. MARKS, 701 Broadway, New York.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is **THE TIDINGS.**

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6.00 a year; WEEKLY, $2.50, *in advance.*

Mechanical Progress.

The Paige Compositor.

It is claimed for the new Paige Compositor, a type-setting machine, that it does the entire work of composition, setting ordinary movable type with far greater speed, accuracy and artistic effect than has yet been accomplished by any method. The machine automatically distributes and at the same time sets the type indicated by the operator, automatically spaces and justifies the matter without mental effort on the part of the operator, places it in a galley ready for book or newspaper, as desired, records the number of lines set, and "leads" the matter when required. All of this is accomplished by means of positive mechanism. In an apprenticeship of less than 40 days, it is said, an operator has set 86,515 "ems" of solid, standard nonpareil in eight hours, an average of 8515 "ems" an hour. These figures are wonderful when one takes into consideration the fact that the average printer of to-day sets about 700 or 800 "ems" an hour, with his time of distribution also considered. The machine, as has already been said, distributes its type while it is also setting. The machine is run by one-twelfth horse-power, and is now in private practical operation.

"I can print," says Mr. Paige, "a 200-page book, at a cost of $5, in 20 minutes. The operator has only to watch the keyboard and copy, and the machine will do the rest. An operator can average three or four characters at each touch of the keys, and this machine is the only one in the world for which there is no excuse for an error in proof."

The Sun Furnace.

Sir Henry Bessemer's sun furnace, says *Industries and Iron*, is an erection which was possibly well-nigh revolutionizing the world, let alone the science of metallurgy. It was to attain a temperature of nearly 60,000°, and therefore fuse anything and everything; and I was assured that it would have achieved its object but for the stupid fault of an Essex lens-maker. The "sun furnace" consists of a wooden building 35 feet high and some 12 feet square. A few feet from the ground a large inclinable mirror for catching the rays of the sun is fixed; the rays are reflected from this mirror on to a number of powerful superimposed lenses above, which, by a simple arrangement, were to throw the enormously concentrated rays upon whatever object might be in the crucible below. Such was the mighty plan, but the manufacturer of the upper glasses, instead of turning them out uniform, made them all differeot, and thus the focus was spoiled. The work and anxiety in connection with this sun furnace was so great that its deviser did not care to go over the ground again, and there the peculiar furnace remains—a remarkable monument of what might have been.

Welded Seams in Plates.

In concluding an interesting paper on "Welded Seams in Plates," before the recent engineering congress at Chicago, in the marine and naval engioeering division, Warren E. Hill, vice-president of the Continental Iron Works, said: In the opinion of the writer, the time is not far distant when the shells of boilers or vessels, similar to those used by our transatlantic steamers and our United States Government cruisers, will all be constructed without the use of rivets or calking. Thus the full advaotages of the method may be realized, because, as can be easily proven, the welded portions of the structure are of the same value in tensile strength as any other portion of the material of which the vessel or boiler is constructed. When welded boilers come into more common use, and experience shall overcome the prejudices which to some degree obtain against them, then steam boiler shells may be lightened in proportion to the difference which common practice now allows as against boilers having riveted joints, for, aside from the weakness of riveted joints, and even with metal of the same thickness as required for riveted work, the weight of butt straps and rivets will be dispensed with.

A New Bearing.

A new bearing which has been introduced lately, to a considerable extent, in foreign engineering construction, is formed of a plumbago, or graphite, mixed with a certain quantity of steatite, a combination by means of which the soft plumbago is hardened so that it may be moulded into any desired shape, and turned or worked to fit any kind of a box. As described in *Machinery*, this mixture, which is compressed by a hydraulic press, and afterward baked, is slightly heavier than carbon, but much more tough, and is said to be adapted for use under heavy shocks, and the advantages of thus doing away with oiled bearings, in many instances, are declared to be so great that some loss of power in securing them is amply compensated for. Special account is made of the fact that the co-efficient of dry bearings is practically constant, and the friction can be allowed for in designing the motive-power to run the machinery, whereas the friction in a lubricated bearing varies according to the quality of the lubricant and the attention paid to oiling. Bearings made of lignumvitæ seldom last long without requiring to he renewed.

A Cheap and Effective Projectile.

Press dispatches from Washington City, Sept. 26th, state that a solid projectile, fired through 17 inches of steel armor plate at the Government proving station at Indian Head, came out unharmed. It is considered by officials of the Naval Ordnance Bureau the most satisfactory test yet made.

The projectile was impelled with a velocity of 1800 feet, and with a striking energy of over 12,000 tons. It not only passed through the heavy steel plate, but two inches of wrought-iron backing. The different shells and projectiles tested were those for 6, 8 and 12-inch rifles. The shells made of the Holtzer and Carpenter type are very expensive, and the department determined to secure, if possible, a cast-steel shot instead of the forged-steel pojectiles now made.

One year ago a contract was made with a New York firm for 400 10-inch and 100 12-inch cast-steel shot, and the acceptance of the test of some of them seems to prove that the navy has found a cheap as well as an effective projectile.

Edison on Flying Machines.

Once I placed an aerial motor on a pair of Fairbank's scales and set it going, says Thomas A. Edison. It lightened the scales, but it didn't fly. Another time I rigged up an umbrella-like disk of shutters and connected it with a rapid piston in a perpendicular cylinder. These shutters would open and shut. If I could have gotten sufficient speed, say a mile a second, the inertia or resistence of the air would have been as great as steel, and the quick operation of these shutters would have driven the machine, but I couldn't get the speed. I believe that before the airship men succeed they will have to do away with the buoyancy chamber.

New Material for Cog Wheels.

A process has been discovered by a German mechanic for producing, through the combination of rawhide and a composition of his own, a new material adapted to the manufacture of "cog and friction wheels," which is considered likely to do away in many cases with iron and other metals, besides offering additional advantages. It is claimed that this new material not only insures the noiseless working of machinery, but also that teeth made from it are more durable than metal.

The Manufacture of Heavy Guns.

The manufacture of the immense guns required for modern service is a most interesting process, says *Machinery*. The rifled guns are made by re-enforcing the tube with rings and repeated layers of steel called pockets, which are fitted one over the other over the original tube or barrel of the gun. The exact size of the jacket and ring when heated so that it can be put in its place must be a matter of the nicest mathematical calculation. The powder makes such havoc with the rifling of the largest guns that 100 charges are about all that can be expected from them. The jackets and rings can then be removed and fitted to another tube. The various parts of the gun are not put together at the foundry, but are sent to a department of the arsenal called the assembling room, where the tube is rifled, and the gun is finally completed. A steel gun of the largest calibre costs about $90,000 to $100,000.

New Abrasive Material.

Carborundum is a new abrasive material placed in the market for the various uses to which emery, or corundum, is applied. It is a definite compound, atom for atom, of carbon and silicon; a true silicide of carbon or a carbide of silicon. The name carbo-silicon would have been more scientific and appropriate. The appearance and properties of this substance are more nearly those of the diamond than of corundum, the luster being highly vitreons and adamantine, and the hardness being extreme, sufficient in the form of a rapidly-rotating wheel to cut the hardest steel and corundum crystals, and the material is said to have been used with success in polishing diamonds.

Not "Monkey Wrench."

Many persons wonder why the monkey wrench received such a name and imagine it must have a connection io some remote way with the animal from which its curious designation seems to be derived. In fact, its name is not monkey wrench at all, this being a corruption of the title originally given it.

It was invented by Charles Moncky of Willlamsburg, N. Y., who sold his patent to a firm who undertook to manufacture and put it on the market. In honor of the inventor they called it Monck's wrench, but both they and he were soon much disgusted to find it known as a monkey wrench.

Signalling by Light.

A new apparatus termed the telephote intended for signaling at sea by night has been brought out by an engineer resident at Vienna. There is an aluminum mast from 10 to 30 feet high, a battery or dynamo, a cable of electric wire, and a transmitter keyboard of 37 keys. On the mast are arranged 106 incandescent lamps, which can be manipulated to form the signs of the Morse alphabet. Seventy-two letters a minute, it is stated, can be shown on the telephote, clearly visible three miles in daylight and ten miles at night.

Aluminum for Piano Plates.

It seems probable that the piano plates of the future will be largely composed of aluminum or of aluminum alloys. The present plates are, in many respects, admitedly deficient. Insensibility to vibration and heaviness and density required in the casting for the attainment of a certain tensile strength, as compared with aluminum, are obvious drawbacks which platemen and piano-manufacturers hitherto apparently looked upon as conditions from which that branch of foundry work was inseparable.

Scientific Progress.

Submarine Photography.

Several of the difficulties experienced in endeavors to ascertain the natural relations of objects existing at considerable depths under water have been overcome by M. Louis Boutan, in a remarkably ingenious manner, and the contrivances he adopted are described in a recent communication to the Paris Academy of Sciences, writes John Humphrey of London to *Science*.

He prefers to use a small camera in which several plates can be exposed consecutively, and encloses this in a rectangular, water-tight metal box, into the sides of which plates of glass are inserted to serve as windows. The camera can be so disposed that the lens may face all the windows in turn, if desired, and exposures are regulated from outside the metal case. To avoid any ill effects that might be caused by differences in the internal and external pressure when the apparatus in sunk io deep water, a kind of balloon filled with air is connected with it. As the pressure increases, in descending, the balloon is compressed, extra air is thus forced into the box, and the pressure on its wall equalized. A stout foot to support the apparatus and weights to sink it complete it for practical purposes.

In water near the shore, not greatly exceeding one meter in depth, the apparatus can be conveniently fixed, without the operator needing to enter the water, and, by direct sunlight, good negatives can be obtained in ten minutes. When the water is deeper the operator must descend in diving costume to fix the case securely on its stand before commencing the actual work of photography. In calm, bright weather, photographs can then be obtained by direct sunlight in from 30 to 50 minutes. Colored glasses, preferably blue, must be interposed between the objective and the water, in order to obtain sharp images.

By the use of artificial light to illuminate the surroundings, however, matters are still more simplified. To this end, M. Boutan has contrived a special magnesium lamp. A cask of 200 litres capacity is filled with oxygen gas, and on its upper end is fixed a spirit lamp, which is covered by a bell glass. A vessel containiog magoesium, in powder, is connected with this lamp in such a manner that the metal can be projected across the flame by the action of a rubber ball which serves as bellows. The oxygen gas, of course, is intended to assist combustion, and the lamp having been lighted and covered by its protecting globe, the cask simply reqnires weighting to sink it.

Good instantaneous negatives have thus been obtained by M. Boutan during a violent storm, when no daylight could penetrate the depths. They are lacking, as regards background, but this he attributes to imperfections in the apparatus, particularly the objective. He also found it necessary to place before the lens a diaphragm of very small aperture to secure a sufficient degree of sharpness. If a formula were calculated for an objective, the front of which might be exposed to sea water, he thinks these drawbacks might be remedied.

As it is, he has proved that photographs can be taken in a brief time uoder water, in calm weather, by direct suolight, at depths up to six or seven meters; whilst, by the use of his special lamp, they can be taken, instantaneously, at any depth that can be conveniently reached by a diver, and the state of the weather is of no importance.

A New Lens.

Dr. Goerz of Berlin has iovented a new double anastigmat lens, which was recently described and showo by him before the Photographic Society of Great Britain. From its large aperture this leos is entitled to rank as an aplanat; it is free from astigmatism, and even with a large aperture it has a field

that is quite flat. These valuable properties should insure its success when it comes to be introduced commercially in this country, says the Chicago *Journal of Commerce*. Its great advantages can, we are told, only be fully appreciated by a comparison of its work with that of other lenses formed of the Jena glass.

Mr. Edison's Coming Invention.

A correspondent of London *Machinery* has received the following interesting particulars from Mr. Thomas A. Edison: "I am at work on an invention which I may now say will be a success, and which, while its commercial value will be very limited, may recommend itself to my friends as something curious. It is not yet complete, but I am vain enough to believe it will surprise you. I hope to be able to combine the phonograph and the camera, and not only reproduce the sounds accompanying an event, but the actions of those taking part as well. For instance, if Madame Adelina Patti should be singing, this invention will put her full length picture upon canvas so that the expression of her face and the pose of her body can be seen while listening to the song she has sung. The eye will be pleased as well as the ear. The invention has demonstrated its practicability at a prize fight. I reproduced the ring, the two principals, the crowd about them, the intensely interested expressions of all, the sound of blows, the cheers of encouragement and the howls of disappointment. My idea is that a man, sitting in his library at home, may be able to see reproduced upon his wall the business of the stage as well as the lines of the actor.

The Deepest Sea-Sounding Again.

"The deepest sea-sounding on record" has again been made in the Pacific ocean, this time by the United States fishery steamer Albatross. Telegraphic advices from Victoria, B. C., September 23rd, say:

"The United States fishery steamer Albatross has had a very successful season. While in the neighborhood of Bering sea the scientists found time to materially investigate submarine life. She also made the deepest sounding ever made in the world. Tremendous weights attached to steel cables were lowered to a depth of 4500 fathoms, off the coast of the Alaskan peninsula. At a depth of 2800 fathoms in another place excellent specimens of phosphorus fish without eyes were secured. In all, sufficient fish and weeds to load four cars were taken."

As stated in this department on September 16th by John Partridge, Secretary of the Geological Society of the Pacific, in 1874 the U. S. S. Tuscarora, Capt. Belknap, while surveying for a cable bed, only about 100 miles off the coast of Japan, played out 4643 fathoms of wire (27,858 feet) without finding bottom; then the wire broke. In the same region bottom was afterward found at 4655 fathoms.

The Harvest Moon.

Most people know that the moon hastens her time of rising during the evenings of the harvest moon, but why this is so few have ever asked, says Orrin E. Harmon in the Seattle *Post Intelligencer*.

A complete mathematical explanation lies beond the limits of this article, but a simple illustration will explain the principle:

Take a rod five feet long and immerse it in a body of water whose surface is tranquil. When the top of the rod is just at the surface of the water draw the rod out of the water at the rate of one foot each second, keeping the rod in a vertical position. Clearly it will take five seconds to lift the rod out of the water.

Again place the rod in the water and so incline it that the lower end will be three feet below the surface of the water when the upper end is on a level with the surface. In this position raise the rod out of the water at the same rate as before, keeping the direction of motion vertical. With the rod so inclined it will take only three seconds to raise it ont of the water, and the time will be shortened in proportion as the rod is inclined to the surface of the water.

In this illustration the rod represents the position of the moon's path which she describes between two successive risings, and the water surface represents the plane of the horizon. If, then, we see the moon on the eastern horizon to-night, at the same time to-morrow night (the moon having advanced eastward) she will be below the horizon, and the time required for her to come to the horizon will depend upon her distance below the horizon, and this in turn will depend upon the inclination of her orbit to the horizon. This inclination is very changeable and depends upon, first, the latitude of the place; second, the place of the moon's nodes on the ecliptic; third, the inclination of the ecliptic to the horizon, which depends upon the time of the year as well as the time of day.

Degrees of Hardness.

The following table, by Prof. Prestwick, of the relative hardness of certain minerals is worth noting for reference:

Talc, laminated	1
Selenite	2
Mica	2 5
Calcite	3
Fluor spar	4
Quartz	7
Corundum (sapphire and ruby)	9
Diamond	10

QUICKSILVER

—FOR SALE BY—

The Eureka Company of San Francisco,

Rooom 1,

426 CALIFORNIA ST., SAN FRANCISCO.

HEALD'S

BUSINESS COLLEGE.

24 POST STREET.....SAN FRANCISCO.

FOR SEVENTY-FIVE DOLLARS

This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. SEND FOR CIRCULAR. E. P. HEALD, Pres. C. S. HALEY, Sec.

ACTUAL BUSINESS PRACTICE.

Established 1863 PACIFIC Business College, 320 POST ST. SAN FRANCISCO. Established 1863

LIFE SCHOLARSHIPS, $75.

Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. P. A. ROBINSON, Pres.

Practical Hydraulics.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco, Cal.

WHAT THE PRESS SAYS.

"A clear and comprehensive little treatise."—*N. Y. Sun.*

"Electric Science is making magnificent strides and this book fills a useful office in setting forth the features and characters of these advances."—*Brooklyn Times.*

"The need of such a book has undoubtedly been felt by many . . . we predict for it a splendid sale."—*The Age of Steel.*

"A book like this should be largely read."—*N. Y. Herald.*

"The book is well illustrated, and no pains have been spared to make it accurate and reliable throughout."—*Electrical Review.*

"In simple language, the author lays bare the secrets of electrical science and application."—*Electrical World.*

"A vast amount of useful importance."—*Washington Post.*

FROM THE LABORATORY OF THOS. A. EDISON,
ORANGE, N. J., Sept., 24, 1893.

DEAR SIR.—I have read the MS. of your "A B C of Electricity," and find that the statements you have made therein are correct. Your treatment of the subject, and arrangement of the matter, have impressed me favorably.

Yours truly,
THOS. A. EDISON.

Metallurgy and Ores.

SELBY

SMELTING AND LEAD CO.

416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY

—AND—

ASSAY OFFICE.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

—MANUFACTURERS OF—

BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.

—ALSO MANUFACTURERS OF—

Standard Shot - Gun Cartridges,

Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.Co BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.** Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

JULIUS H. STRIEDINGER, M. Am. Soc. C. E. OTTO von GELDERN, M. Am. Soc. C. E.

STRIEDINGER & VON GELDERN,

CIVIL AND MINING ENGINEERS, TECHNICAL EXPERTS, LICENSED SURVEYORS.

Hereby announce that they are prepared to make the Examinations, Surveys, Technical Drawings, Estimates and Reports required by the

CALIFORNIA DEBRIS COMMISSION,

Created by an Act of Congress, approved March 1, 1893, and to represent the petitioners before the Commission.

Address: 819 Market Street,

SAN FRANCISCO, CAL.

CLAYTON AIR COMPRESSORS

FOR ALL PURPOSES AND PRESSURES.

Complete Catalogue and Application.

CLAYTON AIR COMPRESSOR WORKS,

43 DEY ST. NEW YORK.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for pract cal men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER,

226 Market St., N. E. cor. Front (up stairs) San Francisco. Experimental machinery and all kinds of models. Tin. and brasswork. All communications STRICTLY CONFIDENTIAL.

Electricity.

Long-Distance Transmission.

The three phases of the application of electricity may be termed successively lighting, traction and long-distance transmission. The two first have been pretty thoroughly considered and applied, but the third is yet in an experimental stage. It is one of the most prominent questions that confronts the electric engineer to-day, and, though this phase of the problem is considered the simplest theoretically, it is likely to prove the most awkward practically. It is impossible in the present state of the science to prescribe either a direct, simple, alternating or multiphase current as a general solution of long-distance transmission, and it is not improbable that each of these systems will find application in various places, according to their individual requirements. Discussing this subject, *Electricity* says:

"The multiphase current, being the latest development, is at present attracting a monopoly of the attentions of electrical engineers, and at first sight the peculiar properties which it possesses make it specially adapted for both lighting and power, but multiphase motors are as yet comparatively new, and the test of time is needed, as well as a more extensive use, to determine the efficiency and practicability of multiphase systems. The simple alternating current, while giving a good efficiency, is handicapped for the want of a self-starting motor under load, which puts this system at a disadvantage for a general distributing plant. It has been successfully operated, however, in the case of mines and other places where a special starting device was used for the motors.

"The direct current system has been largely lost sight of in discussing long-distance transmission, but there are many engineers who believe that high-tension, direct-current machines will nevertheless play an important part in long-distance work. For large motors and street railway work the direct current is as yet almost indispensable, and there can be no question but that much higher working pressures than are now in general use are perfectly feasible. In an address by Prof. Crocker, he points out that raising the voltage of these machines to 5000 and even 10,000 volts is quite possible with sufficient care in the matter of insulation.

"The commutator is of course the great bugbear in machines of this sort, and in general the trouble at that point will prevent the use of a single machine of such a high voltage as would be required for a very long line, but connecting several machines in series would largely overcome this difficulty.

"In the matter of transformation the direct current is still at a disadvantage compared with the alternating, and it is obviously impossible to use a pressure of several thousand volts for the service of small consumers. For local distribution the use of direct current transformers would be imperative, but these dynamotors can be built to reach an efficiency of 90 per cent or more, and in this way a certain proportion of this current could be economically distributed for small customers.

"While the voltages mentioned seem at first sight to be impracticable, it must be remembered that in arc-light work 60 and 80 light machines are in general and successful use, generating from 3000 to 4000 volts, and, while in most places alternating and multiphase currents will perhaps be found the most practical, the advantages of a direct current for many kinds of work render its application to long-distance transmission worthy of more study and experiment than it has yet received."

Sealing Electrodes in Bulbs.

A novel application of electric welding is said to have been made with the result that wires of the base metals can be united to glass by fusion without previous oxidation, says the *Optician*. The tube in which the wire is to be fused is first made as small as possible. The wire is then inserted and the tube is exhausted of air. An electric current of gradually increasing strength is passed through the wire, and, as this heats up, the air occluded in it is evolved and drawn away. Finally the tube becomes softened, either by heat radiated from the wire or by the application of a blowpipe flame to its exterior. When this takes place the glass falls in upon the unoxidized surface of the metal. In practice the method of procedure has to be varied in different cases, but there is nothing that calls for further explanation to those who are skilled in the manipulation of glass.

Electricity at the Midwinter Fair.

One feature of the proposed Midwinter Fair in this city that will be particularly novel and pleasing will be an electric tower, which will rise in the center of the grand court to a height of 266 feet. At night it will be ablaze with the colored electric lights gleaming and ever changing in the darkness. The first and second floors will be for music. Elevators will be used, and visitors may ride in them to a height of 230 feet.

The tower is to be of iron. It is of interest to know that a local firm has received the contract to build it—J. K. Firth.

The great tower will be but a single feature of the electric illumination of the fair. The different electric-light companies who have established agencies in this city are already making arrangements to provide for the practical and ornamental illumination of the exposition.

In the matter of ornamental illumination, some startling effects are suggested. As the plan stands now, every building will be outlined in light. Electric globes of different colors will give a beautiful and striking effect. All of the main buildings, each of the concessions and every structure on the grounds will have its borders lit up by electric fires.

An electric fountain is planned. Luther Stierenger, the consulting engineer of the Columbian Exposition, will make the design. The electric fountain is to be elaborate in the extreme, and will have all that electricity can show in the way of light—fantastic, practical and ornamental.

An Ingenious Dynamo.

An ingenious dynamo has been invented for the purpose of facilitating the work of jewelers, bicyclers and students in plating, and experimenters and small platers will find it equally useful. The dynamo is a regular machine of high efficiency. It is cast on an iron pedestal with an arm extending for the support of the saddle and the hubs, in which the main bearing runs. The machine has a regulation bicycle saddle with spring adjustments and an adjustable saddle post, and either a child or the tallest man can, after mounting the saddle, operate the machinery by working the pedals after the manner of the ordinary cycle.

Electric Coal-Cutting.

Electric coal-cutters are now largely in use in the bituminous mines. In the machine most employed the coal is undercut by means of bits set in a rotary bar on the end of a sliding frame, which is fed into the face of the seam. Other cutters are constructed with a sprocket chain to the links of which are affixed cutting tools. Machines of this kind, says *Electricity*, can be fed either in or along the face of the coal for long-wall or room working. In both of these the electric motor is built into and forms part of the frame, adding but little to its weight. In exceedingly hard or pyritiferous coals, which cannot be cut with a continuously moving cutter, an electric pick machine is advantageously used. This also has the advantage of giving a kerving wider at the front than at the back of the cut, which allows the coal to fall outward and more lump coal to be gained. The motor draws a projectile back against a spring, and, releasing it, lets the pick fly against the face of the coal at the rate of 150 blows a minute. Electric drills for putting in holes, for blowing down coal after it has been undercut or from the solid, as is done in anthracite, are also used. Mounted on a column a machine of this kind is free to drill in any direction from horizontal to vertical. A drill of this type, of 100 pounds weight, will easily drill a 1½-inch hole at the rate of six feet per minute in hard or soft coal.

Fishing by Electricity.

An apparatus for fishing by electricity has been introduced, consisting of a large iron frame interlaced with netting, which can be opened and closed at the will of the operator. An electric light encased in a lantern is lowered into the net, the electricity being furnished by a motor in the bow of the boat. As the boat moves along the network is thrown open, and the bright light of the lamp, which is seen at a great distance in the clear water, arouses the curiosity of the fish, which swim into the trap.

An Electric Captive Balloon.

One of the attractions at the International Exhibition in Antwerp next year will be a captive balloon, worked and lighted by electricity. It will be capable of accommodating 40 people and of rising to a height of 1500 feet. The balloon is the invention of a Belgian officer of engineers, and trials with it have proved so satisfactory that the ballooning corps of the Belgian army is constructing a similar one, but smaller, for military purposes.

Useful Information.

Hygienic Treatment of Sprains.

Sprains are so common that their treatment should be well understood. While all cases are not to be treated exactly alike, yet the general principles are the same in most instances, says the *Journal of Hygiene*. The method we can recommend as most efficacious is somewhat as follows:

The injured part or joint is immersed in very warm water as soon as may be after the injury, in order to dilate the superficial vessels for a few minutes. After this, massage should be practiced, above, below and around the injured part, then gradually approached and a very gentle stroking is applied to it. After that, a little more vigorous friction is practiced. Insensibility is thus gradually produced. When partially obtained, a more or less energetic *kneading* is practiced, according to the varying degree of sensibility experienced by the patient, but pain should not be caused. To the massaged part is finally applied a compressive bandage, with wadding, which is wrapped in a flannel or linen band. If the sprain occurs in the inferior limbs, the practice of avoiding movements for a shorter or longer period is not advised, but the patient may use his limb to walk as soon as he can do so without feeling great pain. Walking promotes the venal and the lymphatic circulations by the muscular contractions, but if much pain is caused it should not be long continued.

The Greater Intemperance.

We talk about temperance as though abstinence from alcohol were the fulfillment of the law, but there is a greater temperance yet to come, more in accordance with the dictates of an enlightened reason, says the *Journal of Hygiene*. There is more than one kind of intemperance, and a modicum of observation would show that disgraceful outward conduct by no means gives the full measure of danger that menaces society. The sin of overeating produces as much or more trouble to the community as that which comes from the use of alcoholic drinks. The use of tobacco is the occasion of harm second only to that of alcohol. The evil wrought by the excessive use of coffee is by no means one of the minor ones. The baneful effects of the coffee habit in Brazil are equal to that of the beer habit among the Germans. The use of opium and other narcotics is another fruitful source of injury to the community. The evils of overwork and worry do not fall far behind. In fact, we exhaust ourselves every day; in our work and in our play, in eating and drinking, and even in those athletic efforts that are supposed to be hygienic and recuperative. They are all made too intense, and therefore we do not live out more than half of our days, and that half we do not live either comfortably or with that fullness and richness of life which we might. Furthermore, these very excesses are the occasion for much of the demand for alcohol to drown the nervous rebellion that would otherwise shield us from the result of our own foolishness. In confirmation of this, look at the immense amount of disease that runs riot throughout our land.

Mental Kitchen Scales.

Ten common-sized eggs weigh one pound.

One pint of A coffee sugar weighs 12 ounces.

One pint of best brown sugar weighs 13 ounces.

Two teacups, level, of granulated sugar weighs one pound.

One and one-third pints of powdered sugar weighs one pound.

One pint, heaped, of granulated sugar weighs 14 ounces.

Two tablespoons of powdered sugar or flour weigh one ounce.

Two teacups of soft butter, well packed, weigh one pound.

One quart of sifted flour, well heaped, weighs one pound.

Four teaspoons are equal to one tablespoon.

Teaspoons vary in size and the new ones hold about twice as much as an old-fashioned spoon of 30 years ago. A medium-sized teaspoon contains about a drachm.

Miss Parloa says one generous pint of liquid, or one pint of finely-chopped meat, packed solidly, weighs one pound, which it would be very convenient to remember.

Influence of Climate on Race.

The Anglo-Saxon race is at present trying, on a magnificent scale, an experiment which has never been similarly tried before, viz., the capacity of a vigorous conquering and colonizing stock to extend itself through countries the most diverse in all the conditions that affect most powerfully health, vigor and reproductive faculty. But can a race that grew to its full stature among the marshes of the Baltic, the fiords of Norway and the humid hills and dales of Britain hope to retain that vigor on the sweltering plains of India or Australia or in the ice-bound wilds of Canada? Will a new type of Englishmen finally evolve itself in Florida, in New South Wales and in Bechuanaland? Will the Anglo-Saxon ever remain vigorous and fertile within the limits of the tropics? These are vast questions, on the answer to which great destinies hang, and we can hardly evade them any longer on the ground that no materials for a solution exist. Some materials, inadequate and incomplete no doubt, do exist and are constantly accumulating. Let us look at a few of the facts brought forward in the article before us.

The writer takes the case of Barbadoes, "the oldest and healthiest of our tropical possessions." There, he says, the observer

"will see some people known as the 'mean whites,' men and women of blood as pure as his own, whose progenitors have lost through poverty the luxuries and advantages which, with constant infusion of fresh blood, alone keep the whites alive there. He can notice at the same time the insolence which the consciousness of physical superiority has bred in the descendants of African slaves." As an example of a very opposite type, the writer takes New Zealand. After pointing out what is so constantly forgotten, that the position of New Zealand in the Southern Hemisphere corresponds rather to that of Italy than Great Britain in the Northern Hemisphere, he gives his opinion that in New Zealand "the people are undergoing a rapid process of alteration—are becoming, to coin a word, dis-Englished in respect of mental characteristics." They are losing the melancholy, restlessness and anxiety said to be characteristic of Englishmen, and are becoming cheerful and light-hearted, like the southern races of Europe. Further, by reason of the absence of a hard winter severe struggle with the elements, and through high wages and abundance of food, the New Zealander tends to become easy-going, pleasure-loving and optimistic.—Lancet.

Facts about Metals.

Spain is one of the principal copper-producing countries.

The tin production of the world in 1891 was 69,963 tons.

The annual production of gold and silver is about $200,000,000.

The United States produces 35 per cent of all the lead of the world.

Galena, or lead ore, always contains silver in greater or less quantities.

Copper is said to be found in over 16,000 localities in the United States.

In 1888 the United States produced 160,000 tons of lead; the world, 297,000.

By improvement in machinery, one man now raises more ore than four men could in 1800.

In 1889 the United States produced 103,000 tons of refined copper, nearly one-half of the world's yield.

About 60 per cent of the copper produced in this country comes from the Lake Superior region.

The United States produces 31.4 per cent of all the iron ore in the world and 34.1 of all the pig iron.

The world's coal fields already known and worked contain coal enough to last for a thousand years.

The "Longworthy crevice" near Duhuque has produced, it is said, nearly 10,000,000 pounds of lead ore.

The mines of the world produce every year 540,000,000 tons of ore, etc., of which the United States produces 160,000,000 tons.

The most important lead regions of the United States are in the Mississippi valley, one being a district in Wisconsin, Illinois and Iowa; the other in Missouri.

The United States leads the world in the production of iron, in 1890 producing 10,000,000 tons of ore and 9,202,703 tons of pig iron, Great Britain coming next with 13,000,000 and 7,904,000 tons respectively.

In the 88 years from 1800 to 1888 the world mined 7942 tons of gold, 95,559 of silver, 84,900,000 of copper, 34,600,000 of lead, 31,500,000 of zinc, 1,430,000 of tin, 1,273,000,000 of iron and 10,601,000,000 of coal.—Exchange.

Paper Bottles.

The paper-bottle works at Glassboro, N. J., have shut down, and it is rumored that operations will not be resumed. This establishment is the only one of its kind in America, and with the closing of the doors a unique industry will be abandoned, says the Philadelphia *Times*.

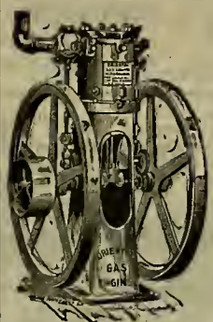
Paper bottles are comparatively a recent invention, and their market is limited principally to two-ounce ink bottles. They are largely used in export trade, where duties are levied according to gross weight, as they only weigh one-third as much as glass, and are non-breakable. The bottles are made by machinery, and but little labor is required in their manufacture.

A Chicago ink manufacturer began some years ago to experiment, first making wooden bottles and afterwards paper bottles lined with a water-proof composition. The present company secured the patent and set up an establishment to place the bottles on open market.

Use for Eucalyptus Leaves.

The Madras and South Indian Railway Companies have been making experiments with a decoction of eucalyptus leaves as a disencrustator for locomotive boilers. The experiments are said to have proved so highly satisfactory that further tests are now being made by the Madras Company with a view of practically utilizing this decoction.

THE ORIENTAL GAS ENGINE



IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

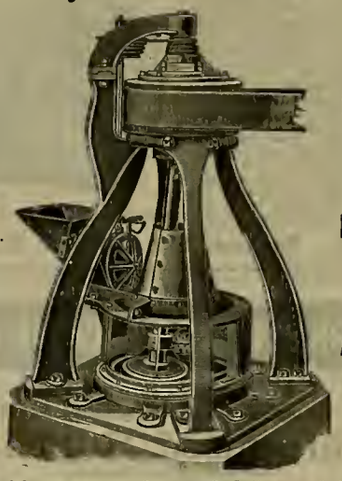
THE GRIFFIN MILL
The Only Perfect Pulverizer



OF QUARTZ, GOLD OR SILVER ORES, PLUMBAGO, PORTLAND CEMENT,

OF PHOSPHATE ROCK, FOUNDRY FACINGS, And All Other Refractory Substances.

Will work either wet or dry, and deliver a finished product. Capacity, 3 to 4 tons per hour on Phosphate Rock, 1½ to 2 tons per hour on Portland Cement, Quartz or Ores, depending on hardness of material to be pulverized and fineness of product. Grinds from 30 to 250 Mesh with equal facility.

NO JOURNALS IN GRINDING CHAMBER. BALL RIGID ON SHAFT HAVING DIRECT POSITIVE ACTION ON MATERIAL. MINIMUM POWER PRODUCES MAXIMUM AMOUNT OF PRODUCT. IT IS ABSOLUTELY GUARANTEED IN EVERY RESPECT, BOTH AS TO CONSTRUCTION AND CAPACITY. FIRST COST, WEAR, AND OPERATING EXPENSE MUCH LESS THAN STAMP MILLS. LARGE NUMBER OF MILLS IN USE ON DIFFERENT MATERIALS WITH POSITIVE SUCCESS IN EVERY INSTANCE.

Correspondence solicited, and illustrated descriptive pamphlet furnished on application to

Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will be honestly given.
DR. WILLIS E. EVERETTE, 1818 E. ST., Tacoma, State of Washington, U. S. A.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores,
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leeching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—JUST OUT.
Price $1.75.
This book is entitled "Assaying—Parts II and III," and is seperate from Part I, and treats of Gold and Silver Bullion Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

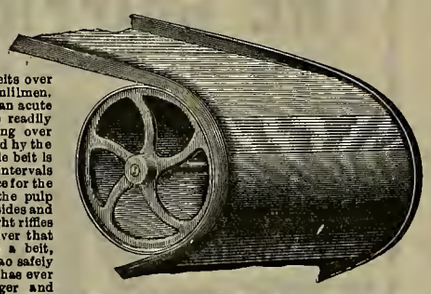
GAS WORK A SPECIALTY.

THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from hanking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

Coast Industrial Notes.

—The oew town of Hartford Junction, near Snohomish, Wash., has been wiped out hy fire.

—Herr Jenson, of Holstein, Germany, has hegun the manufacture of bricks in Whittier and is now turning out 25,000 daily.

—The bark Guteobeck cleared for Liverpool from Victoria, Saturday last, with the first salmon cargo of the season, consisting of abont 39,000 cases.

—Conoection has been made at Spokane with a loog-distance telephone, extending from Spokane to the Puget Sound cities via Portland. It is a complete success.

—The Imperial Clothiog Company, the largest establishment of its klnd ln Spokane, has gone ioto the hands of a receiver. The liabillties are $105,000 and the assets are much helow this figure.

—A fire in L. L. James' lumher yard at Napa occurred last Saturday. James & Co. estimate their loss at $20,000 to $25,000 and are insured for $10,000. Mr. Knapp lost about $5000, with no insurance.

—A fire hroke out at Turlock, Cal., Monday eveniog at 10 o'clock, destroying the business portion of the town. It took the whole hlock on Froot street, includiog the store of L. Stranss & Co. The loss is $50,000.

—Lawyer Cromwell, counsel for the receivers of the Northern Pacific, announces that they have not funds enough to justify them in meeting the interest on $19,328,000 6-per-cent second mortgage bonds, due October 1st, hut hope soon to he able to do so.

—The Duniway Lumher Company at Portland, Or., has made an assignment. The liabilities are $100,000; assets the same amount. A receiver will contioue the husiness. The failure was caused hy the continued depression of the lumher trade and the financial stringency.

—Senator Perkins, ln response to a telegram addressed to him by Mayor Carlson inquiring as to the mail-carrying contract of the South Pacific Coast, says: "Bell, the Assistant Postmaster-General, assures me that no change is proposed. The same number of calls will be made at San Diego as heretofore."

—Bids for constructing a ditch for the Escondido Irrigation District were opened last Monday. Citizens of the town have been giving individual subscriptions toward purchasing honds of the district, and about $20,000 has already heen secured, with which, it is hoped, some actual work may he accomplished by the district.

—Steps are about to he taken toward the construction of a fish ladder at the falls of the Willamette at Oregon City, Or., for which the last Legislature made an appropriation of $10,000. Governor Pennoyer and Treasurer Metzchan have made an investigation of the premises, in company with United States Fish Commissioner Marshall McDonald.

—After investigation hy the Navy Department of the action of the contractors of the Port Orchard drydock, set on foot hy the Stone Cutters' Union of Tacoma, Secretary Herhert has ordered hard sandstone or granite to he used in the dock instead of Tenino sandstone. This action of the department will cost the contractors about $50,000, it ls said.

—The Louis Landler planing mill burned in this city Tuesday night, entailing a loss of $30,000. It destroyed the engine-room, most of the mill and machinery, a large stock of moldings and casings, a corner of a cottage owned by a widow named Reynolds, and the whole of the three-story frame building numbered 1204-6-8 Grove street, owned by A. Delair.

—Preliminary work on the San Diego jetty is rapidly nearing completion. The machlnery to be nsed at the Sweetwater quarries has arrived and is ln place, and a spur track to the quarries has been laid. Quarrying of rock in great quantities will now begin. On North island an office for Superintendent Smith is completed and work ls progressing with the railway.

—The Tacoma Board of Public Works has discovered a shortage of 5,600,000 gallons of water daily in the water company's guaranteed supply, which was purchased recently hy the city, together with the electric-light plant, for $1,750,000. The board says this shortage will prevent the delivery of 10,000,000 gallons of water daily, to secure which from other sources will cost the city $1,500,000.

—Much work is in view at the Mare Island navy yard, the following ships being booked for repairs: The monitor Monterey, the cruiser Bostnn, the ships Alert, Marion, Ranger, Mohican, Alhatross, Bear, Rush, Lancaster, the lighthouse tender Manzanita, and the reconstruction of the Hartford. This, with the monitor Monadnock now under construction, will increase the force from 700 to 1200 men when the work is fully commenced.

—General Superinteodeot Fillmore of the Southern Pacific Company reports that durlng the month of Angust the shipments of green fruit from this State averaged 55 carloads a day, a quantity sufficient to keep several large cities supplied with table delicacies. In September the average ontput was 47 carloads a day. This is a large increase over last season's shipments. Experts in railroad traffic predict still greater shipments next year.

—The Postoffice Department has accepted the offer of the North American Navigation Company to carry mails for Mexico and Central America. The new arrangemeot is not a contract, but a designation of the company as an official mail-carrier uoder the general laws. Accordiog to the offer the steamers will carry mails once in 20 days to those ports at which they are compelled tn stop by the provisions of the company's contract with the Central American States.

—The comiog Internatiooal Irrlgation Congress, to he held in Los Angeles duriog the week commencing Oct. 10th, is creatiog much interest. The deliberations of the body will comprise a consideration of the following subjects: Irrigation applied to agriculture, applled to horticulture and lts far-reaching ethical and social possibilities and effects. Irrigation legislation—State, national and International. Irrigation engineering, irrigation securities and irrigation machinery and appliances.

—Wells, Fargo & Co., the corporation that for nearly half a century has held control of the express business on this coast, may have a competitor in the field before the beginning of the new year. Within the next 45 days the contract of Wells, Fargo & Co. with the Southern Pacific Company will expire, and half a dozen express companies, including that giant corporation, the Adams Express Company, will, it is said, be allowed to bid for the privileges of the lines controlled by the Southern Pacific Company.

—Under the direction of electrician Pinkham a new suh-marine cable of 500 volts capaclty has heen laid heneath San Diego bay for the purpose of supplying electricity from the power-house for the new electric road soon to be inangurated on Orange avenue, Coronado, in place of the present steam motor. The cable was unwound from a huge spool statiooed on a lighter, and about 3000 feet of the hig strand was required to reach from the ferry-slip on the San Diego side to a point heside the ferry-slip on the Coronado side of the ferry.

—M. D. Smith has heen appointed receiver of the Farmer's Insurance Company, at Spokane, Wash. Assistant State Insurance Commissioner Mott says the books of the company have been kept so as to deceive the stockholders. The assets, he holds at a conservative estimate, do not amount to more than $5000, and the indehtedness greatly exceeds this. The company has out $2,118,000 worth of policies. In the time between the conclusion of the examination and the receiver taking charge, $21,000 worth of securities were abstracted from the company's vaults.

—The sale of the Pacific Cable Railway Company's property under a decree of foreclosure took place at Los Angeles Wednesday. Representatives of the Consolidated Electric Railway Company, holders of the first mortgage, were the only bidders, the property being knocked down to them for $1,344,320.48. The sale means the consolidation of the two systems now in operation and the ultimate electrizatlon of all the principal lines. M. H. Sherman and E. P. Clark of the Consolldated Company did the bidding for their principals.

—The new steel bridge spanning the San Joaquin river near Stockton between the mainland and Roberts' island was formally turned over to the county Saturday hy the builder—the Pacific Bridge Company. The bridge cost $38 000 and was commenced last February. Its total length is 354 feet and the draw is 280 feet. Roberts' island is a very rich wheat and fruit-producing district of 20,000 acres, and the traffic between that section and Stockton is very heavy. Heretofore the farmers have been compelled to pay toll at one of the half-dozen ferries, but all travel will now be hy way of the free bridge.

—Judge Knowles, of the United States Circuit Court at Helena, has appointed S. T. Hauser and E. L. Bonner of Montana and F. L. Stanton of New York receivers for the Northern Pacific branch lines in Montana. The application was made by the Farmers' Loan and Trust Company of New York, who asked for a receiver as agent for the bondholders of the hranch lines. This actlon is in line with the decision of Judge Jenkios in the Wisconsin Central case. Three braoch lines for which receivers were appointed show a deficit of about $1,000,000 for the year endiog June, 1893. There will he no change ln the officers of the roads.

—Among the exhibitors of mineral combustibles, coal, coke, petroleum, etc., who have secured awards at the World's Fair are: Washiogton—State of Washington, collective exhibit of coal and coke; Seattle Coal and Iron Company, Seattle, bituminous coal; Black Diamood Mining Company, Black Diamond, bituminous coal; Newcastle mine, Seattle, bituminous coal; Fairhaven Land Company, Fairhaven, bituminous coal; Green River Coal and Coke Company, Seattle, hituminons coal. Utah—Rio Grande Western Railway, Castle Gate, bituminous coal; Church Coal Company, Coal Hill, bituminous coal; Sodrex-Summit Company, Castle Gate, elatorite; Fort Duchene Gilsonite Company, Fort Duchene, gilsooite.

—Ticket Auditor Holton of the Southern Pacific reports the following number of through passengers from and to all points on the Pacific Coast from Jannary tn July, inclusive, 1893:

	Going East.	Coming West.
Jannary	4,800	7,832
February	5,363	7,618
March	6,920	7,133
April	8,115	8,044
May	12,054	8,034
June	8,951	8,539
July	5,935	8,124
Totals	52,188	56 824

—A petition is helng circulated in San Diego, addressed to Congressman W. W. Bowers, and asking for some relief in the matter of labor employed on the Government jetty. It is claimed in the petition that Contractor S. R. Smith has brought all his laborers from Portland and that he pays them only $1.60 per day and charges them $4.50 per week for hoard. The petitlon asks Bowers to investigate.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

NOTES OF PROGRESS—*Ledger*, Sept. 29: In company with Superintendent J. B. Francis of the Alma we visited that property Thnrsday, and fonnd a force of men at work and enough material on the gronod to make one understand that they had gone to work with a determination to posh forward their work as rapidly as possible. Two shifts are at work upon the shaft, which is now down abont 50 feet. It is of three compartmeots and is well timbered with 12x12 sprnce. The foundation piers of the main buildiog have been laid of stone in cemeot, and the sills for a building 28x90 are in position. This building is to contain the engine, the compressor (if a compressor is necessary), and the gallows frame. The foondation and sills are also down for a boilding 20 feet wide extending the full length of the other on the north side. This boilding is for the furnace and boiler, the store-room, the office and the blacksmith and carpenter shops. They are still ronning with a windlass, bnt soon expect to have their machinery, which has already been porchased in San Francisco, on the gronnd. They have contracted with Lessley for 150,000 feet of lnmber, which is being placed on the gronnd as rapidly as the mill can turn it ont. Two hundred cords of wood are now piled in on the gronnd and more is coming daily. The croppings of the ledge which they are going down 500 feet to strike extends and can be traced on the snrface of the Mattley field for 1100 feet, and io many places shows 40 feet in width. The Alma people have commenced work with a determination to sink 500 feet before prospecting the ledge.

Martin Jones of San Francisco is the prime mover in the incorporation of a company to prospect and develop the Bright mine.

H. C. Calahan and J. C. Price, both mining men, are investigating mining interests along the mother lode. They commenced at the Bay State and expect to reach Angels to-day.

The Wildman is preparing to sink another 100 feet. They are now arranging to place a pnmp to keep the water ont of the oew level, and in coosequence have to shut down their mill for a few days.

Jas. E. Dye, representative of the Jackson Gold Fields of Londoo, has commenced operations in the Amador Qneeo No. 1 tnnnel for the purpose of cleaning the shaft and prospecting the ledge.

Work at the Bay State mine is progressing favorably. They are rnnning for the north ore chnte aod have drafted 245 feet, with good indications of the ledge coming in. Reimbering the sonth drift is also in progress and headway is being rapidly made. The hydraulic pump holds the water easily by seven strokes to a minnte.

Butte.

AT FORBESTOWN.—Oroville *Register*: In company with T. H. Dodson of Strawberry valley

and L. E. Norton of this town, on Sunday last we visited tbs Gold Bank or Stow mine at Forhestown and were corteously shown through the works hy Mr. E. Herrin, who has long been connected with the reduction works.

While not attempting to give any detailed description of the mine or works, some points we gathered may be of interest. The lode is situated on the side of a steep canyon and it is qnite difficult to get machinery and supplies down to the mill and reduction works. A shaft hae been sunk to a denth of 380 feet and the main tunnel is now 300 feet, while the ledge itself ie from sixteen to twenty feet wide. During the day from 120 to 140 carloads, each weighing ahout 1800 pounds, are taken from the mine. The rock is crushed in a powerful rock-hreaker run hy water power. It is then fed to the forty stamps, each weighing half a ton, which grind it into a powder so fine that it passes through very fine iron screens in front of the batteries.

We found some eighty-five men at work in the mine and mill, blackemith shop, chlorination works, etc., hut everything is arranged to work the ore on the most economical scale and with as little manual lahor as possible. The mill and other huildings are of the moet substantial character and all the works have been put up to stay. The property ie owned by the Hon. W. W. Stow, and his son, H. P. Stow, is superintendent and general manager.

The Golden Queen mine, under the supervision of C. J. Nickerson, is near the Gold Bank and contains ten stamps. Geo. Hunter is the experienced foreman. We did not have time to visit the mill, as we had an engagement at nine o'clock to go over to the Shakespeare mine, and so climbed up the eteep hill to Forhestown, where we joined the party consisting of twelve visitors from Oroville.

Walking over the hill to the Shakespeare, we were met hy G. W. Price, the general manager of the mine, and shown through the different works. The mill is a substantial thirty-stamp etructure, and, like the Gold Bank, ie run by water power. The rock is similar in character to that found in the Gold Bank and undergoes similar treatment. The property is owned by Alvinza Hayward, and Mr. Montgomery is superintendent, while G. W. Price is assistant superintendent and general manager.

In each of these mines large sume were spent before a mill was erected, and it was only after the ledges were fully developed that the mills were built. Mr. Price has been the active man in charge of the Shakespeare mine and mill; he planned and superintended the building of the various works and has had the active supervision of the running of the property, yet he is quite young, being only twenty-four years of age.

H. P. Stow is also a young man, perhaps twenty-five or six, but to him the whole success of the Gold Bank is due. He took hold of the property when much gold was being lost, and visited nearly all of the important mines in the State, making a careful study of the methods of working the ore. He had studied mining very carefully in Europe prior to this time and he now set about making some changee which produced an excellent result, for he made the mine a very profitable one. To these young gentlemen Forhestown owes much of her present prosperity.

Other mines are heing developed and it is prohable that other mills will soon be erected.

Calaveras.

ANOTHER ENTEEPRIEE.—*Chronicle:* A company of San Francisco capitalists have about concluded negotiations for 200 acres of land in Poor Man's Gulch, owned by Gobi & Del Orto of this place, for the purpose of opening up and developing the quartz ledges known to exist on the tract.

El Dorado.

MINE BOUGHT.—*Democrat*: The Schneider mine, on Mathinas creek, has been purchased by a company of Sacramento capitaliete, and active operations to develop it are already under way.

Inyo.

REPOETEN SOLD.—*Index:* Report eays that Frank Sorba has sold his silver-lead mine at Darwin to Los Angeles capitaliets for $10,000, and that the money has been paid.

Lake.

QUICKSILVEE ENTEEPRISE.—Sacramento *Bee:* J. T. Thatcher, L. G. Emerson, J. Desmond and J. L. C. Smith of this city are largely interested in the Oalistoga Consolidated Copper and Quicksilver Mine, nine miles north from Calistoga, in the southern part of Lake county. The vein ie from three to nine inches in thicknese, and every few feet a bed of rich ore is discovered. The mine-ownere have tunneled into the hillside 200 feet. The vein is about 60 feet helow the surface. The ore contains $300 in silver, $40 to $75 in copper and traces of gold to the ton. Adjoining the claim are deposits of quicksilver. Ten olaims have been located. The company proposes shortly to erect smelters to reduce the ore. Twenty-seven years ago the country in the vicinity of the mine was reputed to be rich in ore. Some mining was then carried on, but no efforts were made to systematically work the mine until recently.

Monterey.

WARTHEN COAL MINE.—Geo. Reasons of Parkfield was interviewed last week by a reporter of the San Miguel *Courier* regarding the progress of coal mining at Warthen canyon. near Priest valley, Monterey county. The *Courier* says: "Messrs. Hart and Grabhel, local capitaliste, have sent one carload of the coal to Alcalde, which was tested hy the railroad and pronounced to be of excellent quality. These mines promise to be a big thing for this part of the country, for a number of men are already at work and a two years contract hae been entered into with Mr. Reasons to do the hauling, who, while in town, purchased a large amonnt of supplies, including a Bain wagon. The greatest drawback to the speedy opening up of these coal fields is their inaccessibility, situated as they are in a very wild and rugged country twenty-five miles north of Parkfield and ninetesn from Alcalde, Fresno county, the nearest railroad point. The present road is in such a bad condition and so indirect that Mr. Reasons has decided to commence at once to build another one. There is now plenty of coal to be hauled and that valley may soon see lively times."

Nevada.

GETTINO THEIR DAM READY.—*Union:* The Excelsior Mining Company of Smartsville ie hard at work erecting a dam which will safely hold mining debris from their mine when hydraulicking is resumed. As soon ae the dam is completed the company will apply to the Dehris Commissioners for a permit to resume mining.

THE WEST DELHI.—*Transcript*, Sept. 28: James English, one of the owners of the Pioneer Reduction Works, has just returned from a business trip to Columbia Hill. He says that a very rich strike has lately heen made in the West Delhi mine in that district. The ledge is large and the rock high grade, being the same general character of quartz that is found in the old Delhi.

WILL MAKE A MINE. — *Herald:* Richard Thomas, over from Birchville, reports the mining claim recently located by his son R. I. Thomas, J. J. Ott and L. P. Schmidt to be a bigger prospect than any one thought. The gentlemen have now located other claims jnst south of the one on Sweetland creek, which are richer than the other. He thinks they have a bonanza, and the wonder is that it was allowed to lie idle all these years.

THE DAISY HILL.—*Union*: For a number of months past, Ohas. H. Taylor, son of M. C. Taylor of this city, hae heen in San Francisco for the purpose of organizing a company to work the Dsisy Hill mine, a very promising proepect. The company has heen formed, and the capital stock is $500,000, half subscribed. C. A. Roberts holds most of the etock, and his associate directors are Alfred H. Walker, C. H. Kingsley, Charles H. Taylor and A. Evelyn Ball.

BEIGHT OUTLOOK.—*Transcript*: A gentleman who came over from San Juan on Wednesday says that within the next six weeks at least four or five Huntington mills will reach there for as many new quartz ledges which will be etarted up on the Ridge. Two of them are to be put up near San Juan. One will be erected on Sweetland creek and two more in that neighborhood. He says the mine which was recently located hy Richard Thomas, Richard I. Thomas, J. J. Ott and L. P. Schmidt will unquestionahly prove to be a genuine bonanza to these gentlemen.

The same informant predicts that within a year there will be as many men employed in working quartz ledges on the Ridge as there were in the hydraulic mines during the palmiest days of that industry.

THE SOUTH DAKOTA.—*Tidings*: Recent developments at the South Dakota mine are of a very encouraging nature. The ledge has improved in appearance very much. The shaft hae attained a depth of 128 feet and the ledge is fully two feet in size, the rock showing free gold in good quantities. Apart from the size and nature of the ledge, the owners have reason to be proud of the fact that only surface water was encountered, and it is now certain that the Idaho mine drains the entire length of the South Idaho location (3000 feet). Seventeen years ago, in the 700-foot level of the Idaho mine, going east, a large stream of water was struck at the same time several eprings near the residence of Joseph O'Keefe were drained. It has developed that the South Idaho ledge was also drained at that time. Ae above stated, the only water found in the South Idaho ie snrface water and at this writing amounts to but 500 gallons in 24 hours. The company will be able to eink fully 700 feet without having water to handle. This, of course, means a saving of thousands of dollars which would otherwise be expended in pumping, etc. The mine is in the same mineral helt as the Idaho-Maryland and but 1500 feet south of ite illustrious neighbor, and bide fair to rival it as a produncer. Nine men are steadily employed, and sinking is going on all the time. Considerable quartz is extracted every week, and if the company had a mill on the ground, enough could be extracted to more than pay all expenses. No assessments have ever been levied by the company, fnnds being raised by selling company stock.

Plumas.

ON NORTH FORK.—*National-Bulletin*, Sept. 28: The mining outlook in the northern part of the county is improving. The Big Flat country is attracting attention. It is understood that the Fred Scott claim at the lower end of the Flat is paying well. There is talk of capitalists taking hold of properties on the Flat. Should they do so, there is hut little doubt that one of the best drift mines in the State would he opened up. Several mining men from Nevada have quietly drifted into the northern part of the county making inquiries about quartz properties.

IN GENNESEE VALLEY.—Plumas *National-Bulletin*: Joseph Gruss is pushing work at the Genesee mine. He has 12 men employed, ie running the mill steadily, and the impression exists that considerable money is being extracted. This mine has yielded, in the past 30 years, a large amount of money, and yet it has been worked in a small way only—in fact it has scarcely been prospected. Several improvements have been made on the premises.

Some men are working at the Brandt mine, putting things in shape for active work on the property, which was recently purchased by capitalists from the State of Nevada. It is expected that next month concsntrators will be sent in from Reno and placed in the mill.

Last week, A. Dragovich returned from San Francisco, bringing with him some mining men to look at the Lucky S mine. Ore from this property is reported to prospect vsry well. Senator Westlake of Virginia City, took 40 pounds of ore from one of the tunnels, milled it by a new process, and secured returns at the rate of $37 per ton.

GRANITE BASIN ITEMS.—Cor. *National-Bulletin*, Sept. 27: Blsisdell & Co. are erecting a fine house on the property of W. C. Graves, whose mine they recently honded. They have several men at work in the mine.

Landregan & Co. have resumed work again on the old Minto mine and are making extensive alterations and improvements on the property. Two six-horse teams passed through the Basin loaded for them this week, and another team is due now. They will commence running the mill at once and intend to put on a large force of men.

H. Waldron has two men at work and is rnnning his mill.

Peterson and Toland are rnnning their mill steadily on first-class ore, and are doing well. They are at work on the Schneider mine.

Messrs. See & Jolly have several men at work on the Specimen mine, and the ore which they are taking out is said to consist of nearly as much gold as quartz.

San Bernardino.

ON THE COLOEADO.—San Bernardino dispatch, Sept. 30: The Pichacho Gold Mines Company will etart work to-morrow with 125 men. These placer mines are located about 25 miles above Yuma, on the California side, and will be operated by pumping water for sluicing purposes out of the Colorado river with three Worthington pumps, 20 tons each, throwing 300 miner's inches of water 500 feet high and 26,000 feet distant from the river through an 11-inch steel screwed-joint pipe. For this purpose a 500-horse power engine is used. The test of the pump and plant made a few days ago proved satisfactory.

Sierra.

RICH STRIKE.—Sierra Valley *Leader*: A rich strike has been made in the Butte Saddle mine, near Sierra City. A tunnel was run until they were at a depth of 350 feet from the surface. They have now commenced sinking at the end of the tunnel and the ledge has grown much larger and is better defined. The rock is estimated to be worth in the neighborhood of $100 per ton, and it is thought that some of the rock will pay as high as $300 a ton. A. Sitze, the butcher at Sierra City, is the principal owner.

FOREST CITY NOTES.—Oor. *Messenger*, Sept. 28: The company who took a five-year lease on the lower end of the South Fork are progressing finely 800 feet from the mouth of the main tunnel. They have started a new drift which will put them into good paying gravel at ahout 250 feet and give them drainage for the future.

The Mt. Moriah is looming up and if the weather keeps fair will have their 20-etamp mill running hefore snow flies. This will be a grand addition to Sierra county.

Robert McMnrray, Hon. A. B. Dibble and others have taken in hand the Idaho quartz mine, on the Alleghany side and near the Oriental mine, and are now running a main tnnnel which will cut the ledge at about 150 to 200 feet. The prospecte that have been taken on thie ledge heretofore are promising, bnt it was in the hands of poor men who were unable to develop the property.

Trinity.

GOON BONY OF ORE.—*Journal*: The Enterprise Mining Company of East Fork have a fine body of ore in the Lone Jack mine, an extension of the Enterprise, and are running their five-stamp mill night and day. Mr. Chas. Lobdell, one of the owners, informe us that the mine is looking very well. Two men can take out sufficient ore to keep the mill running, and with the facilities for handling rock, it can be crushed very cheaply.

THE MAPLE.—*Journal*: J. M. Tompkins was in from Junction City this week and says that the prospects of the Maple mine on Canon creek are very favorable. The ledge has been struck in the lower tunnel and carries some very rich rock. The ledge in the upper tunnel is three feet wide and of a good character of ore. Cutting the ledge in the lower tunnel gives 120 feet of stoping ground. The company have an arrastre on the property with a capacity of crushing five or six tons a day.

Tuolumne.

FINE OEE.—*Democrat*: The Jo Hooker mine is located in the vicinity of Soulshyville, and it holds out encouraging prospects to its enterprising owners. The ore will yield $25 per ton in free gold, and the vein being large it gives every assurance that the mine will soon take rank with some of our hest mineral properties.

NEVADA.

Washoe District.

LAST WEEK AT THE COMSTOCK.—In the Ophir and Mexican mines all work on the 1565 level has been discontinued and implements and machinery removed therefrom, and prospecting is to he resumed on the 1465 level of hoth mines. On the 900-foot level of the Union shaft the north drift from the main west drift is 176 feet in Sierra Nevada ground, and the face is in quartz giving low assaye. The south lateral drift from the Sierra Nevada tnnnel on Cedar hill is in 98 feet and the face is in porphyry and quartz. In the Andes mine some quartz of low assay value is being cut in a northeast drift on the 420 level.

There has heen no change in the condition of the Best & Belcher and Gould & Curry mines. Few miners are at work in them. In the Savage mine, on the 1100 levsl, they continue to extract ore of fair grade at several points above the floor of this level up to the nineteenth floor. They are doing considerable prospecting work between this and the 950 level. During the week they hoisted 258 cars of ore from this level. Shipped to the Nevada mill 120 tons. On account of the mill being crippled no ore was crushed since last weekly report. The samples average $27.35. They shipped to the United States Mint, Carson, September 21, 294 pounds of crude hullion.

In the Hale & Norcross mine the east crosscut 1300 level from the bottom of the winze was extended 24 feet, total length 31 feet; face in streaks of ore of low assay value. Sinking the winze in the ore will be resnmed this week.

In the Chollar mine they started a drift on the 100 level at a point 145 feet north of south line, which is now out 65 feet; face is in porphyry and bunchee of quartz which give fair assays; are yet engaged in making repairs to the main incline below the 900 level.

In the Potosi mine the upraise from the south drift on the sixteenth floor above the 930 level has advanced 38 feet on the slope; top in porphyry and low-grade quartz. The north drift 28 feet below the 1000 level is out 66 feet; face shows four feet of fair-grade ore; are sinking a winze below the south stope 1000 level, which is now down ten feet in ore of good quality; extracted and sent to the mill the past week 188 tons and 250 pounds of ore from the 1000 and 1100 levels; milled during the week 215 tons; on hand at mill 120 tons and 1450 pounds; average battery assays, $23.58; average car-sample assays, $24.63; shipped to the United States Mint at Carson 380½ pounds of crude hullion. At the Ward shaft the west drift from the station at the 820 level is out 188 feet and the face is in hard porphyry.

There is an improvement in the Yellow Jacket mine. The upraises above the 1100 level are cutting ore, some of which assays high.

ARIZONA.

MINING NEWS.—Prescott *Journal-Miner*, Sept. 27: H. M. Palmer has bonded the Dividend mines from Johnorew & Butler.

Marsh's mill at Minnehaha is running 12 hours per day. There is an abundance of ore to run day and night, but water is scarce.

F. L. Wright has purchased one-third interest in the Legal Tender mine in Big Bug district.

A. C. Gilmore and Charles Bradbury have eight tons of ore ready for shipment from the Zero mine. The ore is silver and goes 675 ounces per ton.

Another rich strike is reported in Chaparral district, a district already prominent on account of the numerous strikes made there. The lucky owners of the new find are John Merwin and B. H. Smith. The vein is said to be 14 inches wide and assays $212 per ton in gold. The owners will push development work on their claim.

The Yarnell mill is running steadily, doing satisfactory work. Considerable improvements are being made around the mine and mill.

John S. Jones' mill, at Big Bng, has been running now for several months.

The five-stamp mill owned by Dr. J. Miller was started up yesterday on ore from the Westlake mine and worked very satisfactorily, considering that everything is new. The machinery has been placed in position under the superintendency of Mr. Mahoney, formerly engineer of the Prescott Water Works, and is being rnn hy him. This property is situated only four or five miles from town. It is a gold property and is opened up by a tnnnel running in on the vein a distance of between 300 and 400 feet. The ore assays well, and the doctor now bids fair to eecure returns from his three or four years' development work of the property.

J. D. Hslm, who returned yesterday from a visit to the Austin & Owene' gronp of mines, says that, as far as developed, the property shows up very hig. The ledge is immense, being 20 feet or more across it, while the ore assays well. Of course the owners have not had time to make much of a showing yet in the development of this monster ledge, and it is impossihle to determine exactly what the ore will mill. He thinks that $10 per ton would he a conservative estimate, although present indications are that it will go $40 per ton.

OREGON.

MAKINO WAGEE.—Rogue River *Courier*: Two men are drifting on a bar just helow the mouth of Galice creek on Rogue river and cleaning up from $6 to $10 per day. They have strnck a pay channel and are digging a tunnel four feet bigh and 12 wide, working on their knees with pick and shovel and wheeling the dirt to slnice boxes placed eome distance below.

PLACEE MINE.—Rogue River *Courier*: The Illinois Hydraulic Mining Co.'s placer on Bollen creek, near the California line hids fair to rival the famous Wimer and Simmons placere in richness and extent. The company has 160 acres of very rich dirt, which they have been prospecting for several monthe with a "self-shooter" and as a result, six ounces of gold wae picked up off a strip of bedrock 36 feet long and six feet wide last week. The bank which is composed of porphyry and serpentine, averages 50 feet in depth, and the bedrock is a light-colored scaly granite. A magnificent fall of water has heen obtained by digging a ditch three miles long, and a natural lake at the summit of the mountain near hy will act as a reservoir from which water can be obtained all summer. A string of pipe and a monitor are now heing placed in position and as these fields furnished many hig nuggets in early days, we expect to hear of hig clean-ups on this new property. Supt. Doney says there is plenty of good mining ground near Browntown awaiting energy to develop, and he is willing to guide the

stranger to rich fields still nndeveloped. The elevation of this placer is 3500 feet, so there will be nn tronble ahont dnmping the debris. Six men are now employed at the mine, bnt the force will have to be increased as developments proceed. Snpplies for the mine are obtained from Browntown, distant six miles.

JACKSON COUNTY NOTES.—*Times*, Sept. 30: Messrs. Hill and Stevens, who have been prospecting an extension of the Homestake mine in Evans' Creek precinct, have struck a ledge over two feet wide, which prospects well.

The Jacksonville Milling and Mining Co. met a few days since and ordered the stock upon which assessment had not been paid sold. Prospecting will be resumed at an early day. A well-defined ledge is in sight, but whether it is rich remains to be seen.

E. Sanderson Smith, the well-known mining expert, who has done so much to attract the attention ot capitalists toward southern Oregon, will resnme operations at the Gold Hill mine in a short time. He is hopefnl of striking a rich seam of ore which will etartle the oldest inhabitant.

The Monntain Lion mine, in Miesonri Flat district, has not been honded to any one. Bailey & Co. are working it aud taking ont free-miltting ore to be crushed on their two stamp arrastres. As they have already considerahle high-grade ore on the various dumps, and tons more in sight, an extensive and sncceesfnl run will be made. Mining men who are looking for first-class gold mines should not fail to visit the Monntain Lion and convince themeelves that it is one of the best-paying qnartz properties in the State.

"The Annie mine was never in better conditon than it is to-day," said J. B. McGee, president of the Aunie Mining Company, to a reporter one day this week. "By sending onr concentrates to Tacoma for reductiou," he continued, "we have just doubled our product in pure gold, and the total monthly average outpnt at the present time ie about $6000. We have recently pnt in two emall concentrators, capable of turning out a ton of concentrates per day. The first ton of this material wae shipped to Tacoma on July 15th and uetted ns abont $100. Since that time we have been shipping regularly, aud uow the average retnrn is about $100 per ton. This, taken together with another $100 worth of metal crushed ont by a five-stamp mill, makes np the neat little snm I have spoken of."

NEW MEXICO.

THE TUERTO PLACER FIELDE.—Some attentiou ie heing paid jnst now in Eastern financial circles to the Tuerto placers, or gravel deposit, lying in the extreme eouthern portion of Santa Fe conuty, New Mexico. It ie claimed in circnlars of the Irrigation and Hydraulic Mining Company that the deposit has a snperficial area of 11,684 acres (owned by the company), and has an average depth of 36 feet, or 678,600,720 cubic yards, which it is assumed will prodnce at least $1 per cnbic yard. The possibility thus stated would be a sum greater than the gold placers have yielded in California. The company, however, assnme that thie $1 per cubic yard will be a moderate yield for the eutire 678,600,720 cubic yards they own. The recorded rainfall is but 11 inches per annnm. The only dependence for either present hydraulic mining or future irrigation lies in the possibility of obtaining a eupply of water from the earth itself. There are now four wells giving water in considerable volnme. No particulars as to qnantity are at hand with regard to the laet strike. The first well is dowu 585 feet, and the water rises 450 feet in the hore. This is not nsed for hydranlic work as yet. A flow of 186 gallons per minnte, or 11,160 per hour, and 267,840 gallons per day of 24 houre, has been steadily maintained. Under a five-inch pressure (this ie the new Mexican miner's inch) thie body of water will prodnce a etream of nearly 17 miner's inches. An ingenious and valnable hydranlic washer, on the centrifngal principal, invented hy M. Bazin, a French hydraulic and mechanical engineer of repute, which has had au extended use in Sonth Africa, on similar gravel placere, has been purchased and put in operation at the Tuerto placers. So well satisfied are the managers that the nnmher of the machines will soon he increased to six, ordere having already heen placed. It is claimed as able to wash one cnhic yard of gravel with one cubic yard of water.

BACK FILES nf the MINING AND SCIENTIFIC PRESS (unbonnd) can be had for $8 per vulume of six months. Per ysar (two voiumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 5, 1893.

The silver market has maintained its general evenness during the week. The silver debate is still going on in Congress, and much confidence is expressed that the repeal hill cannot be passed without a compromise. Indeed, it seems to be certain that the single-standard men must make concessions. The meeting of the Pan-Bimetallic League at St. Louis has been an event of the week.

Fine Silver in September.

Bar silver sold in London on the 1st of September at 34d and in New York at 73¼c. The market throughout the month was irregular. On the 11th, the rates were 34½d in London and 74⅞c in New York. These were the highest figures for the month. The extremes in both for the first nine months of the year were as follows:

	London High.	London Low.	New York High.	New York Low.
January	38 9-16d	38 2-16d	84c	82½c
February	38 8-16	38 2-16	84¼	83¾
March	38 6-16	37 9-16	83⅝	81⅞
April	38 5-16	37 14-16	83⅜	82½
May	38 9-16	37 8-16	84⅛	82¼
June	38 12-16	30	83¼	62
July	34 12-16	32 2-16	75	69
August	34 12-16	32 11-16	75½	70¼
September	34 8-16	33 14-16	74⅞	73

In September, 1892, the extremes in London were 38 5-16d to 38 2-16d, and for the first nine months of that year 43 12-16 to 37⅝d.

Coinage of the San Francisco Mint.

The September coinage of the San Francisco Mint compares as follows:

	1892.	1893.
Double eagles	$2,160,000	$1,780,000
Eagles	.....	220,000
Standard dollars	100,000	.....
Half dollars	.....	200,000
Quarter dollars	.....	20,000
Totals	$2,260,000	$2,220,000

Silver and the Metals.

NEW YORK, Oct. 5.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.	Copper.	Lead.	Tin.
Thursday	34⅛	74	9 70	3 65	21 00
Friday	33⅛	74	9 70	3 65	21 00
Saturday	34⅛	74	9 70	3 65	21 00

The Stock Market.

SAN FRANCISCO, Oct. 5, 1893.

Dullness unprecedented is the condition of things on the stock market. The miners on the Comstock who decline to reduce wages are in part held responsible for the stagnation, the claim being advanced by operators that active work would be resumed if the wage question were settled. Meanwhile, transactions are insignificant.

The monthly financial statements of the mining companies have been filed. The following companies report having had cash on hand September 30, 1893, with the expenses for that month unpaid: Andes, $8353.41; Alpha Consolidated, $4424.79; Belcher, $2521.60; Bullion, $13,106.22; Bodie Consolidated, $8750.65; Best & Belcher, $6115.23; Consolidated California & Virginia, $56,985.54 in cash here and in Virginia City and unsold bullion valued at $14,443.15; Consolidated Imperial, $1463.33; Challenge Consolidated, $339.75; Caledonia, $8401.02; Consolidated New York, $333.38; Chollar, $2921.58; Crown Point, $2610.79; Confidence, $1560.51; Exchequer, $679.33; Gould & Curry, $3903.96; Hale & Norcross, $11,203.16; Julia Consolidated, $426.35; Justice, $1609 83; Mexican, $18,101.82; Mono, $4713.56; Nevada Queen, $562.25; Ophir, $17,011.99; Savage, $7646.49; Segregated Belcher, $40.96; Sierra Nevada, $19.197.67; Silver Hill, $85.02; Syndicate, $1339.71.

The following mining companies report having had an indebtedness September 30, 1893, with the expenses for that month unpaid: Alta, $11,123.90; Butwer Consolidated, $3116.31; Commonwealth, $25,361.43; Grand Prize, $524.87; Lady Washington; $1842.88; Occidental Consolidated, $7000 due on company's bank, less $237.18 cash on hand; Overman, bills payahle of $5990, less $547 cash on hand, and a balance of $5118.70 to he collected in the pending assessment; Potosi, $20,046.72; Utah Consolidated, $1119.

Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from Louis Conrath, attorney in fact for the Excelsior Water and Mining Company, for permission to mine by the hydraulic process in the Blue Gravel Placer mine, near Smartaville, Nevada County, California, and to deposit tailings in an old hydraulic pit, hereby gives notice to all concerned that a hearing will be held at the office of the Commission, room 92, Flood Building, San Francisco, on October 17, 1893, at 1:30 o'clock P. M. On and before this hour and date all parties interested may file affidavits, plans, and maps, in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

NOTICE.—The California Debris Commission, duly appointed under the act of Congress of March 1, 1893, having received a petition from B. Below and others for permission to mine by the hydraulic process in the Polaris, Etna and Austral mines, situated in Goodwin Township, in Plumas county, California, and to deposit tailings behind a dam to be built in Hopkins' creek, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92 Flood Building, San Francisco, on October 10, 1893, at 1:30 P. M. On and before this hour and date, all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission. W. H. Heuer, Major, Corps of Engineers, Secretary.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from A. Steinberger for permission to mine by the hydraulic process in the Brandy City District, situate at Brandy City, Sierra County, California, and to deposit tailings in an old hydraulic pit, gives notice to all concerned that a hearing will be held at the office of the Commission, room 92, Flood Building, San Francisco, on October 10, 1893, at 1:30 o'clock P. M. On and before this hour and date, all parties interested may file affidavits, plans and maps in support of their respective claims.—By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from H. Buckley and Louis L. Hillman for permission to mine by the hydraulic process in the Illinois Gold Gravel Mine, at Secret Diggings, near the Forte, Plumas county, California, and to deposit tailings in an old hydraulic pit, hereby gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on October 24, 1893, at 1:30 o'clock P. M. On and before this hour and date all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary of the Commission.

505,331—SCREEN HOLDER—J. Scouler, S. F.
505,414—BALLOON—C. A. Smith, S. F.
505,134—RAIL HEATER—Smith & Knowlse, Spokans, Wasb.
505,257—CLOTCH—I. F. Tbompson, S. F.
505,330—MOTOR—J. E. Wsst, Centralia, Wasb.

FOR THE WEEK ENDING SEPT. 28, 1893.

505,548.—CARPET STRETCHER—C. W. Anslsy, Medical Lake, Wash.
505,684—NUT LOCK—J. M. D. Bland, La Crande, Or.
505,697—FURNAOE—C. M. Bridges, Seattle, Wasb.
505,599.—POMP—Fultnn & Ames, Gait, Cal.
505,480.—EXCAVATOR—W. M. Gross, Spokane, Wasb.
505,605.—RAILWAY CONDUIT—C. W. McNear, Oakland, Cal.
505,575.—GYROSCOPE—J. N. Rowe, Seattle, Wasb.
505,544.—VEHICLE TOP—J. U. Tabor, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

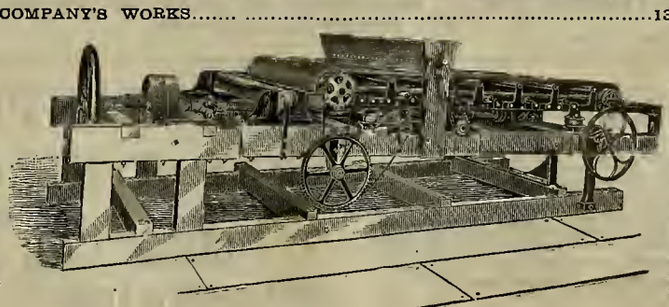
THE McGLEW ORE CONCENTRATOR COMPANY.

{ PATENTED } { May 5th, 1893. } **CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE.** { FRANK BARRERE, Secretary. }

CAN BE SEEN IN OPERATION AT THE COMPANY'S WORKS.....132 MAIN STREET, SAN FRANCISCO, CAL.

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectivensss, combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.



PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.

FALLS MINE, Ioo, SHASTA Co., CAL., May 25th, 1893.

MR. THOS. MCGLEW, President McGlew Ore Concentrator Company—DEAR SIR: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a True, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works.

FULTON ENGINEERING AND SHIP-BUILDING WORKS.

Successors to FULTON IRON WORKS (Hinckley, Spiers & Hayes), and F. A. HUNTINGTON.

The Rand Air Compressor.

One of the very interesting exhibits in Machinery hall, at the World's Fair, is a large air compressor in operation, supplying air to work other machinery. It was installed by the Rand Drill Company. It is of special interest to large mine owners and others who have occasion to use this class of machinery. The compressor is a compound, both air and steam; it is fitted with a componnd condensing Corliss engine of the latest design, connected to a crankshaft and heavy fiywheel. The piston rods passing through the back head of each cylinder connect with the piston rods of the air cylinders. The dimensions of the cylinders are: steam high-pressnre, 22 in.; steam low-pressure, 40 in.; air low-pressure, 32 in.; air high-pressure, 22 in.; diameter, all 48-in. stroke. In action the air is taken into the low-pressure air cylinder and compressed to a pressure of between 25 and 30 lbs. per square inch; it then passes through a water jacketed receiver and into the high-pressure cylinder, where it is compressed to as high a pressure as is required. The pressure reqnired is regulated by a device acting directly on the cut-off mechanism, in connection with the governor; it is connected with the same shaft as the governor, but does not interfere with it or its action. The pressure of air is recorded daily by a recording gauge, and an examination of the cards which are kept on file shows how closely the compressor is regulated to maintain a uniform and constant pressure of air at a given point.

RAND DRILL CO.'S COMPOUND CONDENSING CORLISS STEAM ENGINE DRIVING COMPRESSED AIR CYLINDERS.

An ingenious contrivance for gold washing has been devised and is in use on the Snake river, near Ontario, Or. A large vertical wheel, supported on two parallel and connecting scows, anchored firmly in the current of the river — the wheel similar in general to those in use for irrigation—is moved by the current and capable of lifting about three gallons of water per minute to a height of 14 feet. This volume of water is projected on the gravel brought from the bar, forcing it through a modified form of "grizzly." The coarser portions are thrown into the river; the finer particles, consisting of black sand, small rubies and gold flakes, flow downward in a reverse direction through a wide, shallow trough, laid with heavy burlap, the rough surface of which is designed to arrest the fine gold.

The increased activity in the gold mines of Colorado is shown by the record of bullion operated on by the Denver Mint for the three months ending Octoher 1. The total is $511,549.08. In handling this bullion $4,912 81 in silver was taken out, making the total amount of gold and silver handled from the State $516,461.89. The total amount of bullion handled by the same mint in the twelve months of 1892 was $1,120,025.04, making an average for each quarter of $280,006.24, against $516,461.89 of the quarter jnst closed.

No "official programme" of the State Miners' Association was circulated at the late convention; but there was a "programme," which was compiled as an advertising dodge without the sanction of the association or any officer thereof. No one could offer any reasonable objection to such a scheme if it cost the convention nothing and was not more than it pretended to be. It seems proper to mention, however, that this particular programme did not emanate from and was not published by this office, or any one connected therewith. Such impression might have been created by the fact that several of the articles printed in the programme—"History of the Miners' Movement," etc.—appeared originally in this paper, and were appropriated bodily without credit or acknowledgment of any kind—a proceeding that was both cheeky and dishonest. It is to be hoped that future "programmes" will be issued on a more creditable basis.

Director of the Mint Preston inclines strongly to the opinion that the present annual output of gold will be more than maintained in the future. It has shown a steady increase since 1874, when it reached its lowest ebb, and in view of the impetus given to gold mining by the fall in silver and the rich developments in South Africa, the increase is likely to be at least $10,000,000 greater this year than it was last year, the excess in this country being $3,000,000 to $4,000,000, and in Africa $5,000,000 to $7,000,000.

Going to the Transvaal.

There is no doubt that the Transvaal, in South Africa, is a country very rich in gold and certain to be one of the largest producers of the yellow metal in the world. The output has grown at an astonishing rate. In a few years a city with 30,000 people (Johannesbnrg) and a prosperous and populous country have been literally carved out of the wilderness. Large sums of capital have been invested and hundreds and thousands of laborers employed. The transformation has been going on for several years but it is only recently that the fame of the Transvaal has reached all quarters of the globe. In consequence, thousands of immigrants are being attracted thither. Four hnndred miners have recently gone from Montana and a colony is about to start from Sonoma county, in this State. It is probable that these people have not sufficiently informed themselves of the actual state of things in the Transvaal. The labor situation there is not promising. The Johannesburg *Sentinel* is said (we quote second-hand) recently to have declared that there is "no demand" for carpenters, masons, bricklayers, plasterers and blacksmiths. The country is "overstocked" with fitters, miners, wagon builders, tailors, hakers, dressmakers and waiters; "badly overstocked" with engine drivers, house decorators, painters, printers and shop assistants. The situation as to clerks is described as "terrible," the cab drivers are mostly colored, and the teachers are "poorly paid." There is, however, "plenty of room" for good white domestic servants. The rent of a three-room cottage is from $35 to $40 a month, and good table board is from $8 to $10 a week.

In San Francisco at the present time Dr. J. W. Matthews, F.R G.S., who has lived 25 years in South Africa is lecturing on the Transvaal. Here is what he says about one feature of living there:

"The duties on imports are very high. For instance, on every cigar a man smokes he must pay a duty of 6 cents. All cigars are brought from Havana, and their average cost is 36 cents. On hams the duty is 24 cents a pound, making the total cost 60 cents a pound. On every banana taken into the country the Government collects a tax of 2 cents. These are only instances of the tremendous rate of customs."

Notwithstanding these disadvantages, great fortunes have, of course, been made. But they are not as a rule made by laborers. The gold-bearing reef is very much limited in area, and no doubt claims are not to be had for the asking.

EXECUTIVE COMMITTEE.

Appointed by Chair.

Charles G. Yale, S. J. Hendy, S. B. Christy, Edward Coleman, E. A. Belcher, A. J. Ralston, B. F. Dunham, W. W. Montague, A. S. Hallidie, John Bermingham, Thos. R. Church,

From the Counties.

Amador—E. C. Voorhies and J. F. Parks.
Alameda—John T. Bradley and Felix Chappellet.
Calaveras—S. Poorman and Edward Taylor.
Butte—Frank McLaughlin and A. Ekman.
Sierra—Dan T. Cole and Frank R. Wehe.
Nevada—J. S. McBride and Alf. Tregidgo.
Placer—J. E. Doolittle and Charles F. Hoffman.
Tuolumne—J. W. C. Maxwell and W. H. Martin.
Shasta—J. E. Lyon and J. H. Morton.
Trinity—John McMurray and O. M. Loveridge.
Siskiyou—R. H. Campbell and Andrew G. Myers.
Yuha—William B. Meek and James O'Brien.
San Francisco—John C. Coleman and S. K. Thornton.
El Dorado—G. W. Cummiogs and J. J. Crawford.

MIDWINTER FAIR COMMITTEE.

The following names were presented from the several counties ot constitute the committee:

Amador—A. B. Call, George Heazelton and James H. Tibbetts.
Alameda—A. J. Ralston, H. G. Blaisdel and Grant I. Taggart.
Calaveras—S. Poorman, I. H. Reed and S. S. Moser.
Butte—Frank McLaughlin, A. Ekman and L. L. Meyers.
Sierra—To be announced hereafter.
Nevada—George Mainhart, S. P. Dorsey and Fred Zeitler.
Placer—J. E. Doolittle, Harold T. Power and B. F. Hartley.
Tuolumne—Charles S. Fitch, D. R. Oliver and John H. Neal.
El Dorado—G. W. Cummings, E. M. Fitzgerald and J. W. Estes.
Shasta—Joseph Bell, A. B. Paul and R. M. Seltzer.
Trinity—To be announced hereafter.
Siskiyou—John Daggett, R. H. Campbell and James Vance.
Yuha—James O'Brien, William B. Meek and Joseph Durfee.
San Francisco—S. J. Hendy, William Johns and F. Chappellet.

The General Executive Committee was authorized to fill all vacancies, and the Chair said the matter of appointing the Central Committee was so important that he desired more time to think over his appointments.

THE Idaho mine, Nevada county, has just declared another dividend of $9 per share. There are 3100 shares of stock in the mine, so the total amount of the dividend was $27,900. The dividend declared was from reserve cash on hand and from what the Maryland Company has paid to the Idaho under the terms of the agreement entered into last May. The dividend is No. 277, and the full amount declared from the first up to the present dividend is something over $5,024,000. The gross proceeds of the mine and other sources of revenue connected therewith are about $11,750,900.

A Notable Convention.

The miners' convention fully realized all expectations in point of attendance and in interest; and in results it was quite as important as either of its predecessors. It was strictly a business session from start to finish. There was little sentiment and much work. The delegates were animated by a single purpose, and that was to put their views on various questions affecting their interests in concrete form, that they might have favorable effect upon proposed Congressional legislation. The session was harmonious in the extreme. No mistakes were made and no element was left dissatisfied and unrecognized.

The work of the convention may be summed up briefly. The Stewart bill was the principal object of attack. The convention placed itself on record as opposed to several of its important provisions, the objections to which have heretofore been fully indicated in this paper. But it favored other provisions. For instance, the following, now in the Stewart bill, were indorsed: "Provided, that the presence of rock in place bearing gold, silver, cinnabar, petroleum or other valuable mineral, shall be regarded as presumptive evidence that the land containing the same is, and always has been, mineral in character. And provided further, that in investigating the character of land with a view to ascertaining whether it is more valuable for mineral than agricultural, evidence may be taken of the mineral discovered or developed adjacent to such land, proof of which shall be presumptive evidence that the land in question is mineral in character. And provided further, that wherever land is proven to be within a well-defined mineral belt, such land shall be deemed, presumed and taken to be and to have been mineral land, unless the contrary is proven."

The great importance of the incorporation of these provisions in the revised statutes of the United States is apparent. It means a complete change in the policy of the Government toward miners, as exemplified in the rulings of the Land Department. As it is now, the miner is compelled, in making application for patent, to prove that mineral land is mineral land—in other words, to demonstrate that black is black or white is white. The presumption is against the miner, and in favor of anybody and everybody else. All land in mineral districts is agricultural land until it is fully and elaborately and conclusively shown to be mineral land.

These provisions contain another significant feature. Land in mineral belts shall be considered to be and *to have been* mineral land until the contrary is shown. It is part of the intent of this declaration to give full effect to the intent of the land grant to the Central Pacific, which expressly excepts mineral lands from the gift of the Government. Under the decision of Judge Sawyer, in the Eagle Bird case, however, the railroad company claims all land not known to be mineral land at the time of the grant (1862).

The action of the convention as to hydraulic mining was equally important. The exact sum ($1,030,000) recommended by the Government engineers for impounding works was asked for; and an amendment to the Caminetti Act was further suggested providing that hydraulic mining may be undertaken with no impounding works whatever, if it appears to the Debris Commission that no material injury to others will result.

The convention was a notable one, and it is likely to mark an era in the history of mining in California.

THE new Director of the Mint, R. E. Preston, recently furnished Congress with the following table, showing the decline in the price of silver since 1873, when the dollar was dropped from our coinage:

YEAR.	Value of fine ounce at average quotation.	Gain or loss per cent.	Bullion value of a United States silver dollar.	Gold ratio.
1873	$1.30	0.45 gain	$1.004	15.9
1874	1.28	1.00 loss	.989	16.2
1875	1.25	8 00 loss	.960	16.6
1876	1.16	10 00 loss	.890	17.9
1877	1.20	7.00 loss	.920	17.2
1878	1.15	10.00 loss	.890	17.9
1879	1.12	13.00 loss	.889	18.4
1880	1.14	11.00 loss	.886	18.0
1881	1.14	12 00 loss	.889	18.1
1882	1.13	12.00 loss	.878	18.2
1883	1.11	14.00 loss	.868	18.6
1884	1.11	14.00 loss	.880	18.8
1885	1.06	18.00 loss	.820	19.4
1888	0.99	23.00 loss	.789	20.8
1887	0.98	24.00 loss	.757	21.1
1888	0.94	27.00 loss	.727	22.0
1889	0.93	28.00 loss	.720	22.0
1890	1.05	19.00 loss	.809	19.7
1891	0.99	23.00 loss	.760	20.9
1892	0.87	33.00 loss	.670	23.7
1893, eight months	0.81	37.00 loss	.626	25.5

Work of the Convention.

[By Hon. Tirey L. Ford, Chairman of the Committee on Legislation.]

In response to your request for my views concerning the results likely to flow from the recent annual meeting of the California Miners' Association, I would say:

The above association was organized in January, 1892, less than two years ago. At that time one branch of mining had been so seriously crippled that the miners had about abandoned all hope of its rehabilitation, while the industry as a whole seemed to be languishing. The organization of the State Association brought the miners of California into a closer relationship than had ever before existed since the discovery of gold in California. As a result, puhlic attention was directed to the needs and condition of the mining industry in this State and the serious loss to commerce through the limitations that had been unfortunately placed upon the production of gold. The cause of the miner was promptly presented to Congress and a law secured recognizing hydraulic mining as a legitimate industry and creating a Federal Commission to supervise and regulate that branch of mining in California. Our State Legislature was not less prompt, and, when its last session adjourned, it left upon our statute-books two laws by which the State not only recognized the legitimacy of the business of hydraulic mining, but pledged financial aid to the extent of a quarter of a million of dollars to aid in its rehabilitation, conditioned only upon an appropriation of at least as much by the General Government. In the meantime came the famous Gilbert decision in the North Bloomfield case, which, in substance, laid down the rule that hydraulic mining might be carried on when no material injury resulted therefrom, and further recognized the efficacy of artificial works for the restraining and impounding of mining debris. These results had all been accomplished in but little more than a year, and the miners began to feel that their day of deliverance was not far distant. Always obedient to the law, the miners had an abiding faith that justice would yet be done them through the medium of the law. The results thus far accomplished justify that faith, and there now seems little doubt that full and fair justice will be done those who builded a commonwealth and saved a nation's credit at the most trying period of its existence.

When the recent convention at Pioneer Hall was called to order the president was able to refer with pride to the achievements of the past, and to predict with confidence the success of united efforts in the future. The members of that convention had grown wise with experience and at once proceeded with the matters before them. Three matters of special importance engaged their attention.

First, in order to carry ont the original intention of the framers of the congressional act known as the Caminetti Act, it was necessary that an appropriation should be made by Congress to at least an amount equal to the appropriation made by the last session of our Legislature, and above referred to. The expenditure of these joint appropriations by the State and nation would subserve the two-fold purpose of protecting our navigable rivers from the natural causes that operate to their injury, and of permitting the resumption of hydraulic mining without material injury to other interests, in accordance with the Gilbert decision and the enactments of the last session of our State Legislature. It is not believed that such an appropriation will be opposed by the valley farmers, since they will receive a direct and lasting benefit therefrom.

Second, the so-called Stewart mining bill, while containing many valuable amendments to the present Federal law relative to the acquisition and holding of mineral lands, contains also some provisions that would undoubtedly work grave hardships upon the mineral claimant. The Miners' Association at its recent meeting set forth clearly the wishes of the miner with reference to these matters, and a committee was appointed to draft a proper measure to be presented to Congress. The miner asks nothing but fair treatment at the hands of the Government and its officers. If I should locate a mining claim in the Sacramento valley in a well-recognized wheat-growing belt, I should expect, in a contest with an agricultural claimant, that the land in controversy would be presumed to be agricultural in character until the contrary was proven, and it is but fair and decent justice to indulge the same presumption as to the mineral character of land within a well-known and well-defined mineral belt.

Third, the rulings of the Commissioner of the General Land Office have been a source of constant annoyance to the miner in his efforts to obtain title to his property. An effort will be made to correct this serious evil.

Another matter which just now is of pressing and vital importance to the mining industry of this State is the necessity of a proper exhibition and illustration of the mineral wealth of California at the approaching Midwinter Fair. This was not neglected at the recent meeting of the

association, and will be properly looked after by a committee appointed for that purpose.

After the disasters and depressions of a decade, the miners find themselves once more united, buoyant and hopeful. Their respect for, and obedience to, the law, have challenged the admiration of the country, and the justness of their cause appeals to that sense of fairness and justice that is typical of the American people. So long as the miners of California keep up an energetic and active State organization, backed by wide-awake county associations, just so long will their cause receive that consideration to which it is so justly entitled, but which can be obtained only through united and persistent efforts.

I should feel that I was negligent in the performance of my duty as a miner did I not take this occasion to say, in behalf of the miners of California, that to Governor Markham, more than to any other one man, is due the change of sentiment that has swept over the State with reference to the mining industry. He was our friend when we needed a friend, a fact the miners of California will never forget. TIREY L. FORD.

Compromise or Nothing.

The silver repeal debate at Washington has resolved itself into a contest of physical endurance, and the silver men have altogether the best of the situation. While the repeal advocates are probably in a majority, they find it impossible under the traditions of the Senate to terminate the debate by cloture. In this case, the minority is active, stubborn and disposed to take every possible parliamentary advantage. The repeal men have resorted to a "continuous session" expedient, in hope of wearing out the patience of their opponents and forcing them to a vote; but it is not at all likely that the issue can be directly forced in that manner. The result will probably be an agreement of some sort, and agreement is compromise. Indeed, it is practically settled that unconditional repeal is dead; and the only question now is as to terms.

Various measures have been broached, but the true solution to the problem has probably not yet been suggested. Senator Squire of Washington has offered a bill that meets with some favor. It is in substance that the owner of bullion and product of mines or refineries in the United States may deposit it at any mint in an amount not less than $100 in value, to be coined into standard dollars of the present weight. There shall only be paid to the person depositing the bullion such number of dollars as are equal to the commercial value of the silver bullion on the day of deposit, the difference between the commercial value and the mint value to be retained by the Government as seigniorage. The deposits of bullion for coinage are not to exceed $2,000,000 per month, and when the number of silver dollars coined shall have reached the sum of $100,000,000, further coinage shall cease. The seigniorage is to be retained in the Treasury as a reserve fund for the purpose of maintaining the parity of every dollar issued under this Act. While it is not to be expected that an agreement will be reached in precisely this form, it may afford a basis upon which a compromise measure may be wrought.

The end is doubtless in sight, so far as the Senate is concerned. What the House will do is another question. It may reject wholly any suggestion of compromise by the Senate. But the alternative now seems to be either compromise or no legislation.

Slickens.

SHASTA COUNTY wants a local smelter. The output of refractory ores in that county is large, and it is argued that the investment would pay.

THE "burlap" process for saving fine gold is said to have been introduced on the Rio Grande gravel bars, and to be yielding a profit of $3.50 per day per man.

MINERS are said to be leaving Butte by the hundreds for South Africa. One week, recently, 400 tickets were sold to parties bound for the mining region of that distant country. The price of the tickets is $128.

LOUIS NAPOLEON BEAUREGARD, foreman of the Judson Works, died of cancer Oct. 3d. Mr. Beanregard was the inventor of the "C" spring, and his name appears in the Patent Office reports in over 30 patents of machinery.

THE Center Gravel-Mining Company at San Francisco has been incorporated. Capital stock $10,000, with H. J. McLerie, W. G. Roberts, C. A. Malm and A. H. Winn of San Francisco, and J. O. Whitney of Oakland as directors.

EVERY stamp mill at Gilpin county, Colorado, is said to be pounding ore. Every hole and shaft, too, which contains any ore that can be made to pay, has men in it at work. There is talk, too, of erecting a new mill for custom work, which will have 200 stamps.

THE directors of the Morning Star mine of Iowa Hill have just declared a dividend of $1 per share, aggregating $2400. The amount is somewhat less than the usual dividend, owing to extensive improvements being made at the mine, but the mine itself is even richer than ever, and bigger dividends may be looked for.

THE silver output of Arizona will exceed the output of gold by many hundred thousand dollars this year, says the Mohave *Miner*. The Territory, if admitted as a State, would cast her maiden vote in Congress in the interest of silver. The statement sent out that Arizona is favorable to gold mono-metallism is false as well as absurd.

NEARLY every shipment of treasure from Central America heretofore has been of silver. Monday the steamer San Jose, which arrived from Panama, had several entries of gold bullion or gold dust on her manifest. There were two packages of gold from La Libertad, amounting to $25,000, one from Corinto valued at $1230, and one from Tumaco worth $1650.

THE Home Mining Company, at Deer Creek, Nevada county, advertises that it will receive bids until Saturday, the 21st day of October, 1893, for sinking 100 feet of shaft on the Home mine. The shaft is to be 8x5 in the clear. Contractors are to furnish their own powder, candles and fuse. The company is to furnish the balance required for the work. Three shifts will be required.

THE union miners of Canyon Creek, Wallace, Idaho, have decided to go on with their strike and not accept the tender of the mine-owners for $3.50 per day for miners and $3 for carmen and shovelers. The Butte union, which has loaned the local unions considerable money, sent in delegates and demanded that the strike be carried on. The mine-owners say that they will put competent men to work as fast as they can get them.

THE San Juan Mining Company, to carry on business in California and Lower California, has incorporated with a subscribed capital stock of $24,000. The stockholders and the amount held by each are as follows: F. A. Schneider, Santa Clara county, $3375; H. W. Schramm, San Francisco, $3375; Jose G. Moraga and Jobentino Moraga of Santa Barbara county, and Charles Cranz Jr., William S. Cranz, F. F. Cranz and T. E. Gallup of San Francisco, $3000 each.

THE Juneau City *Mining Record* reports that placer mines have not done very well on the Yukon this season. At Franklin, Miller and Davis creeks the returns have been small. The *Record's* informant, a miner who has just returned, says: "As a rule the diggings in the Yukon are very low and will not average more than a bare living. I think there will be all of 100 men coming out this fall, some over the Summit and others down by St. Michael. Henkuk river is now the mining place. Mr. Bettles has started a trading post 600 miles up the river, but the diggings are 250 miles farther up still."

AN apparatus for blowing a whistle by air is being constructed at the Miners' Foundry for use at one of the mines in this district, says the Nevada *Transcript*. It consists of a large tank with a small and very sensitive whistle attached. Connected with the tank will be two pipes, one letting water into the tank, the other allowing it to be drawn off. The tank is air-tight. When the water is turned on the air is compressed and by means of a valve is conducted to the whistle, the pressure obtained being sufficient to produce a good blast on the whistle. The water is then drawn from the tank, and everything is ready to blow the whistle again.

THE manager of the Harqua Hala mine reports for August to the English directors: The mine throughout looks well, and promises to fully bear out the expectations predicted as a valuable dividend producer. The mill started work at 6 o'clock on the evening of the 11th with 15 stamps, and on the morning of the 12th we ran all the stamps till the morning of the 31st, when we shut down to examine the boilers, which were showing signs of mud accumulations. The mill ran 19 days and crushed 1875 tons; amalgam cleaned up, 252 pounds; approximate value, $25,000; approximate expenses, $7000; estimated profit for the month of August, $18,000. Tailings: I took four samples of tailings during the month and sent them to San Francisco for assay, with the following results: No. 1 contained $1.70 in gold; No. 2 contained $1.70 in gold; No. 3 contained $2.20 in gold; No. 4 contained $3.80 in gold; average, $2.35.

THE dynamite question has been a perpetual "thorn in the flesh" of the South African mining industry. A monopoly formerly had the sole right of importation, and it fleeced the companies by reason of the exorbitant price of the explosive imported under its provisions, and risked their workmen's lives by its bad quality. Now a still more thorough-going measure of the same sort is proposed. The Volksraad has sanctioned the concession of the sole right of selling dynamite to a company which will be bound to produce it in the republic. The price is to be £5 per case, as against £4 15s at which it has been obtainable since the recision of the former monopoly. The Johannesburg Chamber of Mines is very indignant in the matter, and has even been hinting at an uprising on the part of the mining population. The miners, however, seem to entertain some doubt as to the chamber's motives; at all events they repel any suggestion of revolution. As this session of the Volksraad has also resulted in an additional duty of 1d per pound on sulphuric acid, a tax which will probably mean $100,000 a year extra working expenses for the gold-mining companies—it cannot be said to have verified the President's liberal promises of more generous treatment.

Foundry Notes.

The Pelton Water Wheel Co. have recently sent a power plant to Mexico which has some features of unusual interest. The plant embraces two 67-inch three-nozzle Pelton wheels having a capacity of 700-horse power running under a head of 100 feet. This station is intended to operate a jute factory located at Barrio-Nuevo, in the State of Orizaba, some 60 miles inland from the port of Vera Cruz. These wheels are to be connected to four electric generators and the power transmitted to the factory, 1½ miles distant. No line or counter shafts are to be used, but every machine will be run by a separate motor varying from 1 to 20-horse power, as required. Pelton regulators are attached to the wheels, which will give a uniform speed under all variations of load. This is the first factory in the world on a large scale to be run exclusively by electricity with an entire absence of shafts and belt connections. This new departure will therefore be watched with the greatest interest.

The State Miners' Convention.

The annual convention of the State Miners' Association was held in this city Monday and Tuesday, October 9th and 10th. The attendance was satisfactory and results are likely to be important and for the permanent and substantial benefit of the miners. It was strictly a business session, proceedings being confined almost wholly to matters within the immediate view of the convention. Little time was devoted to oratory and generalities, and the Anti-Debris Association, which is generally present at miners' assemblies in the spirit or in the flesh, or both, escaped with bare mention. It is an ancient bugaboo whose shadow is rapidly vanishing. Its influence on the late convention extended only to the familiar matters of legislation and judicial decisions determined in the past. So far as the sentiment of the miners was expressed on the subject, it is not a factor to be seriously regarded for the future.

The chief events of the convention were the adoption of resolutions criticising in a specific manner the Stewart mining bill and asking Congress to appropriate $1,030,000 for the construction of Government impounding works upon the tributaries of the Sacramento and San Joaquin rivers, and the formulation of a bill therefore; the endorsement of the Midwinter fair, and the preparation of an elaborate mineral exhibit thereat; the speech of Judge Niles Searls and the speech of Ex-Senator Cross. Other matters of more or less importance came up for consideration and action.

The place of meeting was Pioneer hall, which had been arranged tastefully for the occasion. Silken banners were disposed in various places indicating the seating places of the delegations. Every mining county except Plumas was present by its delegates and the number of proxies was comparatively small. There were a number of spectators.

President Neff Opens the Convention:—In calling the convention to order the president spoke as follows: "The objects of this convention are fully set forth in the call which will be read to you, so I will not detain you with extended remarks. But I wish to congratulate you on the favorable auspices under which you meet this year. Three years ago the mining industry was flat on its back, and the miner had lost heart. He had nothing but his little cottage and his few acres, and was compelled to eke out a living from his patch of garden truck, His mine was closed and the future looked very black.

"Then in a happy moment some people thought of forming an association whose object should be to help the miner and harmonize the two great conflicting interests in the State. The association was formed, a convention held and a bill formulated. This bill was sent to Washington and a committee was sent to urge its passage through Congress.

"The bill was passed. It is now a matter of history. Though not altogether satisfactory to every miner, it is a big step in the direction of rehabilitating the mining industry, and has gone a long way toward solving the problem of how to open the mines without injuring the agricultural interests. The differences between the farmer and miner are now in the hands of an honest and fair commission. But it is necessary to have this bill changed in some minor particulars. It has been found that it needs further amendment to help out the small miner. We also desire an appropriation to carry out the provisions of the bill. These are some of the matters to come up for your consideration, but I will not enumerate them further, as the secretary will read the call for the convention, which sets them out in full."

Preliminary Work Begins.—The secretary then read the call for the convention, heretofore published in the MINING AND SCIENTIFIC PRESS.

J. A. Filcher of Placer county moved the appointment of a committee of seven on credentials. Carried.

Senator Ford of Sierra moved the appointment of a committee of fifteen on legislation, and that all matters relative to legislation be referred to the committee without debate.

This motion brought A. Burrows of Nevada to his feet. He objected to the motion. The size of the committee was too large, and he didn't like the way it was proposed to gag the convention by shutting off debate. Mr. Burrows explained his position in some detail.

Judge Fulweiler of Placer found it hard to believe that Mr. Ford intended to gag the convention. He suggested that debate would of course be permitted after the resolutions had been reported back from the committee.

Senator Ford explained that he had desired every part of the State to be represented on the committee, which was an important one, and that was why he placed the number at fifteen. Besides, it followed the precedent of previous conventions. There was no desire to introduce gag law. The design of the motion was simply to expedite business. Half a dozen resolutions on the same subject might be introduced and the convention might engage in an unprofitable discussion on all. Let the committee receive, digest and prepare them for the convention. Then debate would be proper and desirable.

Mr. Filcher also helped to remove Mr. Burrows' objections, and the latter gentleman finally acquiesced and the original motion carried.

Ex-Senator C. W. Cross moved the appointment of a committee of five on order of business, and Julian Sonntag, at the Chair's suggestion, moved the appointment of a committee on ways and means, stating the necessity for raising money to defray expenses.

Slickens as a Fertilizer.—At this point a ripple of amusement was created by the presentation to the convention of an enormous tomato raised on slickens, and a letter from E. J. Rector of Nevada City. "This," said the writer, "is but one of the many evidences that slickens is most valuable as a fertilizer." The slickens was from the old Manzanita mine, and the tomato weighed two pounds and was seventeen inches in circumference.

The standing committees (the names in full appear in another part of this report) were then announced by the Chair.

Recess till afternoon was then taken, to give the committee on credentials time to examine the list of delegates. It made its report after the opening of the afternoon session.

Election of Officers.—The nomination of officers being then in order, John McMurray of Trinity moved the unanimous election of Jacob H. Neff of Placer for president. The motion was carried amid great applause.

Mr. McMurray nominated Samuel K. Thornton of San Francisco

for vice-president; Richard I. Thomas of Nevada, in a fervid speech, nominated W. C. Ralston, the incumbent, for secretary; W. W. Rodehaver of Placer was nominated for assistant secretary by R. F. Burns of Placer; Julian Sonntag of San Francisco was nominated for treasurer; and all the nominations were accepted by the convention, which voted by acclamation.

On motion of J. M. Fulweiler of Placer, the constitution was amended so as to make each county's representation on the Executive Committee two instead of one.

The Committee on Ways and Means made a report recommending that each county association be assessed in a sum equal to $1 for each enrolled member of the association, and that $2 be assessed against each delegate to the convention. It was explained that the first assessment was not against individual members in the counties, but against the associations as a whole. Adopted.

Reports of officers were read.

The Midwinter Fair.—The president then introduced Mr. M. H. de Young, director-general of the Midwinter Fair, who, in a speech of some length, explained the scope of the fair and urged the miners to make an adequate exhibit. The central idea of Mr. de Young's address was that quantity was more to be desired than quality. A ton of ore in bulk makes a greater impression upon a visitor than a small specimen, however rich.

On motion of Samuel J. Hendy, it was decided to appoint a committee of three from each county to collect specimens and arrange for a fine mining exhibit.

A South African in California.—At the close of Mr. de Young's speech, Dr. Mathews of South Africa was invited to address the assembled mining men. He said that he did not claim to be a practical miner, but he had lived for 25 years in the Transvaal of South Africa, and so knew well of what he talked. Twenty years ago an expert returned to London from South Africa and said there were no diamonds in that country. Since then that country has produced £325,000,000 worth of diamonds, and they have been placed on the markets of the world. "I now want to assure you," said he, "that Africa is the future gold-mining country of the world. The mines there are enormously rich, and are now producing at the rate of 125,000 ounces a month. I do not want to disparage the golden wealth of California, but as miners I know you are interested in mining wherever it is carried on. I lectured in Chicago on the gold mines of Africa, and intend doing so here, and I assure you that the great dark continent conceals wealth of which no man dreams, and of which only a portion has been uncovered.

"This State should, in my opinion, do its utmost at the coming Midwinter Fair to display to the world its mineral wealth, and I can but be convinced of the great good it will do you."

Mr. Mathews thanked the convention briefly and made way for Prof. Christy, who was summoned to the platform by Chairman Neff. Prof. Christy of the State University, though taken by surprise, said he was anxious to re-enforce the remarks of Mr. de Young with regard to the need of making a fine exposition of the mineral wealth of this State at the Midwinter Fair. At some length he told about the workings of the mining department of the State University, which has graduated more students than any similar institution in the United States with two exceptions. The professor also spoke of the deposit of debris by the rivers from the hydraulic mines, and declared that the question of controlling the debris was an engineering problem which had been successfully solved.

The convention shortly afterward adjourned until Tuesday at 9:30.

SECOND DAY.

The convention was slow in assembling the second day. The Committee on Resolutions had had a long siege the night before, and the members were naturally in no hurry to begin work the next day. At 10 o'clock the gavel dropped, and the business of the session began. The first really important business was the appointment of the Executive Committee. The name of each county was called, and the men were promptly named.

A dispatch from Thomas R. Bard to John B. Treadwell was read by the chairman: The message, dated at Santa Paula, Cal., requested Mr. Treadwell to represent the petroleum interests of the State at the convention. On motion of J. M. Walling of Nevada City Mr. Treadwell was seated as a delegate from Ventura county.

Several resolutions were here introduced by Mr. Charles G. Yale and others and were unanimously adopted.

Mr. Burrows Defends Senator Stewart.—The report of the Committee on Legislation was then called for and was read by Chairman Tirey L. Ford. When the reading was finished, A. Burrows of Nevada City, who had already pretty well established himself as the combative spirit of the convention, began a long speech against the report, and particularly that part criticising the Stewart bill. "I don't believe in all these strictures on the Stewart bill," declared Mr. Burrows. "The only friend of the miners in the upper house of Congress, except Perkins, is Stewart. When the hydraulic mining question came up he championed their cause." Mr. Burrows then told how Senator Stewart had written to various mining lawyers and others, asking for suggestions for his bill, and how one proposed by himself had been cheerfully incorporated. "This convention should not undertake the wholesale criticism of the bill," he continued. "There are some objectionable features, I admit. For instance, the area of a placer claim should not be restricted to forty acres, but it ought to be 160. If we attempt to change the whole thing, we will get nothing." One of the good features of the bill defended by Mr. Burrows was the clause against fraudulent relocations. It was favorable to the bona fide development of claims. Stewart declares that claims upon which no assessment work has been done shall be relocated on midnight of December 31 each year by the same persons. He also defended the provision about giving notice in case of contest.

Col. Keown of Placer here arose and interrupted Mr. Burrows, criticising him for taking up the time of the convention by his objections, when he was a member of the Committee on Legislation and had not even taken the trouble to attend the session of the committee and state his objections there.

Mr. Burrows said he had been unable to attend, and continued, declaring the bill was good for the quartz miner. "Now," he urged, "don't run amuck against the bill. Let us suggest improvements and they will be adopted." Mr. Burrows agreed with others of the convention that the rulings of the Land Department were open to severe criticism. He cited an instance of the action of a clerk, acting in the name of the Commissioner of the Land Department, who had put him to an infinite amount of trouble in making his proofs on a claim upon which $25,000 had been expended in bona fide improvements. "Why," he cried, "some of these fellows don't know the difference between a gold mine and a sand lot. The fault with these fellows is that they know so many 'things that ain't so.'"

Judge Walling, of Nevada, believed, he said, that no intelligent man could examine the Stewart bill without noticing therein the continuous and additional limitations upon the rights of the miners. This bill is not in Congress now. It is dead. What the miner wants is an application, in the rulings of the Land Department, of the methods by which the miner himself determines if the land is mineral.

Senator Ford said one important point was made in the proposed amendments to the Stewart bill in the addition of the words "and always has been" in stating that land was mineral land. He said the miner frequently ran up against the railroad in attempting to secure his patent. Though his claim might be paying well at the time of application for the patent, the railroad would say, "but was there any mineral showing on it in 1861?" or some other date. So it was necessary to have a provision that the land once demonstrated to be mineral-bearing had always been mineral land.

Then the report of the committee was adopted by an almost unanimous vote, Mr. Burrows casting the only vote in the negative.

The Midwinter Fair Exhibit.—Immediately Mr. Filcher called up the matter of the mining exhibit at the Midwinter Fair, suggesting that the convention decide that the arranging of the exhibit be placed in the hands of an executive committee of five appointed from San Francisco assisted by three members appointed by each mining county. He said it was necessary to "get a move on" as the fair was to open on January 1st, and he moved to reconsider the vote by which the Midwinter Fair proposition carried the day before.

Mr. Searls of Nevada called upon State Mineralogist Crawford to give the convention some ideas on the subject, but Mr. Crawford said he had given the matter no thought, though the State Mining Bureau would do everything possible to make the exhibit a success.

Mr. Filcher's motion to reconsider prevailed, and after some hair-splitting as to methods of appointment the president was authorized to appoint a Central Committee of five from San Francisco and Alameda counties to act with three members selected by the delegates from each mining county to form a Committee on Mining Exhibits.

Professor S. B. Christy said the State University would do everything possible to make the exhibit a notable and gratifying success.

On motion of Judge Walling of Nevada the following committee of three was appointed to draft a proper mining bill for presentation to Congress: Senator Tirey L. Ford, E. A. Belcher and Charles G. Yale.

To Endorse Caminetti.—Mr. Tregidgo of Nevada then introduced a resolution reciting the need of gold from mines, and winding up by commending the work of Congressman Caminetti.

Judge Walling said the resolution was mere buncombe and would not be a credit to the association, though he was not opposed to the sentiment contained in it. On motion of Julian Sonntag the resolution, which threatened to bring on a sharp fight, was laid on the table and the convention took a recess for luncheon.

Upon reconvening Judge Walling moved to take the resolution from the table and the motion prevailed. Then Judge Walling offered a general resolution as a substitute. [The text of both will be found in another part of this report.]

Mr. Tregidgo accepted the amendment, saying he might have been over-enthusiastic in attempting to do justice to any one who had helped the miners in their fight, but if this was buncombe he thought the miners would like more of it. He told of the money he had spent in developing the mines of Nevada county and his work in behalf of the association.

Judge Searls' Address.—After the adoption of the resolution, Judge Niles Searls arose to address the assemblage. He said:

"I don't know whether I ought to have anything to say in this convention ['Oh, yes, you ought, Judge,' interrupted the president, amid cheers]. I occupy a position [Court Commissioner of the Supreme Court] which is supposed to remove me from all the feelings, excitements and prejudices that surround the cause of the miner. But I cannot refrain from saying what I have to say. I am extremely desirous that harmony be promoted among the miners here assembled. At the first convention, nearly two years ago, from which I was detained by illness, it seemed that the farmers were overflowing with the milk of human kindness. I was sick in bed, but so strong was this feeling made manifest by our friends that I was inclined to come down and start in the dairy business. I had the honor to be one of the representatives of the California miners sent to Washington by that convention to advance their interests. I was informed that all was harmony between the farmers and miners. Everything had been arranged and the proposed legislation agreed on. I was told to go on to Washington and meet Devlin and Ohleyer and to formulate a bill in the interests of all concerned. We reached Washington after Devlin and Ohleyer, too late for consultation and too late to appear before the River and Harbor Committee. Only members of Congress were at that time allowed to address the committee; but, through the influence of Congressman Caminetti, we were allowed to appear before the committee. I was informed afterward that, in consequence of the speech of one of the representatives, the committee decided to change the recommendation for the improvement of the Sacramento from $50,000 to $150,000. [The Judge then told of the efforts to prepare a bill upon which the various California interests would agree.] Mr. Devlin stated his objection to the measure fairly and squarely, but Ohleyer said: 'If God Almighty were to come down here and present a bill in favor of hydraulic mining I would not accept it.' There it was fight, and fight we did. We worked around Congress in season and out of season for months as I never worked before, and as I never will again. We did not get all we wanted, but we did accomplish the recognition of the right of the hydraulic miner to live and follow his pursuit. Don't you think that was much? Well, it was. It was a great deal. When this Government recognizes the right of one part of its people to live and prosper, it will defend and advance that interest at all times and under all circumstances. We have made a start, and it will, I think, result in such legislation as will bring about the triumphant success of the hydraulic miner. We do not propose to injure the farmer. As a lawyer, I know we couldn't if we would. We recognize and appreciate the position of the farmers, even though we suspect that some of their representatives get a salary for thinking as they do.

"As to the Caminetti law, we have not accomplished anything in comparison to what we will. We have got an inch now, and when you've got an inch in legislation you can hold onto it till you get a foot. But it will take time. I'll be dead and gone before hydraulic mining is resumed to its former measure. But that time is coming, just the same. To-day mines will start in one place, to-morrow in another, and finally it will be found it can be resumed everywhere without detriment to our neighbors in the valley; and finally universal harmony will prevail." The judge considered the passage of the Walling resolution a recognition of his labors.

President Neff endorsed what Judge Searles said about the labors of the committee in Washington. "Their opportune arrival," he said, "saved everything. We now have a legal standing in court and we are recognized by the United States Government; and not the least who assisted in this service was the honorable gentleman who has just addressed the convention." The president then took occasion to speak in warm terms of Mr. Alf. Tregidgo and his services for the miner.

Chinese Miners in California.—Mr. Charles G. Yale read a statement, compiled from mint statistics, as to the output of small mines and Chinese mines in this State. He presented the following figures for 1892, which, he said, were approximately correct:

Counties.	Small Mines.	Chinese Mines.
Amador	$ 98,600	$ 9,200
Butte	69,612	45,000
Calaveras	76,000	15,585
El Dorado	124,405	57,000
Fresno	100,900	7,000
Humboldt	42,800	16,000
Inyo	17,000	.....
Kern	72,000	16,600
Los Angeles	6,000	.....
Mariposa	.....	.....
Mono	35,000	8,000
Nevada	105,336	92,049
Placer	45,640	152,875
Plumas	96,000	67,000
Sacramento	61,650	58,850
Shasta	35,000	28,000
Sierra	126,700	73,000
Siskiyou	288,990	216,202
Trinity	96,000	136,000
Tulare	.....	.....
Tuolumne	865,000	8,000
Yuba	15,000	5,700
Totals	$1,883,683	$1,042,110
Total gold in State		$2,671,900

Senator Cross' Address.—Ex-Senator Cross spoke of the benefits derived from the Trans-Mississippi Congress, and eloquently extolled the Caminetti law. He also paid a tribute to the United States Debris Commissioners, telling of their wide experience and great engineering achievements. He said the commission had not as yet refused any application to mine after impounding dams had been constructed, and that the members were earnest in their investigations. He told of an instance that day where the commission had granted one of his clients leave to build a dam and go ahead with their hydraulic mining. He said the small mine-owner could operate under the Caminetti bill as well as the great mining corporations. He urged the miners to see to it that they were well represented at the next meeting of the Trans-Mississippi Congress, which will be held in this city next February, as that congress would, by its indorsement of mining, do the miner an immense amount of good.

Replying to a question by C. Runckel of Placer, Senator Cross said he could not explain in a few words what would be the course, if after having obtained permission to construct a dam and go ahead with hydraulicking, the miner were enjoined by the State courts. But he said the miner would have legal recognition, the farmer was committed to the Caminetti bill through his representatives, the bill was a law of the United States, and if a few counties attempted to rise up against that law the law would be upheld even were it necessary to call out the militia, the regular army and the volunteers.

There being no further business to come before the convention, three hearty cheers were given, the band played and President Neff announced an adjournment sine die.

ENDORSING THE MIDWINTER FAIR.

WHEREAS, The Miners' Convention is impressed with the importance to California of the success of the Midwinter Fair; and whereas, from the kind explanation of Mr. de Young, it appears to the convention that a large and well-chosen mining exhibit will add materially to the success of such fair and at the same time illustrate the marvelous mineral wealth of our State; and whereas we fully realize that a State exhibit of minerals, upon a scale commensurate with the resources of California, will add a renewed impetus to the development of her mines; therefore be it

Resolved, That the Miners' Convention pledges its loyal support to the Midwinter Fair, and will by every effort conduce to such a mineral exhibit thereat as shall give to the world a fitting sample of the boundless mineral wealth of the Golden State.

Resolved, That the united effort of the mining community be invoked to aid in the collection of material going to make up an exhibit which in variety and volume shall be worthy of the grand occasion which it is confidently believed will crown the efforts now in progress on behalf of the fair.

Resolved, That the thanks of this convention are due and are hereby tendered to M. H. de Young for his kind explanation to us of the progress being made, and the certain hope of a grand success in such Midwinter Fair.

Adopted.

REPORT OF COMMITTEE ON LEGISLATION.

To the President and Members of the California Miners' Association.—GENTLEMEN: Your Committee on Legislation beg leave to report the following:

1.

We recommend the adoption of the following resolutions concerning the so-called "Stewart Mining Bill," which bill has for its purpose the amending of certain sections of the revised statutes of the United States, relative to the acquisition of title to mining lands:

Resolved, That this association is opposed to any changes in Section 2324 of the revised statutes of the United States, except the following: Strike out the words, "a patent," and insert in lieu

thereof the words "payment of the purchase money and a certificate of entry," in accordance with the Stewart amendment.

Also strike out the following words in the Stewart amendment: "But no re-location of a claim by a person who has already located such a claim, and failed to comply with the conditions of this act in performing work for making improvements, shall be valid prior to such resumption and continuance of work upon such claim."

Resolved, That this association is opposed to any changes in Section 2325 of the revised statutes.

Resolved, That this association is opposed to the Stewart amendment to Section 2325 of the revised statutes, relative to giving a notice in matters of contest, as to the mineral or agricultural character of lands, and desires that the law in that regard shall remain as at present.

Resolved, That it is the sense of this convention that the provisos of Section 2325 of the revised statutes, as contained in the Stewart amendments, should read as follows: "Provided that the presence of rock in place bearing gold, silver, cinnabar, petroleum or other valuable mineral shall be regarded as presumptive evidence that the land containing the same is and always has been mineral in character. And provided further, that in investigating the character of land, with a view to ascertaining whether it is more valuable for mineral than agricultural, evidence may be taken of the mineral discovered or developed adjacent to such land, proof of which shall be presumptive evidence that the land in question is mineral in character. And provided further, that wherever land is proven to be within a well-defined mineral belt, such land shall be deemed, presumed and taken to be and to have been mineral land unless the contrary is proven.

Resolved, That it is the sense of this convention that a new section should be added to the federal mining laws, as follows, to wit:

That the officers of the land department of the Government, in construing the provisions of the law relative to the acquisition of the title of the Government to its mineral lands by its citizens, shall construe and apply the same with great liberality, with a view to aid the applicant in procuring said titles, and that the rules and regulations prescribed by said department for its government and that of its officers in disposing of said lands shall be so formulated and administered as to assist the Government in disposing of said lands to bona fide applicants, and not so as to impede said sales or impose onerous burdens on applicants.

II.

Your committee further recommends that the following bill be presented to Congress and its passage urged, as a means for the better carrying out of the provisions of the present so-called Caminetti Act:

An Act appropriating money for the construction of works to impound mining debris and thereby to protect the navigable streams of California.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress Assembled:

Sec. 1. That there is hereby appropriated, out of any money in the treasury not otherwise appropriated, the sum of one million and thirty thousand dollars, which sum shall be immediately available, and shall be expended under the direction of the Secretary of War, in accordance with the plans, specifications and recommendations of the California Debris Commission appointed under the Act of Congress, entitled "An Act to create the California Debris Commission and Regulate Hydraulic Mining in the State of California," approved March 1, 1893, for the purpose of constructing works for the restraining and impounding of mining debris upon the tributaries of the Sacramento and San Joaquin rivers in California, and the branches of such tributaries.

Sec. 2. Whenever any such works for the restraining and impounding of mining debris shall have been constructed out of such appropriation, or shall have reached such a stage as, in the opinion of said Commission, it shall be safe to use the same, it shall be lawful for said Commission to make the order provided for in Section 13 of said Act, upon proceedings being first had and taken in accordance with the provisions of Sections 9, 10, 11 and 12 of said Act; but, in such cases, the owners of the mines affected by said orders shall not be bound by the proviso to said Section 13 of said Act, nor by the provisions contained in Section 16 thereof.

Sec. 3. The said Commission shall also have power to make the order provided for in Section 13 of said Act as to any mine or mines, whenever it shall appear to the satisfaction of said Commission that no impounding works are necessary (other than the means already provided by nature) to protect from material injury the navigable streams mentioned in said Act and the lands adjacent thereto, upon proceedings had in accordance with Sections 9, 10 and 12 of said Act.

The resolutions were adopted as read.

AN APPEAL TO CONGRESS.

WHEREAS, There is a scarcity of gold in circulation in the United States, which has been caused by unjust legislation in suspending the production of that precious metal in California, wherein it is abundant and where its production was the principal business of the inhabitants of this great State, having produced in the neighborhood of $1,500,000 in gold coin, and contributed largely in sustaining our glorious Union; and, realizing the fact to-day that if its extraction by the hydraulic process was injurious to the agricultural interests of certain parts of the State, it was because the National Government did not make adequate appropriations for the preservation of the navigable streams of the State over which it had sole control, thereby aiding and abetting the production of gold and protecting the agricultural lands of the valleys, at the same time beautifying the Sacramento and Feather rivers; therefore, be it

Resolved, That whatever appropriation shall be made by the River and Harbor Committee for the purpose of dredging and rendering navigable the Sacramento and Feather rivers will be appreciated by the Miners' Association of the State of California; and a vote of thanks be teodered to the Hon. A. Caminetti—a member of that committee— for his untiring zeal and energy in the cause, to encourage him in his good work for the benefit of his constituents, which acknowledgment of his services shall be telegraphed to him forthwith.

This resolution was the subject of criticism, and it was laid on the table and the following substituted:

WHEREAS, There is a scarcity of gold in the United States, caused in part by the fact that hydraulic mining has been suppressed in the State of California, thus reducing the annual production of gold by many millions; and

Whereas, The navigable waters of this State and their protection are wholly under the control of the General Government, and it is the duty of Congress to provide liberally for maintaining the navigability thereof; and

Whereas, Congress has in the past failed to make such provision therefor as the importance of such streams render imperative; and

Whereas, Such failure in the past has resulted disastrously to the hydraulic mining industry of this State; therefore be it

Resolved, That we consider it the imperative duty of Congress to provide for the improvement and protection of the navigable waters by liberal appropriations, thus subserving the double purpose of maintaining said waters for the benefit of our whole people, and at the same time of assisting the miners in the prosecution of a legitimate industry, and any appropriation made therefor will be appreciated by the miners of California.

Resolved, That a vote of thanks is hereby tendered to each and every one of our Senators and Representatives in Congress who have in any manner assisted the miners of this State in their attempts to rehabilitate the industry of hydraulic mining.

Adopted.

APPRECIATION OF THE PRESS.

The California Miners' Association recognizes the valuable assistance it has received from the press of San Francisco and the interior in the effort to arouse increased interest in the gold-mining industry of California. Without this voluntary assistance from the newspapers of the State, it would have been impossible for the miners individually, in the association, to accomplish anything in this direction. The miners have been given every opportunity to plead their cause, so that it is now better understood by the public. Recognition has been obtained for the mining industry of California in the legislature and Congress, and this, we acknowledge with gratitude, has been mainly due to the attitude of the press toward the miners' movement. We have not only been accorded a fair and just hearing, but voluntary advocates have championed our cause and aided us in our efforts. To the press the miners of California are under the greatest of obligations, and it is but just to say, notwithstanding these many favors, that the California Miners' Association has never been called upon to pay, and never has paid, one dollar to any newspaper in the State, or out of it, for championing its cause.

Adopted.

THANKS TO THE BOARD OF TRADE.

The State Mining Convention acknowledges with gratitude the valuable assistance rendered the California Miners' Association by the San Francisco Board of Trade, which, through its exceptionally strong financial and moral support, has greatly advanced the mining industry of the State. It is particularly gratifying that such support comes from a representative body of merchants and business men of the metropolis of the Pacific Coast, since it is evidence of a general desire on the part of the public to encourage the miners and enable them to increase the gold yield of California.

Adopted.

THE SECRETARY'S REPORT.

Following the routine of business the Secretary's annual report was next read, and though it showed no very extensive cash balance on hand it was still accepted as eminently satisfactory and passed upon as such. The report in detail is as follows:

RECEIPTS.

Cash on hand, per statement Nov. 15, 1892	$185 14
Collections at convention, Nov., 1892	505 50
Sale of tickets for banquet, 1892	300 00
San Francisco	2,337 00
Placer county	256 70
Nevada county	250 00
Yuba county	100 00
Sierra county	100 00
Butte county	17 50
State Association certificates	19 00
	$4,070 84

EXPENDITURES.

Palace Hotel banquet, 1892	$400 00	
Headquarters and band	111 00

Assemblyman R. I. Thomas of Nevada, Chairman,

A. Tregidgo of Nevada, J. W. C. Maxwell of Tuolumne,
Prof. S. B. Christy of Amador, Warden W. E. Hale of Alameda.

How to Build Good Roads.

IN TWO PARTS—PART II.

[The following paper on how to build good roads, and what are the best and most economic roads, was written for the late California Road Convention by W. E. McClintock, C. E., of the Massachusetts Highway Commission.]

GRADES OF ROADS.

Many of the older roads of our country were laid out with grades far in excess of what should have been allowed. When the abutting property had been improved to any great extent, these hills cannot be reduced without great cost for damages, in addition to the great outlay for surfacing. In such cases the roadway will have to be improved on practically the old grade. If this should exceed five or six feet to the hundred, the wear from surface water will be great and much difficulty will be experienced in obtaining a road which will quickly divert the water into the side gutters without producing ruts or gulleys. If the natural soil be sandy, it can be covered with a thin layer (from four to six inches thick) of clay or sandy clay, having a crown of about one inch to the foot. On this clay lay a coating of fairly coarse gravel about two inches thick. Under the action of rain and traffic the gravel will be gradually worked into the clay, until a compact, even mixture is had, which will withstand the wash of water very well. Ruts will work ruin to any hill road. Therefore, as the ruts begin to show in a new road they should be filled in by moving the surplus material at the sides into them.

THE BROKEN-STONE ROAD THE BEST.

Unquestionably, the most economical road to build is one made of broken stone, if the stone can be found at a reasonable distance. It is a prevailing belief amongst men with no experience that any kind of stone is suited to road building, and that it may be applied in any manner.

The same custom prevailed before Macadam's time; and then, as well as now, there were many failures from this cause, and an immense waste of money.

If we recall what has already been said about the roadway constituting a roof over the foundation, we can readily see that large stones thrown at random into a wet soil will not lie close together; the mud in which they rest will be pressed upward by the weight of the superincumbent material until the stones cease to be of value on account of the mass of mud on top.

TOP AND BOTTOM STONE.

On the other hand, if the stones at the bottom be large and carefully laid to practically cover the ground, leaving only small spaces, and if these spaces be filled as far as possible by smaller stones, then a pavement is provided through which the mud cannot press upward, and the stones will remain where they are first placed, while the road will be good and durable. These large stones will afford not only a good foundation, but the small interspaces will act as an underdrain to the roadway. It is to be borne in mind that under such conditions free outlet must be furnished, or the result will be the reverse of what was expected, as the water will stand about the stone and soften the ground so as to render it unfit for a foundation. Over the top of a foundation so prepared may be laid either gravel, as before described, or broken stone. If broken stone is to be used, it should be laid on in layers, with fragments of nearly equal sizes, the larger bits on the bottom and the smaller ones on top.

THE SUBSTRUCTURE STONE.

What is usually used for such purposes is stone at the bottom, which has passed through a 2½-inch screen and not through a one-inch. On this is placed a layer which has passed through a one-inch screen and not through a quarter or three-eighths-inch screen. The whole surface is then covered by a layer of fine screenings about one inch thick, which have passed through a quarter or three-eighths-inch screen. This stone should be thoroughly compacted by a heavy roller, each layer by itself, before the next layer is spread on. The dust would better be watered as well as rolled, so as to insure its being worked in to fill all the interspaces in the larger stone. The fragments of stone should be brought as close together as their shapes will permit.

A STONE ROADWAY.

When this is done the bulk of the roadway will be of stone, while but a small amount of dust or "binder" will need to be used. A road built in this manner will shed water and at the same time bear up a loaded wagon without being rutted or wearing uneven. The small stone on top will be slowly crushed beneath the wheels of passing wagons and furnish a constant supply of fresh binding material for the larger fragments beneath, thus preventing their being kicked out.

To recapitulate: First make a firm bed; lay the stone on this in nearly equal sized fragments; roll each layer, and use stone dust or good gravel for a binder, with water enough to wash the dust into the voids. Don't use any clay or loam with the stone, as either material absorbs water and destroys the bond of the stone, while it also makes dust in dry weather and mud in wet. Its use may give apparently quicker results, but it will prove a sure element of destruction. On sandy or gravely soil there need not be any large stone at the bottom, nor so much depth of any kind of stone. The smaller broken stone may be laid directly on such material to a depth of four or six inches with excellent results. The depth will depend on the expected volume of traffic over the proposed roadway.

WIDTH OF ROADS—MACADAM.

The width of a road should be regulated by the traffic. Fifteen or sixteen feet of finished way is usually sufficient for a country road, which may be increased through villages to 20 or 25 feet, finishing outside of the gravel or stone with the natural soil.

In selecting stone for a macadam road, that which is hard and tough is the best. Trap work meets all the requirements better than any other. There are several kinds of hornblendic granite which give good results. Some of the conglomerates, amygdaloids and felsites are suitable. None of the slates, schists or sandstones are of any special value; they are too soft and are soon converted into mud. The micaceous granites make but poor road material. The poorest of these, however, are far better than mud, and can be used if no better are available.

It may often be profitable to have a geologist look over the ground if no good material appears in sight. In our own experience we have known of towns using an inferior rock when a first-class one could just as easily be had, if the road officers had only known where to find it.

We have attempted to outline a few general principles which should guide one in building roads.

SELECTION OF MEN TO BUILD ROADS.

There still remains a very important point which we have not touched on, and that is the selection of men who shall have charge of such work. If we wish the services of a doctor or lawyer, we select that man whose training and experience have been such as will give us confidence in his judgment. We should not think of going to a doctor to build us a house or a lawyer to instruct us in caring for our farm. Neither should we call in the lawyer, the doctor or the farmer to build and take care of our roads. There is no more sense in one proposition than in the other. The art of road-building is one that can only be attained by experience. A man who is to be intrusted with such work should be honest and firm, capable of handling men and teams; and in addition to this, he should be instructed in road work and made familiar with methods. Most towns think they are too poor to afford instructions of this kind to the road officers, but such economy is of the kind "which saveth at the spigot while wasting at the bung."

WASTING MONEY.

As a rule, most of the road money is wasted in a vain attempt to do too much, and in building without any knowledge of methods or materials.

The older countries of Europe passed through just such an epoch as we are now passing through, and came out into the light nearly a hundred years ago. Nothing was done of any value until the old system was abandoned and a new one adopted. The old system was like our present one; the new system placed trained men in charge of the highways, and as a result it is the exception to find poor roads while the money outlay has been in many cases far less.

INSTRUCT THE BUILDERS.

We may select the best available local men to supervise our road-building, provided we furnish suitable men to instruct and guide them. A careful study of the whole subject seems to indicate that such instruction may be obtained through a State commission with advisory powers.

Letter from South Africa.

In May last C. C. Perkins, who built the Tacoma smelter, left for the gold fields in South Africa, fully determined at the age of 68 to recover his lost fortunes in a foreign land. How well he is pleased with the country is explained in a private letter received from him by a friend in Seattle. The letter bears date Johannesburg, in South Africa Republic, August 9, 1893. He says:

"I have been here seven weeks and am in love with the country, which is blessed with a climate similar to that of southern California, with the difference that it is not quite so warm and the nights are somewhat cooler. It is organized under a republican form of government, progressive and prosperous. The chief city is Johannesburg, with a population of about 40,000.

"Regarding the mines, the mineral is formed in reefs or ledges, as we call them, and these ledges are about forty miles long on level ground, over which a carriage can easily be driven from one end to the other. There are three distinct reefs, in reality, the main one of which is from six to ten feet in width, and pays from four to seven pennyweights to the ton. The north reef is from two to three feet wide, paying sixteen pennyweights, while the south reef is only from ten to twelve inches and pays from two to four ounces of gold to the ton. They save about 60 per cent on the plates, while the sulphurets are taken out and put through chlorination works, then the cyanide process is used on the tailings. Ninety-two per cent of the assay value of the ore is thus saved.

"The formation is a sedimentary sandstone, formed on a level, then tilted to an angle of thirty to forty degrees. The reefs are conglomerate, not quartz, and crushes very easily. At Boeherton and other places there are ledges of quartz like those in America, but they are pockety.

"The mines are worked principally by Kaffirs, who are paid 75 cents a day. White men boss or superintend these cheap African laborers.

"There are 3000 stamps running successfully on this ore, while more mills are being constructed. I have no definite information as to the output of these mines, but should judge it was very large.

"This country suits me better than America, and I shall stay with it."

The Noble Ruling.

TO THE EDITOR:—In the PRESS of Sept. 23d Mr. John Dare Emersley dares to criticise a ruling of our ex-Secretary of the Interior John W. Noble for canceling the patent of J. F. Bigelow to two mining claims in Marysville district.

I have mislaid my PRESS of Jan. 14th and am not able to refer to it; but, if my memory serves me right, our friend Emersley did not fully digest the decision of Secretary Noble. My understanding of the ruling was, and still is, that two locations, of 1500 feet each, had been made from one discovery shaft, the end line of each claim running through the center of the one discovery shaft. If I am correct in my understanding of the ruling, this is certainly good law as well as justice; for, if this were allowed, all mining locations could be made 3000 feet in length.

As Mr. Emersley says, "our mining law is liberal to the prospector;" but he does not say, what is also very true, that very few prospectors are satisfied with the liberality of the mining laws. They are too greedy for their own good. The labor they expend upon their several locations, if concentrated upon one in good development work, would often give them a fortune; while the work as usually done by scratching the surface and locating many new claims keeps them poor and open to the charge of defrauding the Government, that is so liberal in its mining laws, by holding numerous claims without having performed the necessary assessment work. There is often cause, also, for "jumping" the rulings of our Washington officials, and the writer is not exempt from fault-finding, but in the above instance we think the fault lay with the locator.

B. M. NEWCOMB.

Oat Hill, Napa Co., Cal., Sept. 27, 1893.

Highest Mountain in North America.

The much vexed and much disputed question of the loftiest mountain on the North American continent has at last been settled. John Partridge, secretary of the Geographical Society of the Pacific, has received a letter from the chief of the United States Coast and Geodetic Survey, Washington, D. C., stating that Mt. Orizaba, in Mexico, is the highest.

Mt. St. Elias, Alaska, has for many years past been considered the highest, but Orizaba has been proved to be the higher by 299 feet. The exact figures, as forwarded to Secretary Partridge, are: Mt. Orizaba, 18,314 feet; Mt. St. Elias, 18,015. "These figures," said Assistant Secretary Trenor, "are authentic; and doubtless it will interest every one to know that the question has been settled by so undoubted an authority."

A PROSPECTOR named Taylor, of Idaho, thinks he has solved the flour-gold problem, so vexatious to placer miners. He has invented an appliance, consisting chiefly of a sluice-box, in the bottom of which is a row of overlapping boards. These boards, prior to being placed in the sluice, are smeared with white lead and then sprinkled with sand. Over this surface the water runs in a slow stream. The gravel reaches the sluice through a grizzly. The gold and sand settle to the bottom and are caught on the sanded boards. After the sand and gold has accumulated it is taken up and amalgamated in a quicksilver batch. This device, it is said, can be worked at a cost of about $10 per day, and, while not perfect, it is credited with the best work yet done on the Snake river placers, where the amount of flour gold is very large. It is said that Taylor's machine has been in use all summer and cleaned up from $30 to $50 per day.

MacArthur-Forrest Process
UNITED STATES PATENTS CONTROLLED BY
The Gold and Silver Extraction, M. & M Co.

DENVER WORKS: On the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Among the mills that have adopted the process are: The Denver Mill, Denver, Colo.; The Livingstone Gold Mining Co., Boulder Co., Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; The San Juan Gold M. & M. Co., Silverton, Colo.; The MercurGold Mining Co., Fairfield, Utah; The Union Mills Co., Tuscarora, Elko Co., Nev.; The Creighton Mining & Milling Co., Creighton, Cherokee Co., Georgia; The Morstock Mine, Montgomery Co., N. C.

Experimental tests and carloads of ore treated on request.

Cheapest and surest process yet discovered for treating many kinds of refractory ores.

Full information and literature furnished by
T. L. WISWALL,
Gen. Mgr. and Secretary,
Lock Box 1606. DENVER, COLO.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is heavily illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cash, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 184 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.
A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."
A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
BY J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.
THE BEST NEWSPAPER published in the district is
THE TIDINGS.
Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.
Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.
DAILY, $8.00 a year; WEEKLY, $2.50, *in advance*.

Mechanical Progress.

New Railroad Signal.

A new automatic safety appliance now in use on an Eastern road is thus described: The transmitting power is compressed air at about 15 pounds pressure, and the mechanism in the hands of the towerman is a single lever, requiring a force of ten pounds to throw it. When this lever is upright, the distance semaphores at 1000 feet and the home ones at 500 are at danger in all four directions, and a double-jointed shoe is raised six inches in the center of the track opposite the home semaphore. If the engineer passes the home semiphore when at danger, this shoe strikes a lever hinged to the forward truck-frame of the locomotive, which in turn opens a cock in the air pipe, setting the brakes on the train. A hundred feet inside the home signal is a derailing point, which the locomotive would take if, by any failure of the air brakes, it reached that place. By throwing the lever in the tower to the right the air-brake shoe and semaphores fell and the derailing point closed on one line, but on the other remained as they were. The train on the open line advanced a few feet beyond the home signal, when the tread of the wheels pressed down a detector bar on the outside of the rail, which, through pneumatic pressure, locked the mechanism in the tower, so that while the signalman could bring his lever back to the upright position, thus setting the danger signals behind the train to prevent a rear-end collision, he could move it no farther, and it was absolutely impossible to open the other road to a train until after the one to which the crossing had been given had been cleared.

The air is conveyed in pipes, and there is a small cylinder, with plunger and piston, at each point where its force is to be exerted. The strong feature of this system is that when one road is closed the other is absolutely and effectually closed mechanically, and beyond the efforts of an excited or careless towerman to open it. The system is applicable to the approach of drawbridges and to the "blocking" of roads, in the latter case the train mechanically raising the danger signal behind it, which would be mechanically released only when the train had left the block; also to the working of switches. The interlocking feature appears to be positive.

Metal for Shot.

The metal for making shot has to be very carefully prepared. Tin is commonly found as an alloy of lead, but if there is so little as one pound of tin in six tons of lead the material will not produce shot; it will only yield oblong slugs. Pure lead will not make shot. It must have with it a proportion of arsenic. The latter has somewhat the same effect upon lead as lard or butter has on pastry; it makes it brittle, says the Washington *Star*.

To begin with, the metal is put into a pot with 30 pounds of arsenic to each ton of lead. The mixture is heated to a cherry red, which signifies about 2000 degrees Fahrenheit. The alloy thus prepared is made into pigs of 100 pounds each. One of these pigs is melted together with 1000 pounds of pure lead, and thus is obtained the material required for the shot. Not long ago a sensation was made in the newspapers by writers who asserted that game killed with shot that were loaded with arsenic must be poisonous. Of course nothing could be more absurd. The effect of this mineral on the metal is to cause the latter when melted to form itself naturally into globules, like quicksilver. When the man at the furnace wishes to ascertain whether his molten stuff is heated to the right temperature, he throws a little of it upon cool iron. If correct it splits into a lot of rolling globules resembling mercury. All being in readiness he skims off from the top of the melting pot a quantity of the impure stuff that floats on the surface. He puts a layer of this in the bottom of one of the saucepans. When partly cool it is of putty-like consistency. It is very porous.

Now the operator holds the saucepan over the central shaft, which is boxed in with planks all the way to the bottom of the tower. Looking down, one can see a faint shimmer of water in the well far below. The workman with his ladle pours some of the pure lead alloy into the pan. It makes its way through the porous stuff to the bottom of the utensil and forms a little drop at every opening in the perforated bottom.

The drops fall down the well, followed by others as fast as they can form. Being liquid drops, they are absolutely spherical when they leave the saucepan. The man keeps on adding melted lead with his ladle as fast as it is required, so that the shower of metal drops is continuous. By the time they have fallen 100 feet or more through the air they have cooled and hardened so far that the impact of the water does not alter their shape.

Gas versus Oil.

The superiority of gas lighting over the ordinary oil lamps in general use upon Indian railways was strikingly illustrated recently, says *Indian Engineering*, when a special train started from Howrah and ran to Seoraphuli and back in order to give the agent and some of the officials of the East Indian railway an opportunity of contrasting the two methods. The experimental train consisted of a first-class carriage and a guard's van, lighted with Pintsch's compressed oil gas. The illuminating power of the gas was, at a rough guess, tenfold that of the oil lamps, and the difference has only to be seen to be appreciated. In order to test the steadiness of the gas flame the fastest possible speed was ordered, and, despite the oscillation of the carriages, the gas lamps never flickered or wavered in the slightest degree. The pressure in the gas reservoirs, which at starting stands at six atmospheres, was hardly affected in this short run, the reduction not exceeding three pounds to the square inch. The smallest newspaper type could be read with ease in the gas-lighted carriages. In every respect the trip was highly successful.

A Great Railway Bridge.

German engineers are constructing a railway bridge which they hope to be able within the next two years to point to as one of the greatest triumphs of the age. It is located on the Solingen-Remscheld railway, where it crosses a deep valley which will be bridged over by an iron viaduct 1640 feet long and 351 feet high. A span 558 feet long, with a gigantic elliptical arch, forms the bridge proper, and at each side there are a number of strong pillars which are connected with one another by ironwork. All of the ironwork together will weigh 4100 tons. The end supports, each of which is arched to form a passage for a road, and the single supports, all of which are founded on solid rock, comprise 13,080 cubic yards of masonry. The work has been begun, but will not be completed for two years. The preparatory work is very extensive. It will be necessary to first build a temporary bridge 98 feet high. The material will be transported by means of a wire-rope road, and the separate parts will be raised by means of hoisting apparatus operated by electricity.

Mild Steel vs. Iron in Naval Construction.

Owners of steamers built of mild steel are beginning to find out that when subjected to heat and the action of acids it deteriorates much more rapidly than iron, observes the *Nautical Magazine*. In some cases the inner plating of the double bottom in the range of the engine-room has corroded through in a very short time. To meet this difficulty in a number of new vessels, in the part most likely to be affected, iron has been used. There are in addition to the inner plating of the double bottom, the frames and the reverse frames in the coal bunkers. In a large cargo steamer now building, the difficulty has been met by a large increase of the thickness of the inner-bottom plating. Not only has the reduction allowed for the use of steel instead of iron not been taken advantage of, but the plating has been made much thicker than it would be required if of iron.

Disposition of Steamship Ashes.

The method of raising ashes and cinders from the boiler-room of the great ocean steamships by means of a rope and tackle and baskets is rapidly being superseded by the novel system of Mr. See, an English engineer. The apparatus consists of a hopper placed in the fire-room, from which a discharge pipe extends upward below the main deck. The hopper into which the ashes are shovelled is placed a little above the boiler-room floor. At the bottom of the hopper is the ejector with its connection from the pump and its discharge leading upward and outward to the side of the vessel above the water-line.

The ashes, after being thrown into the hopper, encounter a jet of water from the pump and are forced up the discharge pipe quite clear of the vessel, from which the refuse will be discharged as fast as it can be shovelled into the hoppers. This discharge has been applied to the cruiser New York, the chief engineer reporting that "its construction is simple, and consists of few parts; occupies less space than other methods; a less number of men are required to work it; all dirt and noise are confined to the fire-room, and when at sea can be operated at any time, and without interfering with other parts of the ship."—Exchange.

Seamless Steel Pipes.

A Dusseldorf mechanic has invented a method of making steel tubes by punching the pipes from hot metal. This method gives, it is said, promises of success in the manufacture of seamless tubes of moderate lengths. The process consists in placing a bar of steel of square cross section in a matrix of a sufficient strength, having a hole of the exact diameter of the outside of the tube. Then, without giving time for the steel to cool, a mandrel, having a rounded end is forced lengthwise into the mass. It is said that tubes nearly eight inches in diameter have been made by this process, the pressure needed to operate the mandrel being 180 tons. The end of the heated bar furthest from the mandrel is first made to abut against a strong and heavy slide. When the rounded nose of the mandrel has nearly passed through the bar, this slide is moved transversely so as to bring a hole in line with the advancing mandrel, which, continuing to move, punches its way through. Its protruding end is then seized by tongues, and entirely withdrawn.

The operations as described, complete only the first stage of the process. The bar with its perforation is now finished by drawing and redrawing until the required thickness of the shell is reached.

A Remarkable Dam.

One of the most remarkable dams in the world for height and construction is that by which the Vyrnwy river, northern Wales, is enabled to supply water to the city of Liverpool, some 70 miles distant. In building this dam a great trench was first excavated across the valley for a length of 1100 feet, a width of 120 and a maximum depth of 60. The masonry was started in this trench; it consists of immense irregular blocks of slate, wedged together and thoroughly bedded in Portland cement mortar, the faces being formed of cut-stone blocks, fitted together with great care, the greatest height of the dam being 161 feet.

Its most remarkable feature is the lack of any channel to carry off floods, the surplus in the lake flowing down the front of the dam, which is curved to permit as free a descent as possible and prevent the formation of eddies at the bottom. The lake formed by this dam covers an area 4¾ miles long, from one-quarter to five-eigths of a mile wide and holds largely over 12,000,000 gallons. The aqueduct leading from the intake tower to the distributing reservoir, about two miles from the city, is 68 miles long, and consists principally of a large cast-iron pipe line from 39 to 42 inches in diameter. There are a number of reservoirs and tanks along the lines, and at one place is a great filtering plant.

Scientific Progress.

Characteristics of Meteorites.

Recently an account of a meteorite which fell near Beaver Creek, Washington, was printed. It was reported as bursting with several sharp reports in quick succession, the first explosion being the loudest. The noise was heard 25 miles away, and was mistaken for thunder or a blast of dynamite. Following the reports was a whizzing sound. Several fragments of the missile from the sky were picked up.

"It is a mistake to suppose that meteorites burst, in the proper sense of the word," said a scientist to a Washington reporter. "But it often happens that they are broken to pieces on striking the atmosphere of the earth. This may seem surprising, but let me call your attention to an analogy. Strike the surface of water with your fist, and, though a fluid, the resistance it opposes to the blow seems almost as strong as if it were a solid. Now, the meteorite is moving at a tremendous rate of speed. If small, it is set on fire in an instant by the friction of the air, and, after glowing for a moment brightly, is consumed.

"On any night in summer you will see 'shooting stars' now and then. They are meteorites, which, on coming into contact with the earth's atmosphere, are set afire. This is not surprising, inasmuch as they approach the planet on which we live at a speed which often attains 44 miles a second. By causing the destruction of meteorites the atmosphere serves as a protection for people on the globe, who would otherwise be pelted by such missiles to a dangerous extent. It is estimated that not less than 10,000,000 of them, big enough to be visible to the naked eye, strike the earth every 24 hours.

"It is believed by most astronomers that some very large meteors have entered our atmosphere and have passed out into space again, their great momentum being sufficient to take them away from the earth's attraction. What these flying bodies are is a question that has been much disputed, but it is considered most likely that they are the debris of broken-up comets. In one recent instance the correctness of this theory has found striking proof. That was the case of the comet Biela. It was discovered in 1826, and was again observed in 1832, 1845 and 1852. In 1845 it had split into two parts, and in 1872 it failed to appear when and where it should have done. Evidently it had been smashed up, and prediction was made that there would be a great meteoric shower composed of the remains of the lost comet. This prediction was fulfilled.

"Certain groups of meteors move in elliptical orbits around the sun. Occasionally the earth passes through their clusters, producing what are known as meteoric showers. Such showers occur annually from the 9th to the 12th of August, and there is a similar display in November once every thirty-three years. The stream of the August meteors

is estimated to he from 5,000,000 to 10,000,000 miles thick. The earth, though traveling with a velocity of 2,000,000 miles a day, is immersed in it for several days.

"The fall of meteorites to the earth is sometimes accompanied by a great display of light, occasionally illuminating an area of many thousand square miles, when such an event occurs at night, and hy loud detonations, so great in some instances as to shake houses and frighten men and animals. The explosions are caused by the breaking up of the meteor. Ordinarily you will find that such meteoric bodies are coated on the outside with a black substance, which is the effect merely of fusion of the superficial material by great heat. A piece of Biela's comet was actually picked up in Mexico in 1872, at the time of the shower of its remains. Naturally it is considered very interesting.

"Such great interest is taken in meteorites that all of those collected have been carefully catalogued. They are mostly composed of iron, with usually a percentage of nickel and cobalt, and sometimes copper and tin. It is customary to saw them into slices, which is a very laborious process, for sale or for exchange among museums. Sometimes the slices are prettily polished, or the cut surfaces are etched with acid so as to expose the crystalline structure. This structure is in no two such bodies exactly the same, and the differences are thought well worth studying. Attempts have been made to counterfeit meteorites, because they are so valuable, but without success."

Scientific Research Work in America.

I think it quite necessary to point out some of the difficulties encountered in successfully undertaking any scientific research work in America, says Albert Schneider in *Science*. In the first place we, as a nation, are too practical and short-sighted to make thorough scientists. We are too much engrossed with the present to undertake anything which promises only a probable reward in the distant future. In the second place, we lack sufficient scientific training. Boast as we will, we must admit that Germany, France, England, and even Russia, are a long way in the lead in scholarship. From this lack of training we must content ourselves with going over the ground already gone over hy European scholars. Nor is this because of our "infantile" condition. There is no plausible reason why the American mind should not he as ready of comprehension and understanding as any other. We have incipient philosophers who might become equal to or superior to any in the world. The great trouble is that they imagine themselves superior while they are yet in the embryo stage, and as a natural result become fossilized embryos. This is not always the case, hut it is true in the majority of cases. Another great drawback is the uncertainty of holding a position when once taken. This deadens interest and absolutely prevents the possibility of undertaking any work which must of necessity be long continued. In Germany the professor is almost certain of holding his position a lifetime if he so desires. As far as his position is concerned he is almost an absolute monarch. The nature of his work is never inquired into hy the laity. He is given a position because it is known from his preparation and training that he is fully competent. This enables him to begin a work which may require generations for its completion. Lastly the management and directorship of scientific laboratories and experiment stations is too often placed in the hands of men wholly incompetent, considered from a scholarly standpoint. They cannot comprehend the nature of scientific research work nor understand the benefits that might be realized therefrom.

These, in brief, are some of the main difficulties which beset our scientific research work. It is not my purpose to belittle intentionally the work we do or have done. Nor do I believe the prospects for the future to he gloomy and hopeless. America is destined (in time) to lead the world in science and all other branches of learning.

New Uses for the Microscope.

The future of the microscope is as promising as that of any optical instrument, says the *Optician*. New uses are found for it constantly, and in the not very distant future we may find it an article of necessity in every household. When we reflect, it is surprising what a multiplicity of disease might be avoided were the microscope to be installed in our homes and microscopy made an essential branch of our education. The Germans are far in advance of us in this direction. In Berlin, and, we believe, in other important centers of Germany, all animals intended for human consumption. must he killed at the municipal slaughterhouse. There is a heavy penalty for any breach of this law. Not only is every animal subjected to a careful scientific investigation, hut specimens of its blood and tissues are examined under powerful microscopes. In Berlin 45 lady microscopists, who have been thoroughly trained for the work, are constantly employed in these examinations. We strongly recommend this system to the authorities, and we would advise opticians to point out to their customers, verhally or hy pamphlet, the great assistance that even a superficial knowledge of microscopy may be in the avoidance of the ills that flesh is heir to, either inherently or by contagion or infection.

Disease Through the Skin.

Can the bacilli of infections diseases find entrance through the skin? asks an English doctor, who adds: "I do not see that this is at all impossible, as the skin is to a considerable extent absorbent. That we catch diseases most frequently through the delicate mucous membrane of the lungs goes without saying, hut that is no reason why perfect and daily ablution of the skin should not be the motto of every one who wants to keep well and free from danger. The matutinal tub, therefore, should he an institution in every family, quite as much as is the toothbrush. Cleanliness is next to godliness, and if King Cholera came to these shores, I think he would very likely pass over those who were sprinkled. By the way, I noticed the other day that a well-known London journal was calling attention to a new and simple plan of disinfecting rooms. Why, it is quite an old plan. Put a saucerful of salt in the middle of a room and pour on it a dram or two of sulphuric acid. The fumes that arise do the work of disinfection.

Enormous Heat of the Sun.

It has been calculated that the heat given off by the sun in a second of time would melt a pillar of ice 1590 square miles at its base and 194,626 miles in height. If this heat is produced hy fuel added from outside of the sun, there must he added every second of time a quantity of fuel capable of melting this enormous quantity of ice, and this would require a quantity of coal of almost equal mass. If iron, copper or stones were added, we cannot conceive how this would generate heat, for, if added to terrestrial fires, they absorb heat instead of producing it. Meteors are of this nature, containing a large percentage of iron, and being composed of what we would term non-combustible materials.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Practical Hydraulics.
A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.
BY P. M. RANDALL.
This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.
Table of Contents.
The following brief abstract of the contents will give an idea of the branches of the subject treated:
General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.
Price, $2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco, Cal.

PRACTICAL TREATISE ON HYDRAULIC MINING.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Electricity.

The Antiquity of the Telephone.

It is a pretty widely known fact that as early as 1667 the English physicist, Robert Hooke, described the transmission of sound to a very considerable distance. He says that by the help of a tightly drawn wire, which even might be bent in many angles, sound might be propagated to a long distance and with a rapidity which, though inferior to that of light, was, at any rate, infinitely superior to that of sound in the open air.

It is a most curious fact, and one which is not so generally known, that Jacob Cristoph von Grimmelshausen, a German author of the seventeenth century, in the first chapter of the third book of his celebrated novel, "Simplicius Simplicissimus," mentions an instrument which, according to his description, not only corresponds to Robert Hooke's apparatus, but leads to the assumption of the existence of a contrivance at the time of the Thirty Years' War, very similar to our present telephone, says *Electricity*. The passage from the book reads literally as follows: "I was, as already mentioned, so eager to gain honor and renown, that I could not sleep while all this was passing through my head. And when I had such fancies, and lay awake many a night thinking how I might contrive new finds and stratagems, I had very curious notions; consequently, I bethought myself of an instrument with which I could on a calm night hear a trumpet being blown at three hours' distance, and a horse neighing and a dog barking at two hours, and a man talking at one hour's distance. In the daytime the instrument was not so useful to me, unless it were in a quiet place, because one would have heard the horses and the cattle, down to the least bird in the air, or frog in the water, all together, so that one would not have understood one in consequence of the noise of the other. Now, I know quite well that there are people at this very hour who do not believe me, but whether they believe me or not, it is the truth. I undertake, by means of an instrument invented by me, to recognize at night by his voice a man who does not speak louder than is his usual custom. And no one would believe me of those who saw with their own eyes how I used the aforesaid instrument, and when I said to them, 'I hear horsemen galloping, for the horses are shod,' or 'I hear peasants, for the horses go barefooted;' then 'there goes a herd of cattle, for I hear sheep bleating, bulls bellowing and pigs grunting, and so forth.' My own comrades at first took these speeches for 'fibs,' but when they found in reality that I was always speaking the truth, then they called it witchcraft taught me secretly by the devil's own mother. I am of opinion that if I had taught this science openly I should have become very popular, because it would have proved of great advantage to those engaged in war, especially in sieges." This is what Grimmelshausen says about his "far-hearing instrument," to which must be accredited a certain resemblance with the present telephone.

Electric Signals Without Wires.

A very interesting experiment has been made by Mr. W. H. Preece on the transmission of electric signals through space without wires. A heavy copper conductor was suspended on poles for a distance of 1267 yards along the shore of the Bristol channel, says the *Engineering Magazine*. On an island 3.1 miles distant a gutta-percha-covered wire 600 yards in length was laid. Through the shore circuit an alternating current of 150 volts and a maximum strength of 16 amperes was transmitted, which could be broken up into signals in the usual way by means of a Morse key. Telephones in the secondary line were used for receiving instruments. No difficulty was experienced in reading the signals at this distance, but, when tried with a wire laid on another island at a distance of 5.35 miles, though signals could be perceived, intelligible communication was found to be impossible. Mr. Preece finds it essential, to insure good results, that the secondary wire should be of a length at least equal to the distance between it and the primary wire. The system, therefore, fails to provide for the cases of isolated lighthouses and lightships, where such a means of communication, if practicable, might often prove of the greatest value. Experiments are now in progress to determine whether this principle is available for indicating the approach of a vessel to lighthouses and landfalls, but no results have as yet been made public.

Freak of Electricity.

The peculiar action of the electric current is sometimes very interesting, as well as amusing. A Portland, Or., paper tells that Mrs. M. E. Thompson, who resides on Williams avenue, Upper Albina, went into her yard the other day to gather some plums. The first one she touched gave her an electric shock. Again she tried to gather the plums, and every time she touched one she received a strong shock.

Unable to account for the occurrence, she called in a neighbor, and she went through the same experience, and not a plum could they get. Mr. Menefee was called, and he started toward the place where the ladies were standing, and came in contact with a clothesline full of clothes. In attempting to separate the clothes, so he could pass, his hands came in contact with the line, and he received a shock that knocked him down. This led to investigation, made with great caution, and it was discovered that the electric-light wire connected with the house was broken and had fallen across the clothesline, one end of which was attached to the plum tree. The line and clothes were damp and formed a good conductor. Also, when a plum was touched, a circuit was completed and a shock received.

Electrical Magic.

In his autobiography the late Sir W. Siemens relates an amusing anecdote. An Arab called his attention to the fact that when at the top of the Pyramid of Cheops when he raised his hand with fingers outspread, an acute singing note was heard, the sound ceasing as soon as he let his hand fall. "I found his assertion," he writes, "to be true. As soon as I raised one of my own fingers above my head I felt a prickling in my fingers. That this could only be caused by an electrical phenomenon was proved by the slight electric shock felt on trying to drink out of a wine bottle. So I wrapped a full bottle of wine that I had with me in damp paper, and thus converted it into a Leyden bottle, which was soon strongly charged with electricity by the simple device of holding it high above my head. The Arabs had already become distrustful on seeing small lightnings, as it were, issue from the wine bottles held up by myself and companions, and now held a brief consultation.

"Suddenly, at a given signal, each of my companions were seized by the guide who led him up, who now tried to force him to go down again. I myself was standing at the very top of the pyramid when the sheikh of the Arabs came to me and told me, through my interpreter, that the Arabs had determined that we were at once to leave the pyramid, because we were practicing magic, and it might damage their chance of earning a living. On my refusing to obey orders, the sheikh caught hold of my left hand.

"I had awaited this moment, and held my right hand with the bottle in the attitude of a magician, afterward lowering it slowly toward the point of the sheikh's nose. When quite close to the feature I felt a violent shock run through the bottle to my own arm, and was certain that the sheikh must have received the equivalent. At any rate he fell speechless on the stones, and a few anxious moments passed before he rose suddenly with a loud cry, and sprang down the gigantic steps of the pyramid with long strides. The Arabs, seeing this, and excited by the sheikh's constant cries of 'Magic! magic!' released my companions, and followed their leader, leaving us complete masters of the pyramid."

Illuminating Powers of Paraffins and Olefines.

It is a remarkable fact, and one of some importance in gas-making, that the gases of the paraffin series are of much lower illuminating power than those of the olefine series, says an exchange. For example, ethane, the second member of the paraffin or saturated series, has an illuminating value of some 34 or 35 candles, while ethylene, the corresponding member of the unsaturated group, has an illuminating power of some 68 or 70 candle power. As the Russian oils are composed chiefly of the olefines, the unsaturated hydro-carbons, it is probable that this oil would be better fitted for use in enriching water gas for illumination than the American crude, which is composed almost exclusively of paraffins. It is stated by Dr. Vivian Lewis, however, that ethane can be readily converted into ethylene by heating it. This explains why more light can at times be got out of an oil by converting it into gas. The illuminating power of the paraffin is increased by its conversion into an olefine. Dr. Lewis also states that the cracking of the paraffins results in the formation of nearly equal quantities of saturated and unsaturated hydro-carbons, that is of paraffins and olefines.

How to Show Lines of Electric Force.

The following experiment for making visible lines of electric force is described by Herr Brnno Kolbe: Into a flat cylindrical vessel pour purified anhydrous oil of turpentine to a depth of about two cm., and add some sulphate of quinine. To the rim of the vessel attach two wire springs, adjusted so that the two small metallic balls at their side dip into the turpentine. Stir the quinine with a glass rod so as to distribute it evenly, place the vessel on a black cardboard. Join the two wires to the terminals of an influence machine, and turn very slowly. At once the white crystals group themselves so as to form beautiful curves, respresenting the "lines of electric force." The form of these curves recalls that of the brush discharge of the influence machine. Prof. Weiler, of Esslingen, gives the following experiment: Prepare a milky mixture by stirring up finely-divided quinine in oil of turpentine. On sending a series of discharges through it, a clearance is produced at the positive pole, and the particles cluster round the negative pole, arranging themselves in streamers directed along the lines of force.

To Control Wind Currents.

An interesting note in a London paper on wind-power says that some years ago an attempt was made, under the auspices of the Duc de Feltre and M. L. Vigreux, to drive the dynamos at the Pointe de la Heve lighthouse by wind-power. The wind, however, as is its custom, blew when and where it listed, and ended one fine, or, rather, one stormy day, by overthrowing the ungainly apparatus installed on the exposed headland. M. Max de Nansouty, in alluding to this attempt to harness the wind, suggests that, next time a similar attempts is made, it would be as well to try the effect of surrounding the "atmospheric turbines" by strong towers, and directing the wind onto the vanes by nozzles in much the same way as the water is directed onto the buckets of a Pelton wheel. This idea of "canalizing" air currents is, it is said, actually engaging the attention of windmill experts.

Fires from Electricity.

Returns for one year from the fire departments of 60 principal cities in the United States, selected from among those having more than 20,000 inhabitants, show that the fires attributed to electricity constitute 1.19 per cent of the aggregate number, and 1.23 per cent of the aggregate losses, says the *Engineering Magazine*. New York City heads the list with 59 fires, followed by Boston with 26. The generator capacity of the electric light and power plants now running in these cities, including central stations, isolated plants and street railways, amounts to more than 200,000,000 watts, which is equivalent to nearly 4,000,000 16-candle power incandescent lamps, or 285,000-horse power.

The Difference.

An Eastern judge in rendering a decision in the first Julien storage-battery case, made a very apt distinction between the primary battery and the storage battery, and one quite comprehensible to the layman. "The two differ," said he, "as a spring differs from a reservoir."

Useful Information.

Modern Explosives.

The composition of some of the modern high explosives, according to *Engineering*, is as follows:

Dynamite — Seventy-five parts of nitro-glycerine and 25 of infusorial earth.

Dualine—Eighty parts nitro-glycerine and 20 of nitro-cellulose or gun cotton.

Rendrock—Forty parts nitro-glycerine, 40 of nitrate of potash or soda, 13 of cellulose and 7 of paraffine.

Giant powder—Thirty-six parts of nitro-glycerine, 48 of nitrate of potash or soda, 8 of sulphur and 8 of resin or charcoal.

Mica powder—Fifty-two parts of nitro-glycerine and 48 of pulverized mica.

Tonite—Fifty-two and one-half parts of gun cotton and 47½ of nitrate of baryta.

Blasting gelatin — Ninety-two parts of nitro-glycerine and 8 of gun cotton.

Atlas powder—Seventy-five parts of nitro-glycerine, 21 of wood fibre, 2 of carbonate of magnesia and 2 of nitrate of soda.

Rackarock — Seventy-seven and seven-tenths parts of chlorate of potash and 23.3 of nitro-benzol.

It will be noticed that nearly all the above explosives are composed principally of nitro-glycerine; and it is probable that in most cases the other ingredients only act as absorbents for this liquid, and really add nothing to the explosive power. The decomposition of nitro-glycerine is practically instantaneous, and the slower-acting nitrates and hydrocarbons must be left far behind when the mass is exploded. The power of all these substances is due to the paradoxical element nitrogen, which is by itself the most neutral and inactive of all the elements, but, when forced into chemical combination, usually confers an element of weakness upon the entire molecule of which it forms a part.

Greatest Cost of Lead Pencils.

"The greatest cost in making first-class lead pencils is not in the wood, even when the smoothest and straightest grained Florida cedar is used, nor in the finishing and stamping of the pencils, though the finest varnish and purest gold are used," says the Joseph Dixon Crucible Company of Jersey City. "The greatest cost is in the time and labor spent in manipulating the materials of which the lead is made. The materials used in making such leads are the finest and smoothest graphite and clay. The graphite

is specially selected for the purpose, and is most carefully floated through water time and again, which allows the grit and coarser particles to sink and become separated. The clay is also subjected to similar thorough and careful treatment. The proportion of clay determines the degree of hardness; and therefore, in order that the leads may be uniform in hardness as well as toughness, long-continued grinding and mixing are necessary, as well as other painstaking operations, before the leads are perfected and ready for the wood and the finishing processes. In cheap pencils, no matter what the finish may be, the leads receive but scant attention."

The Family, Pro and Con.

Family reunions seem to be growing very popular. They have been chronicled by the score in the newspapers this summer, and the increasing frequency of them may, perhaps, be taken as a sign of a growing interest among Americans in family stocks. In Virginia, and more or less generally throughout the South, people have been in the habit of acknowledging their cousins, and keeping some sort of track of them; but it used to be asserted down there that, in the North, blood was not much thicker than water, and that relationship was but a slender tie, to be recognized or ignored as expediency might direct. The North must be improving in that respect, and perhaps it is well that it is. The tendency of American institutions and of the conditions of life in this country for the last century has been to develop individualism to an extreme degree. Families have been systematically scattered. Some members have gone West, others have moved to town, and all have worked out their independent destinies as best they could.]

That is a good way; but there are advantages, too, of people of the same blood touching elbows and keeping one another in sight. A large family connection has its drawbacks, but it has compensations, too. It involves a degree of mutual assistance that may sometimes be inconvenient to the more prosperous members; but it also involves co-operation which may be helpful to all the parties to it, and, by creating new interests in people, it helps to quicken one's interest in life. Life is no fun unless one takes an interest in somebody, and to be interested, not exclusively, but genially, in one's relations is a good plan, and is really no more trouble and costs no more than to be interested in people who are other people's relations. Family reunions, provided they are skillfully engineered and do not happen too often, may be pretty good sport, and people who keep out of them for fear of meeting poor relations whom they do not know are in reasonable danger of losing more than they escape.—Harper's Weekly.

Raw Silk from Abroad.

The value of the raw silk imported into the country annually is given as $25,000,000. This is used in the manufacture of ribbons, fabrics, etc., in four States, one of which is Pennsylvania, which perhaps uses two-fifths of the whole—or to the value of $10,000,000. The value of the silk manufactures of Pennsylvania, as given by Hon. Lorin Blodgett, than whom there is no better authority, is $79,000,000. As 65 to 70 per cent of the cost of manufacture in this industry consists in the wages paid to labor, here we have an illustration of the number of families that are made comfortable by remunerative employment by an industry, the raw material for which comes from the other side of the world.

For What Is Lumber Used?

For what is the greatest amount of lumber used? Nine people out of ten will say for houses and buildings. It is doubtful if 35 per cent of the lumber output goes into buildings. The railroads, farmers and miscellaneous purposes take about 40 per cent, and the other 20 per cent goes into boxes.

Don't Hear Everything.

That was a wise remark by a lady who had brought up a large family: "You have got to overlook some things in a little child. You cannot expect them to be perfect." In the same line are these remarks from a religious paper:

"The art of not hearing should be learned by all. There are so many things which it is painful to hear, very many of which, if heard, will disturb the temper, corrupt simplicity and modesty, detract from contentment and happiness. If a man falls into a violent passion, and calls us all manner of names, at the first sound we should shut our ears and hear no more. If in a quiet voyage of life we find ourselves caught in one of those domestic whirlwinds of scolding, we should shut our ears as a sailor would furl his sail, and, making all tight, scud before the gale. If a hot, restless man begins to inflame our feelings, we should consider what mischief the fiery sparks may do in our magazine below, where our temper is kept, and instantly close the door. If all the petty things said of one by heedless or ill-natured idlers were brought home to him, he would become a mere walking pincushion stuck full of sharp remarks. If we would be happy when among good men, we should open our ears; when among bad men, shut them. It is not worth while to hear what our neighbors say about our children, what our rivals say about our business, our dress or our affairs."—Observer.

Language of the Visiting Card.

The custom of turning down the corners of the cards to signify different messages is not a very general one, as it is considered better form to have one's pasteboard representative as fresh in appearance as possible, writes Mrs. Hamilton Mott in the October *Ladies' Home Journal*. However, the fashion does obtain to a small extent, and its language is as follows: Turning the upper right-hand corner signifies that the single card is to include all the ladies of the household, and turning the upper left-hand corner, that the call was made personally. This latter is the more senseless custom, as except in Washington, where the visiting duties are so very onerous, it is very unusual in this country for ladies to call by proxy or to send their cards to a door by their maid or footman.

Killed by Ice Water.

Cases of death by drinking ice water when one is overheated have been reported. Great care should be taken in regard to this matter. The craving for cold water when the heat is great and a person has been exerting himself is sometimes almost irresistible. But the craving should be but sparingly indulged. In fact, it would be better at such times not to drink very cold water at all. Water of only moderate coolness would be a great deal better. One should exercise the restraints of common prudence in such matters. "Killed by ice water" is a verdict which no coroner's jury should have it in their power to render.—N. Y. Ledger.

Delicious Mixed Pickles.

Let five dozen small cucumbers stand in strong brine for three days, writes Eliza R. Parker in the *Ladies' Home Journal*. Wash through cold water several times. Put half a gallon of strong vinegar in a kettle, with one ounce of mustard seed, one of juniper berries, one of celery seed, half a dozen pods of green peppers, two pounds of sugar, half dozen small onions and a lump of alum. Let come to a boil, and pour over the pickles for three mornings, heating the vinegar each time. Put the pickles in wide-mouthed bottles and seal.

ABC OF ELECTRICITY

By WILLIAM H. MEADOWCROFT

Endorsed by THOS. A. EDISON.

WHAT THE PRESS SAYS.

"A clear and comprehensive little treatise."—*N. Y. Sun.*

"Electric Science is making magnificent strides and this book fills a useful office in setting forth the features and characters of these advances."—*Brooklyn Times.*

"The need of such a book has undoubtedly been felt by many . . . we predict for it a splendid sale."—*The Age of Steel.*

"A book like this should be largely read."—*N. Y. Herald.*

"The book is well illustrated, and no pains have been spared to make it accurate and reliable throughout."—*Electrical Review.*

"In simple language, the author lays bare the secrets of electrical science and application."—*Electrical World.*

"A vast amount of useful importance."—*Washington Post.*

FROM THE LABORATORY OF THOS. A. EDISON,
ORANGE, N. J., Sept., 24, 1888.

DEAR SIR—I have read the MS. of your "A B C of Electricity," and find that the statements you have made therein are correct. Your treatment of the subject, and arrangement of the matter, have impressed me favorably.

Yours truly,
THOS. A. EDISON.

PRICE 50 CENTS, POST PAID.

— FOR SALE BY —

MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco, Cal.

Adamantine Shoes and Dies

— AND —

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill supplies.

Stamp Cam.

Metallurgy and Ores.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

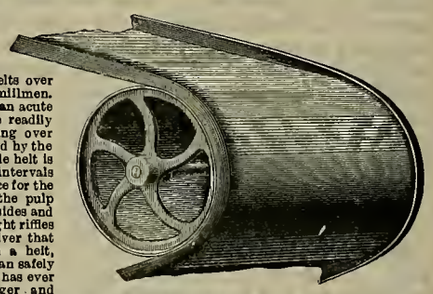
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
NO. 130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

An Important Decision.

A very important case having direct effect upon mineral lands in odd-nnmhered sections within the railroad grants of this State has been decided hy the United States Court of Appeals in a case from Montana. It is well known that the railroad companies of this State claim title to all mineral lands in odd-numhered sections of Government grants, the mineral character of which was not established at the time of the grant. The railroad company is upheld in this position hy the decision of United States Judge Sawyer, who ruled that the clause in the land grant excepting mlneral lands did not obtain in cases where the mineral was discovered subsequent to the grant. In obtaining title to mineral lands on railroad grants in this State, it has always heen necessary for an applicant for patent to ohtain the railroad company's quit-claim deed, as well as to secure a patent from the United States. In instances the officers of the United States Land Office have refused to proceed witb a mineral application where it covered a parcel of an odd-numbered section within the limits of a railroad grant witbout the issuance of a direct and special summons to the railroad company, or the production of an ahandonment from the railroad company.

The rule has been settled heyond any peradventure hy the decision of the United States Circuit Court of Appeals, in the case of the N. P. R. R. Co. vs. Cannon et al., 54 Fed. Rep., 252, reported to us hy Edward A. Belcher, attorney-at-law of this city.

In that case the railroad company filed a bill in the United States Clrcuit Court for Montana to quiet titie for a parcel of an odd-numbered section of its land grant. The grant to the Northern Pacific Railroad Company, as is the case with all of the land grants to railroad companies on the Pacific coast, excepted "mineral lands." The hill alleged that hy the Federal survey the land in question had been returned as agricultural in character; that the company filed its map of general route February 21, 1872, and its map of definite location July 6, 1882; that on August 28, 1878, the defendants, pretending that the land was valuahle for the precious metals contained within it, made application to the United States Land Office to purchase the land as "mineral land;" that the officers of the Land Department gave the customary notice of said application by pnhlication and posting, and none other; that afterwards such testimony was taken and such proceedings had touching such application and the alleged character of said land as "mineral land" that the officers of the Land Office permitted the defendants to enter and pay for said land as "mineral land," and that afterwards a patent for said land as "mineral land" was issued to the defendants hy the United States; that the company had no actual notice of the patent proceedings, and did not know of such application until long afterwards, and had no opportnnity to make a contest or show the cbaracter of the land.

A demurrer was interposed and entertained, and on appeal the United States Circuit Court of Appeals said:

Appellant [the railroad company] claims that no notice was given personally to it. *The law does not require any such notice to be given.* The notice required by Sectiou 2325 is a general notice to all persons who might from any cause claim any interest in the land. Under Section 2325, Rev. Stat. U. S., provision is made in case of a contest as to the land, whether agricultural or mineral, and if appellant had desired to contest that question it had the opportunity to do so, and, *after initiating a contest, it would have been entitled to personal notice of all the proceedings thereafter taken, and to have participated therein, and offered such proofs as it might have been able to procure as to the character of the land.* Not having initiated any such contest, it is not in a position to complain that it was not personally served with notice of the proceedings. * * * Appellant's claim was *for agricultural land included in the grant.* The defendant's application was *for mineral land excluded from the grant and open to exploration, location and purchase independent of the grant.* When appellant accepted the grant, and at all times thereafter, it knew that the mineral lands were excluded from its grant, and the law charged it witb notice that mining locations and applications for patents might he made and patents obtained therefor hy persons claiming the lands to he mineral. The Government of tbe United States performed its duty to appellant when it provided a mode and a tribunal for determining the character of the land. Under the provisions of the statute we have quoted and referred to *appellant* [the railroad company] *was charged with knowledge of the notice which the mineral applicant was required to give by general application and by the posting of notices upon the claim, and of the notices required to be given by the Land Department,* and having failed to file any contest against the defendants' application, the question thereafter, as to the character of the land, whether mineral or not, became a matter hetween the defendants and the Government of the United States.

So far as known, tbis decision bas not altered the practice of land offices in this State. It is atill necessary to issue a special summons to a railroad company or procure the company's abandonment. The railroad companies are not entitled to any other notice of the application for a mineral patent than the published and posted notice. Further, it would seem to he settled that the company's title to the land is of no value, and need not be purchased.

Reduction Works at Reno.

The new reduction works nnder course of construction at Reno, Nev., are rapidly approacbing completion, and will soon be ready for business. The location is one mile helow Reno, on the Truckee river. The appliances at the works include a dry-crushing ten-stamp battery, amalgamating pans and chlorinating furnace. In addition, a copper-matte smelting furnace is heing constructed. A building 45 by 100 feet is belng erected for this furnace. The stack is 60 feet bigb. The furnace is a water-jacket with a capacity of from 50 to 60 tons a day. Gold, silver, copper and lead ores or ores containing sufficient of any or all of these metals will he snccessfully treated. There are on band now sulphnrets from Esmeralda, gold ores from Kennedy, and silver ores from Oreana in Hnmboldt county, antimonial silver from the Cottonwood mines in northern Washoe, free-milling silver ores from the Corliss mine in Peavine, ten miles from Reno, and, in short, ores in greater or less qnantities from nearly every district in northern Nevada.

H. H. Beck is general manager of tbe works and R. D. Clark superintendent and metallurgist. Mr. Clark is a practical smelter and millman who has had many years experience and thoronghly understands the husiness. The company pay cash for all kinds of ores that contain sufficient gold, silver, copper or lead to pay for handling them. The Central Pacific Railroad transports ores from all stations on the line at the rate of one cent per ton per mile.

To Revive the Comstock.

James G. Rule, a veteran miner, who was superintendent of the Consolidated California and Virginia Mining Company in 1884–5, when John P. Jones had a lease of the npper levels of that mine, has made a proposition to the managers of the company that has attracted mnch interest. Mr. Rnle says he knows of the existence of a large body of good ore ahove the 1100 level of the old Consolidated Virginia ground. He believes tbat this body of ore, if developed, will add many millions to the bullion outpnt of the property and enable it to be again put on a paying basis. He claims to have discovered the existence of this body of ore while directing tbe work done by Senator Jones. He asks for six months and a considerable expenditure of the company's funds for the prosecntion of the work, and asks for no compensation if the ore be not uncovered within three months.

The managers of the company are inclined to look favorably upon the proposition, as they see in it a possible chance of reviving the property. Mr. Rnle has made similar propositions in the past, and those in charge thonght it advisable to continue the work of prospecting according to the plans of those in charge. As this last has developed nothing of any value, and as the company has a certain amonnt of money that may be utilized in making further prospects, it is felt that Mr. Rule's plan should he adopted.

The meeting of the stockholders of the Consolidated California and Virginia mine will be held on Monday, Oct. 16th, when action will be taken regarding tbe proposition made by Mr. Rule.

Coast Industrial Notes.

—The well-known ranching firm of Smith & Ballaine at Tekoa, Wash., assigned, with assets of $20,000 and liahilities of $30,000, to T. J. Person of Endlcott.

—The employes in the shops at Wadsworth, Nev., have heen put on full time again. For some time past they, as well as the shop employes on the entire system, had been working only 32 hours a week to prevent a reduction in dividends of the railroad company.

—It is now proposed to re-establish rates of dockage and wharfage at the Oakland city wharf, so that all passenger and freight ferries between Oakland and San Francisco can he given special rates, to be fixed by the Council, which shall not be less than 30 per cent of regular rates.

—A deed of trust from the Southern Pacific Railroad to the Central Trust Company for the sum of $58,000,000 has been filed in the local County Recorder's office. This deed of trust is merely intended as security for the new issue of bonds recently authorized hy the Southern Pacific directors.

—The Board of Supervisors has authorized the San Bernardino county clerk to advertise for sealed proposals for buildlng an addition to the courthouse, according to plans and specifications drawn up by Architect Jones. This is really but a part of the new courthouse now being built, and covers the roofing and inside finishings.

—The creditors of the Navarro Mill Company heid a meeting last Saturday evening. The Anglo-California Bank has an indebtedness of $150,000, T. J. Clunie $115,000, and a second mortgage of $100,000, and unsecured claims aggregating $130,000, making a total indebtedness of $490,000. The creditors decided to resume work.

—The sale of the Pacific Railway Company's property at Los Angeles under a decree of foreclosure took place last week, and as was expected, the Consolidated Electric Railway Company was the only hidder. To the last-named company was knocked down the properties advertised for sale, including all of the franchises and appurtenances of the cable road, for the consideration of $1,344,320.48.

—A movement has been successfully started at Tacoma to hold a general Northwest Coast Fair during the months of August, September and October of next year. All the coast States and Idaho, Nevada, Montana, Alaska and Britlsh Columbia will be invited to participate. The buildings of the Western Washington Exposition are to be enlarged for the purpose. The stock show will he made a special feature. Subscriptions to the fund have already been made, and much enthusiasm is shown.

—The Bodie Railway and Lumher Company, to build a 30-mile road in Mono county and engage in the lumbering business, has been incorporated with a capital stock of $200,000, of which $34,000 has been subscribed. William John Menzies, a capitalist of Edinburgh, Scotland, is at the head of the company, with $33,500 of the stock. Associated with him, each holding $100 in stock, are Thomas Menzies of San Rafael, Charles P. Eells, William S. Wood, E. L. Reese and R. H. Floyd of San Francisco.

—Judge Hanford of the United States Circuit Court for the State ot Washington has granted the application of the Farmers' Loan and Trust Company and Henry H. Trowhridge for receivers for four branch lines of the Northern Pacific in that State. They are: Cascade Railroad, Green River Railroad, United Railroads of Washington and Central Washington railroads. Henry Stanton of New York City, F. B. Howell of Spokane and C. H. Prescott of Tacoma were appointed receivers, under $75,000 bonds each.

—The Anglo-Nevada Assurance corporation has filed a petitlon in the local Snperior Court for dlssolntion. The company was incorporated in 1885 wlth $2,000,000 capltal stock. In 1891 the stock was reduced to $500,000, and last year to $200,000. The London and Lancashire and Caledonia Companies have relnsured the policy-holders. The directors of the corporation are J. F. Bigelow, Louis Sloss, Wm. Macdonald, J. L. Flood, W. H. Dimond, E. E. Eyre, W. F. Whittier, E. L. Griffith, Chas. S. Neal, D. F. Tililnghast and M. H. Hecht.

—Col. H. B. Maxson, with a corps of surveyors, is running township lines out of Lovelock, Nev., to determine if the iron deposits in Buena Vista valley come wlthin the 20-mile grant to the C. P. R. R. If so, the railroad will claim possesslon, and, it is surmised, will hulld a branch line from Lovelock to the ore bodies, there to manufacture their own pig iron to be converted into raiis, etc. A company was organized this summer in New York City to purchase and work the iron hills, but the financial panic came on, upsetting the enterprise.

—The annual meeting of stockholders of the Bank of California was held Tuesday, 20,300 shares being represented. At the election the only change made in the Board of Directors was the substitution of George Whittell in place of Jerome Lincoln. The finances of the institution were reported to be in an excellent condition, total assets reaching $12,783,130.27. During the year dividends amounted to $450,000. William Alvord was elected president; Thomas Brown, cashier; S. Prentiss Smith, first assistant cashier; Irving F. Moulton, second assistant cashier, and Edward S. Hast, secretary.

—An address has been issned by the Executive Committee of the San Francisco Traffic Association reviewing the work of that organization. The saving to the merchants and consumers of this State through the competition introduced by the association is estimated at $500,000 a month. The following instances of saving in freight are cited: Last season dried fruit and raisins in boxes were charged at the rate of $1.40 per hundred pounds; now $1 by rail and 50 cents by steamer, saving from 40 to 90 cents per 100 pounds; canned goods from $1 per 100 pounds last season to 50 cents by rail and 30 cents hy sea at this time; wine reduced from 12½ cents per gallon hy rail and 7½ cents by sea to 3 cents per gallon by all lines; borax from $1 hy rail to 35 cents hy rail or sea; wool ln grease from $1.50 per 100 ponnds and scoured $2.50 per 100 pounds hy rall to 75 cents per 100 pounds hy all llnes; beans from $1.10 per 100 pounds by rail to 50 cents hy rail and 30 cents hy steamer; harley from 90 cents by rail to 30 cents by rail and 25 cents by steamer. Other seeds and California products, including leather, have been slmilarly affected.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

STRUCK THE LEDGE.—*Ledger*, Oct. 6: The Hardenbnrg people who bave been crosscntting from the 800-foot level to strike the ledgs, have at last reacbed it and are more than pleased with its appesrancs.

C. J. Moore, of the Blazing Star mine, near West Point, in company with Richard McGee of the same mins, bss besn doing some prospecting on the mother lode west of tbe Moore mine.

Mr. Clarkson, who was here in company with Issac Trnmbo a short time ago looking at the Bellweather, accepted S. W. Bright'e proposition to sell the property, the sale to be conenmmated in 30 days. Mr. Clarkson on retnrning home fonnd capital so scarce that he was compelled to ask for an extension of the time originally aeked, which was granted by Mr. Bright.

The Irma people on a test experiment sent five tons of ore to the Selby Smelting Works. The ore was carefnlly selected and being the heaviest in mineral they had in the ore bin. Their retnrns from the rock was $160 per ton gross, and that whicb was left in the ore bin after the selection went $30 per ton in the Gracey mill on the premises. Tbe net returne from the rock sent to Selby'e was $130. This test was made to assist the compsny in deciding whetber it wonld be a profitable investment to pnt in the 10-stamp mill which tbey bave been for some time intending to pnrchase.

The Veta Madre Mining Co. wss recently formed in San Francisco for the pnrpose of developing the Bright and the Shober mines. The property is locsted sonth of Jackson creek npon that division of the mother lode on which is found the Kennedy, Argonant and Alma mines and which has been worked by prospectors in former years, who mined and milled ores to the water level 50 to 70 feet in depth. The Shober covers about 900 feet along the line of lode and the croppings of a valnable ore body have been worked about 200 feet in length and at one point more than 20 feet in width. A well-known firm in Jackson who operated this property sbow returns of $3.50 to $4 per ton free gold from milling of ore taken from a large pit in the ontcrop. The Bright mine adjoins the Shober on the eonth, and ie abont 900 feet in length along its lode line. Shafts have been eunk on this mine, four of which have reached a depth of from 24 to 70 feet, and several lots of ore milled, one of 100 tons milled by the owner gave returne of $7 per ton, and theee excavations with many open cuts ehow a continuous working of over 300 feet. Three hnndred feet of nnreported ground lie between these two prominent ore ontcrops, but the management will locate their main shaft at a convenient point on the lode where both ore bodies can be most economically mined. Work of development will soon be commenced and carried forward continnonsly.

Calaveras.

MAUNA BROS. MINE.—*Chronicle*, Oct. 7: This mine, which is sitnated about 1½ miles from Jesns Maria, is fast developing into a promising piece of mining property. A tunnel bas been run on the vein 80 feet, from the end of which a drift wae started and run north a distance of 50 feet, following tbe foot-wall and the whole length of the drift rock was enconntered that wonld average $4 per ton. From end of drift a crosscut was rnn about 12 feet wben another vein was encountered, two feet wide, the rock averaging $9 per ton. Abont 20 feet from the end of drift a shaft has been ennk to the depth of 70 feet, and the ore that was taken out of the bottom was assorted and milled in tbe Whiskey Slide Mill and averaged $15.50 per ton. It is the intention of the Mauna Bros. to extend the drift some 20 feet farther, when it will connect with the shaft, and tben sink on the lead. The mine is well eitnated for working purposes. Free water power can be had for abont seven months in the year, there is also a splendid mill site and plenty of timber on the gronnd. The work of development is being pnshed rapidly ahead.

Nevada.

AT GRANITEVILLE.—*Herald*: Tbe mining outlook at Graniteville is brightening up. A new mill is being built on the Culbertson ledge, which ie an extension of the National. Twenty men are employed there. The National mine is now working 30 men. The Ethel works 20 men. Work has been resnmed on tbe California mine, with Dana Harmon as enperintendent. Pat Foley, who formerly operated the California, is now interested in a proepect with Phil Hippert. Taken altogether, abont 100 men have employment at Graniteville, and hey will have a good winter.

THE PROVIDENCE.—*Transcript*: Tbis famons mine is wholly owned by five gentlemen—Dr. Liebrick, Peter Tautphans, J. Buttgenbach, W. H. Widman and F. Broekman—all San Francisco capitalists. These gentlemen can trnly claim to be the owners, with probably one exception, of the largest and richest qnartz mine in California, and it is situated in the Nevada City mining district.

BOUGHT A MINE.—*Transcript*: Hon. Jacob H. Neff & Co. have purchased a qnartz mine on Phelps Hill, near Canada Hill, in this mining district. The mine is known as the Santa Rosa and has been prospected eome in years past, the quartz yielding from $5 to $11 per ton. It is a large ledge, the croppings being eleven feet wide, and can be worked cheaply. Adjoining the Santa Rosa is the Alpine, owned by John T. Morgan, D. E. Morgan and others. They have been running a tunnel on the ledge for some time and have met with good prospects.

It is the intention of tbe owners of the Santa Rosa to purchase the Alpine and work both properties as ons. They will open it np thoronghly and erect a big mill. It will be necessary to extend tbe tnnnel only 60 or 70 feet farther to tap the ledge. Although the ore is low grade the ledge is so large that it csn be worked very economically, and the owners feel confident that they have a good thing.

William Floyd, one of the owners, will bs snperintendent, and npon his retnrn from San Francisco will make arrangements for beginning work.

THE MOBILE.—*Telegraph*: Tbe Mobile Company has just had eleven loads of rock crusbed at Gsuthier's mill and the retnrns show that it paid $10.50 a load. The rock came from the surface, and retnrned ss well as the owners expected. This mine is owned by Wm. Dibble and Richard Ganthier, and is situated bstween the Enreka and the Spring Hill. Tbe shaft is down 65 feet and they have a three-foot ledge. The rock in the bottom of the shaft is of a better qnality than that recently crushed.

MINES CONNECTED.—*Transcript*: Tbe Providence, Champion, Wyoming and Nevada City mines are all connected by nnderground passages. Some years ago the drain tunnel of the Nevada City was connected with tbe drain tnnnel of the Wyoming. Later tbe Wyoming and Cbampion mines came together and the Providence and Champion cnt through the wall between tbeir locations. A person csn go down the shaft at the Nevada City mine, on Wood's ravine, and travel underground along tbese tnnnels a distance of nearly two miles, passing under the bed of Deer creek, and finally emerging from tbe month of tbe Providence Company's npper shaft on the hill at the Willisms ranch. It is qnite a novel trip, bnt no one shonld nndertake it without having for a guide an experienced miner who knows the ronte, as a greenhorn is apt to get lost in some of the old workinge.

THE HOME MINE.—*Transcript*, Oct. 7: It is expected that tbe hoisting and pnmping machinery at the Home mine will be in working order by the 20th of this month. The company mean bneiness, and are pntting up machinery capable of working to a depth of 1000 feet. A contract will shortly be let for sinking the shaft 100 feet.

STRUCK IT RICH.—*Herald*: Wben the Blue Jay Mining Company disorganized most of the owners thought there was no obance to make a mine of the Blue Jay. Bnt M. A. Baugb thonght differently, and, secnring a lease of the property, he went to work on it alone. Now he has a eix-foot ledge which will never pay less than $25 per ton, while the specimens he exhibits are worth $20,000 a ton. The rock is very white, and the bright leaf gold sticks ont of it on all sides. Mr. Bangh came down to get a five-etamp mill, and as everything is in readiness for it at the mine, he thinks he can commence ponnding out bis fortnne in a few weeks.

UNWORKED MINE SOLD.—Nevada *Transcript*: Still another of the old, nnworked mines has changed hands, and work on it will be etarted np immediately. The mine is known as the Stiles ledge, which rnns under the prettiest residencee on Broad street, in tbe very heart of our city. The purchasers are Hicke & Co. of San Francisco, and the sale, we understand, was made on Saturday last, the consideration being $10,000. The property has been owned for many years by Daniel A. Rich and his son, Jacob C. Rich. There is a shaft 200 feet deep on Deer creek, below tbe Nevada Fonndry, and from there a tunnel was run up to and abont under the Methodist Church. Tbe croppings of the same ledge are seen on the Nevins lot near the bead of East Brosd street. Some years ago the mine was worked considerably, on a small scale, by tributers, and always paid well, some of the rock milling as high as $60 to the ton. Many years ago, when the mine was owned by the late W. C. Stiles, there was a small steam hoisting plant on the property on Deer creek. A tramway extended from there up the creek and nnder the suspsnsion bridge to tbe sash factory now owned by George M. Hnghes, whicb at that time belonged to Stiles. There was a quartz mill in tbe lower part of the building tben, and here tbe qnartz from the mine was hauled over the tramway in a large car. Stiles worked the mine in this manner for some time, but the hoieting and pnmping rig used wonld not permit of going any deeper, and operations are finally snspended.

Siskiyou.

THE SPENCER LEDGE.—Yreka *Union*, Oct. 4: The Spencer ledge, on Siskiyon mountain, near Cole's, still continues to yield rich-paying quartz, althongh eomewhat narrower at present working, with prospects of widening again on sinking deeper.

The Sterling mine, abont four miles from the Spencer ledge, in Cole's district, on Siskiyou mountain, operated by a San Francisco company, witb a fine new quartz-mill, started up last Saturday, is paying handsomely and bids fair to become one of the most valuable gold mines in Siskiyou.

Some quartz from the Kiernan mine, of the Butterville district, on the headwaters of Shasta river, showed very rich prospects, and bids fair to turn out a great amount of the yellow ore. The shaft has been sunk about 12 feet, with the ledge still two feet in width and prospecting better pay the deeper down the ledge is opened. An arrastre has been put up to crush the quartz, and probably a tunnel may be run into the mountain next snmmer for striking the ledge lower down, where it will also afford good drainage sbould water be fonnd, as will most likely be tbe case.

W. H. Stearns, the enterprising mining man, at South Fork of Scott River, near Callahans, is now engaged in prospecting for an old pay channel by means of drifting. He has run a drift eome 70 feet into the bank and thinks he has fonnd a rich back channel, on which be will commence hydranlic operations next snring, if further prospecting jnstifies his belisf. He has expended already some $8000 in work and machinery, bnt feels confident of soon getting his money bsck, and a good stake besides, when he has plenty of water nsxt spring and snmmer for wasbing down the banks in uncovering tbe pay channel.

The snccess gained in opening the blue-gravel beds at Henley and Greenhorn creek is likely to canse fnrtber efforts in the way of development. It is not actually necessary to delve down to the deepest points in old channels to secnre good retnrns, as rich pay has been realized on reaching the rim and all along the slopes—a fact dsmonstrated by expsrience, especially in old cbsnnels now covered by high land and hills. Tbat a channel of an ancient stream extends tbrongh this county from Siskiyon mountain southward along Shasts vslley and the eastern limits of Yreka basln is firmly believed by many scientific mining experts, and continnes, no doubt, clear down to the Sacramento valley.

Shasta.

THE OKO GRANDE MINE.—*Democrat*, Oct. 4: This mine is situated on what is known as Hostetter Hill, on the east side of Trinity, two and a half miles nortbeast of Carr's ranch, in Trinity. It is the principal mine of a group of six claims at present owned by Jack Strode and brotber, of Whiskeytown. Tbree yesrs sgo this fall Mr. J. Strode and John Bowder located the ground, Mr. Strode baving first discovered the prospect. Together they opened a fine chute of bigh-grade ore on tbe Oro Grande by sinking a shaft and rnnning a tunnel level on the vein to connect with the bottom of the ehaft, which at this jnnction is abont 100 feet deep. A yesr ago thie month Mr. Strode bonght the interest of his partner, Bowder.

Tbe principal development had been done on the Oro Grande, and consists principally of a perpendicnlar shaft 209 feet deep, tunnel level No. 1, 100 feet in length, tunnel level No. 2, 380 feet in length, and sbaft No. 2, 137 feet in depth, which is snnk from the mouth of tnnnel No. 1 to connect with tnnnel level No. 2. Tnnnels 3 and 4 have been started in ore on the vein.

The formation which confined the ore zone in the Oro Grande ie a slate foot-wall and porphyry hanging wall. The width of the wall in all its expoeures was from three to five feet. Mr. Strode fignres 5000 tons of ore in sight in the stoping ground above tnnnels No. 1 and 2. They have let a contract to run tunnel No. 3, which will give a perpendicular depth in line with shaft No 1 of abont 336 feet, and at that point will be 480 feet in on the vein and ore zone. Standing on the gronnd is an inexhaustible snpply of first-class mine timber, and conpled witb a fine water power enables Mr. Strode to prodnce his gold bnllion at a minimum cost.

For abont three months they have been crushing their ore with a cannon-ball mill, and in tbis have worked 119 tons. The firet clean-np, in Jnne last, was 11 ponnds of bnllion; the second, in Jnly, 10½ ponnds; the tbird, on September 11th, which Mr. Strode deposited witb the Bank of Northern California last Friday, was 54 ponnds. The total yield of tbe 119 tons is a little over $21,000.

Tbere is practically no "dead work" in this mine, as all the openings are on tbe vein and in the ore zone. They are now excavating for a five stamp mill, wbicb they expect to have in operation in 60 days.

NEVADA.

Washoe District.

ON THE COMSTOCK.—The following summary of operatione in the leading mines of the Comstock lode is obtained from the official report of euperintendents for the week ended Oct. 7:

From the openings 256 feet sonth from the main shaft, midway between the 1500 and tbe 1400 level of Con. Cal. & Va., we have extracted dnring the week 35 tons of ore assaying about $25 per ton. Have continued making necessary repairs to the drifts on the sill floor of 1650 level. The upraise started in the main northwest drift at a point 57 feet eouth from its junction with the main west drift from tbe C. & C. shaft has been carried np 19 feet; total height 52 feet; top in hard porphyry, clay and qnartz. From tbe drift run eouth at a point 52 feet down from the winze sunk from the crosscut rnn west from the main northwest drift, in working npwards, 16 carloads of ore have been extracted—about 15 tons. The south drift has been extended dnring the week 12 feet; total length 114 feet; face in qnartz. Have shipped to Morgan mill during the week 416 1550-2000 tons of ore, the average assay valne of which, per car samples, was $39.20 per ton. The average assay valne, per battery samples, of all the ore worked at the mill during the week—415 tons—wae $35.20 per ton. Bnllion shipped to Carson Mint, assay valne $16,035.80.

The Union Con. and Sierra Nevada joint north drift, running from the joint west drift at a point 1520 feet west from the shaft, has been extended during the week 19 feet, with the face in clay and qnartz, giving low assays.

Have resumed work on the 1465 level of Mexican, and are now engaged in prospecting by following some narrow streaks of quartz in tbe southern part of the mine. Have continued (jointly with the Ophir compaoy) tbe work of making repaire in the Ophir ehaft. Work has been resnmed on the 1465 level by starting a west crosscut from tbe main north drift at a point 124 feet eonth from the winze station and abont 300 feet north from the main shaft station. This crosscut has been advanced 26 feet and is in a hard porphyry formation. West crosscut No. 5 on 200 level of Gould & Cnrry, started in northwest drift, 432 feet from main west drift, has been advanced 10 feet during the past week, witb tbe formation in face the same when last reported. West crosscut No. 5, started in southwest drift, 100 feet from west crosscnt No. 4 on 900 level of Best & Belcher, has been advanced 8 feet; total length 132 feet; face in hard porphyry.

Tbe sonth winze below the 1000 level of Potosi is down 28 fset on the slope. Tbe bottom sbows 4½ feet of fair-grade ors. Ths nortb drift 28 feet below the 1000 lsvel is out 84 feet. The fsce shows 4 feet of fair-grade ore. Have started a drift north 63 feet below ths 1000 level which is now ont 9 feet. Face is in porpbyry. Extracted and sent to the mill the past week 188 tons and 250 ponnds of ore from the 1100 level. Milled during the week 208 tons. On hand at mill 100 tons and 700 ponnds. Average battery assays $28.61; average car sample assays $32.34. Shipped to the United States Mint, Carson, 482 pounds of crnde bnllion. The north drift 145 feet north of sonth line, 100-foot level of Cbollar, is out 90 feet. Face is in clay and bnncbes of quartz wbich give fsir assaye. Are yet engaged in making repairs to tbe main incline below the 930 level. Advanced east crosscut on 900 level of Hsle & Norcross from winze 3 feet; total length 34 feet. The face of the crosscut has rescbed tbe east clay. Sinking was resumed in the winze during tbe week and the winze sunk 5 feet; totsl depth 28 feet. Extracted 8 cars of ore; average assay valne per csr samples $25.67 per ton.

THROUGH THE OLD SHAFT.—Virginia *Chronicle*, Oct. 10: The Con. Virginia Mining Company are preparing to once more work thie mine throngh the old Con. Virginia sbaft. Abont eight or ten men are employed in and abont the old works making repairs to them. A new gallows frame, foundation and all, is being pnt in, and the scene in the hoisting room, carpenter ehop and yard, where tbe men sre getting timbere ready, is livelier than for a long time. It is qnite a while now since this shaft was sbut down, and the reopening of it will be a pleasnre to record.

The work going on now marks the inception of two new departnres in mining. Wben tbe shafts and drift have been cleaned ont, not only will work be resnmed in the npper levels of the Con. Virginia, but the West Con. Virginia will also work its ground tbrongh this shaft. If Rnle's echeme is carried ont and the West Con. people engage in mining on any considerable scale, a good many men onght to be put to work here. It will be some little time, bowever, before tbe repairs will be finished and the ehaft opened.

Bruneau District.

THE BEUNEAU MINES.—Winnemncca *Silver State*: The Brnueau river, lying partly in tbe nortbern part of Elko connty and distant from the town of Elko from 80 to 90 miles, containe very rich gold placers. These discoveries have been made in tbe laet few weeks. In the latter part of Jnly, J. A. McBride of Elko and Captain Penrod of Island Mountain were ont on a hnnting trip on the Brnneau. Mr. McBride was born and raised among the rich placer mines of Placer county, California. When thev strnck the Bruneau river it presented to McBride the characteristics of a ricb gold field. He told his companion of his opinion, and eoon after their retnrn two parties went out and made several excavations in the bottom lands with the most encouraging resnlts, although on account of water tbey conld not reacb bedrock. McBride sent ont another party to prospect at another point on the river eome distance below where the otber parties had located, whicb resnlted in finding coarse wash gold in paying qnantities in the gravel from near the surface to bedrock. The bed of the river is from 1000 to 2000 feet below the summit of the mountains on either eide, and at several points the river passes throngh narrow gorges of almost perpendicnlar walls. Nnmerons gnlches from three to twelve miles in length, on both eides, carry great quantities of water into the main river from the mountain heights, and donbtless all these contain gold in paying qnantities.

Any power desirable for hydranlic mining can be had not only from the watere of the river, but from many of these gnlcbes during the wbole year. Denver capitalists have lately purchased several thonsand acres of placer ground on this side of the summit and are preparing to engage in extensive mining. Their gronnd extends from near tbe summit down some ten miles toward Elko. Parties are mining in eeveral gulches beyond the snmmit, which run into the Brunean river.

Althongh placer mining to the south and near the Brnnean has been carried on for the last fifteen years or more in a belt fifty yards wide, there is no evidence that any prospecting has been done on the river prior to the late discoveries. It wonld seem that the river itself ought to have long since invited the sbovel and pick. The water courses along an immense fissnre of great depth and crosses the extensive belt of mining country above named. No place between the Sierras and Cascades on the one side and the Rocky mountains on the other, ehows snch violent and immense force in the upheavals from the eomber depths as the country along the Bruneau river. On some of the heights great forests of timber are found, with trees 150 feet in height and several feet in diameter, but they are inaccessible to man, except on foot and by tbe most laborious climbing up rocky and precipitons chasms.

Yellow Pine District.

TO THE EDITOR:—We are almost daily in receipt of favorable reports abont the new gold camp at Crescent, which is 18 miles northeast of Vanderbilt by wagon road, and 13 miles by trail. Twenty men are at work developing the property, and several of tbe concerns there are making arrangements to ship ore to our road. There is also some new activity in the Yellow Pine mining district about Good Springs. This is an extensive lead district, and the increase in the price of lead will help to open up some of the lead mines, as I bave been engaged

In obtaining bids upon several lots of ore for intending shippers at Keystone, which is just southwest of Good Springs and east of Mesquite Wells. The Keystone Mining Company has finished its ten-stamp mill, which started in operation the 20th inst, and has been running successfully. This company has shipped eight carloads of high-grade ore to Pueblo Smelting and Refining Company during the month of August.

GEO. C. MANLY,
Sec'y Nevada Southern Railway Co.

White Horse District.

The Wadsworth *Dispatch* says: The Jim Blaine shaft is now 50 feet deep and a ledge of fine looking substantial quartz has been struck. The prospects for a first-class mine are very bright, and ere long that which White Horse district needs will be established, where ore bodies of good-sized ledges of pay rock can be found by sinking for them. The Jim Blaine is there to stay and demonstrate that there is long life in the camp and reward for the investors.

ARIZONA.

NOTES.—Mohave County *Miner*: Henry Brown is getting ont very nice gold ore from the Eagle mine.

Joe Pomber had five tons of ore from the Prosperity mine worked at the sampler Monday.

The Diamond Joe ore will probably be worked at the Kingman sampler next week. The ore will probably average about 350 ounces per ton in silver.

The Kingman sampling works, since it resumed business, has paid out thousands of dollars for ore. The starting up of the works has been a great convenience to miners who would otherwise be compelled to ship their ores and wait nearly 60 days for returns.

OREGON.

NOTES.—Jacksonville *Times*, Oct. 6: John Bailey and Ed Layton have pounded out $950 worth of gold from rock taken from a claim they have located in Williams Creek district. The claim is on an extension of the Bone of Contention ledge, upon which they have sunk a 12-foot shaft. The ledge is from 12 to 18 inches in width and can be traced several hundred feet.

W. H. Hampton of Portland, the mineralogist, who has secured the Dysert and other properties in Grave creek district, Josephine county, is making preparations to commence the construction of a ditch 15 miles long. This will furnish an ample supply of water, all that is needed to develop one of the richest placer mining districts in the Northwest.

The Siskiyou Quicksilver Mining Co. is making arrangements to run 500 feet of tunnel, and has levied another assessment of one cent a share to raise funds with which to prosecute the work. Mr. Newcomb, who owns a controlling interest, seems to be of the opinion that cinnabar exists in paying quantities, and that the projected work will establish the fact.

NEW MEXICO.

NOTES.—Southwest *Sentinel*: At Georgetown there is very little doing, in fact that camp is the dullest at present that it has been known to be for years. There are but 20 men employed in the entire camp and 15 of them are working on the Pheby mines.

Two bars of bullion arrived from the Colonial Mining and Milling Company on Thursday, and one from Brockman's mine at Lone Mountain.

The Western Belle, at Gold Hill, is looking up in fine shape. It furnishes employment to about 20 men, and the Standard mill is kept in constant operation on the ore it produces. The gold bullion is shipped by express, while the concentrates are shipped through Lordsburg by freight to the smelters.

Casay & Thomas, the millwrights, are pushing the construction of the new mill which will handle the ore produced by the Mountain Key mine at Pinos Altos. Walker & Climo are working about 30 men in the mine, and as soon as their mill is put into operation this number will be greatly augmented. The mill will be completed about November 15th.

The Langston mine, at Pinos Altos, has been temporarily closed down, but will resume again as soon as Mr. Watson returns from the East.

The Aztec tunnel is nearing completion, and when this mine is again opened up a large force of men will be employed in its operation. This will again be one of the finest properties in the Pinos Altos district.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 12, 1893.

The course of the silver market has remained undisturbed during the week, and prices have shown only slight fluctuations. The probability of a compromise in Congress on the Repeal bill seems to have no effect one way or the other.

Quicksilver Trade.

The receipts of quicksilver at this port have been as follows:

Months—	1893.	1892.
January	2,243	1,701
February	2,388	1,543
March	1,588	1,875
April	1,623	1,901
May	2,511	1,598
June	2,790	1,614
July	2,014	1,632
August	1,909	2,013
September	1,281	1,753
Nine months	18,347	15,630

Against 9921 for the first nine months of 1891, 9392 in 1890 and 11,464 in 1889.

Coming Rise in Copper.

In copper-dealing circles the belief in higher prices in future is general, and would, moreover, appear to be based on sound reasoning, says London *Money and Trade* of Sept. 27th. The visible supply in Europe is now extremely small—under 49,000 tons, these figures including an estimate of the quantities advised as on their way from Chili and Australia. Prices are also unduly low for this season of the year; but the main reason for expecting a fairly sharp rise lies in the rapidly-changing position in the United States. Owing to the financial stringency there, the Lake companies supplied Europe with exceptionally large quantities of copper at low prices, the total exportation for August amounting to 9040 tons, and during the first fortnight in September the exports continued on a fairly good scale. These extra supplies appear to have been easily absorbed, Germany proving an especially free buyer both for cash and forward delivery. There is a positive scarcity of cash copper here, and during the remainder of the season only small shipments from the States can be looked for. Stocks there are admittedly low, while a good demand is confidently anticipated, now that all currency difficulties are disappearing. It is probable, moreover, that the Anaconda properties will be closed down.

Silver and the Metals.

NEW YORK, Oct. 12.—Following are the closing prices for the week:

	Silver in Loodon.	N. Y.	Copper.	Lead.	Tin.
Thursday	33⅞	73¾	9 50	3 60	.....
Friday	....	....	9 60	3 60	20 90
Saturday	33⅞	73⅛	9 60	3 60	20 90
Monday	33⅞	73¾	9 60	3 60	20 50
Tuesday	.34	73¾	9 50	3 60	20 60
Wednesday	.33⅞	73¾	9 75	3 60	20 55

The Stock Market.

SAN FRANCISCO, Oct. 12, 1893.

A very emphatic change for the better has taken place in the mining share market during the week. The reason is mainly the claim of James E. Rule that he knows of the existence of a body of rich ore on the 1100-foot level, old Consolidated Virginia shaft, which he proposes to uncover. Rule's private claim is that while acting as superintendent for Hon. J. P. Jones, who had a lease of the upper levels of the Consolidated California and Virginia in 1884 and 1885, he discovered a new vein of ore above the 1100-foot level, assays of which went $500 per ton. At the time of its discovery he says he had a quarrel with the Jones people over his remuneration for services, and left their employ. This is a well-known fact, and Rule also brought suit against Hon. J. H. Jones, which suit was afterward compromised. He says that during the period of the quarrel he withheld information about the strike of ore, and that that part of the mine where the discovery was made was abandoned, and the drifts soon closed. He now wishes to reopen a certain level above the 1100, and asks for 00 compensation until he has found the ore.

The bullion shipment of the Consolidated California & Virginia for September is as follows: Worked at Morgan mill 1712 tons of ore. Bullion produced: Gold, $25,260.27; silver, $18,573.09; total, $43,833.36. Yield in bullion per ton: Gold, $14.75; silver, $10.84; total, $25.59. Assay value of the ore per ton per battery sample: Gold, $13.86; silver, $12.97; total $26.83. Assay value of the ore per ton, per railroad car samples, $29.55. At the office of the company it is estimated that the mine earned last month at least $5000 over and above its expenses.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DEVICE FOR ENABLING MOVING BODIES TO PASS OBSTRUCTIONS.—No. 506,037, dated Oct. 3, 1893. George H. Forbes of San Francisco, assignor of one-fourth to George P. Parker and Leo Allenberg of same place. This device consists of a rotatory section having a sliding connection with the load. The section has radial spaced arms, between which it encounters the obstruction, and being thereby rotated, it passes over said obstruction. This section may be a wheel supported upon a track, or it may be one which unites, by a sliding connection, a portion of a frame above and below, as, for example, a cable grip, thereby enabling the whole grip to pass a crossing cable.

COMBINED TRUNK AND DRESSING CASE.—No. 506,033. Dated Oct. 3, 1893. Walfrid Burkman of Tacoma, Washington. The object of this device is to provide a traveling trunk and dressing case combined, in which everything placed in it can be easily found without disturbing articles not wanted, and at the same time to have a cheaply constructed, light, durable and strong trunk. The device is in the shape of a cylinder. It is divided interiorly by a longitudinal partition into two compartments. On one of these garments are to be hung up. In the other shelves are placed to lay garments and other articles upon. In one end of the trunk is a socket and accompanying the device is a portable base with a pin. The trunk when upended is pivoted on the pin and can be axially turned for convenient use as a dressing case.

BUBOLAR ALARM.—No. 506,040. Dated Oct. 3, 1893. Andrew Hartman of Hawthorne, Nevada, assignor of one-half to Charles H. Reynolds of San Francisco, Cal. This alarm is a spring actuated gong which is set in operation by a tripping mechanism lying in the path of movement of the door or window or other entrance. The tripping mechanism is adapted to be readily set out of use when not required, so that the opening of the door will not affect it. But at night it is quickly set back in position again.

Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from Louis Conrath, attorney in fact for the Excelsior Water and Mining Company, for permission to mine by the hydraulic process in the Blue Gravel Placer mine, near Smartsville, Nevada County, California, and to deposit tailings in an old hydraulic pit, hereby gives notice to all concerned that a hearing will be held at the office of the Commission, room 92, Flood Building, San Francisco, on October 17, 1893, at 1:30 o'clock P. M. On and before this hour and date all parties interested may file affidavits, plans, and maps, in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from H. Buckley and Louis L. Hillman for permission to mine by the hydraulic process in the Illinois Gold Gravel Mine, at Secret Diggings, near La Porte, Plumas county, California, and to deposit tailings in an old hydraulic pit, hereby gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on October 24, 1893, at 1:30 o'clock P. M. On and before this hour and date all parties interested may file affidavits, plans and maps, in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary of the Commission.

$1000 WORTH OF LAW FOR $1.50.

"How to Be Your Own Lawyer" is the title of a book of over 500 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or anybody else would want to know about, and if carefully studied and kept at hand for consultation when needed will save any man, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, $1.50) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of $1.50.

Address THE DEWEY PUBLISHING CO.,

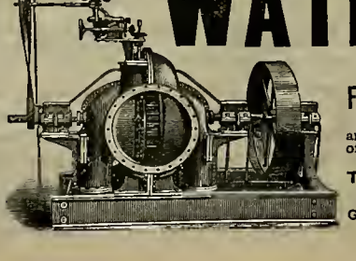
WANTED—A PARTNER

TO TAKE OUT PATENTS IN FOREIGN COUNTRIES on Endless Self-Laying Tracks for Vehicles and Trains. A. P. ANDERSON, Oriental, Nev.

GUARANTEED



WATER WHEELS

BUILT BY THE JAMES LEFFEL & CO. WITH 30 YEARS EXPERIENCE.

UPRIGHT AND HORIZONTAL.

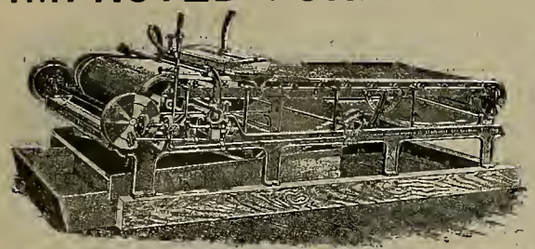
FOR MINING, ELECTRIC AND IRRIGATING PLANTS.

Easy working gates, highest percentage of power and regular speed at all gateage. Equally adapted to high and low heads. 110 sizes and styles. Write us, give number of feet head and size of stream, state what kind of mill you have, and we will send fine pamphlet.

THE JAMES LEFFEL & CO., SPRINGFIELD, OHIO, AND NEW YORK CITY

GEN'L AGENCIES: FRASER & CHALMERS, CHICAGO, ILLS., AND PARKE & LACY, SAN FRANCISCO, CAL.

IMPROVED FORM OF "TRIUMPH" ORE CONCENTRATORS.



The annexed cut illustrates the "TRIUMPH" CONCENTRATORS, and shows the recent improvements which have been introduced into their construction, by which many advantages are gained over any other form of Vanners, Vanning Machines or Concentrators.

These advantages are obtained by reason of the fact, as will be observed, that the crank-shaft is now placed and fitted at the head of the Concentrator, clear of the belt and in direct view of the operator or attendant. This, of course, greatly facilitates the oiling of the bearings of the shaft and connecting rod and precludes the possibility of any sand or detritus, passing over the belt, from reaching or getting into the bearings.

The forms of the bearings and as well of the connecting-rod brasses have also been very much improved, making them stronger, simpler and more easy of adjustment. Important changes have also been made in the feed screw and quadrant for regulating the belt, with the view of making all parts of the machine stronger, more accessible and as easy of regulation as is possible.

We furnish the "TRIUMPH" Concentrators with either the plain or "Blasdel" Riffled Belt and shall be pleased to quote prices with the adaptation of either, as may be requested, and shall further be pleased to show one of the improved form, set up ready for operation, at our office.

REDDING, CAL., April 22, 1893.

Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco, Cal.—Gentlemen:—Following the testimonial letter which I addressed to you December 9th, 1890, in relation to the superiority of the "Triumph" Concentrators over either the "Frue" Vanners or "Woodbury" Concentrators for concentrating our Texas ores, I hold now to the opinion then expressed; and with nearly two years and a half further experience in their operation I can confidently assert and am more fully convinced than then, that the "Triumph" Concentrators are better in all respects than any other form for concentrating our Texas and Bully Choop ores, and in evidence of such confidence I refer with pleasure to the order recently placed with you for four (4) of the "IMPROVED TRIUMPHS," to make up the complement required for use in the new twenty (20) stamp mill at the "Cleveland Consolidated Mining Co.'s mines in Bully Choop Mining District in Shasta and Trinity Counties, this State, and I feel assured that the improvements lately introduced into their construction will make them even better than the old form which I have had in operation for so many years past in the different mills under my supervsion. I am, very truly,

(Signed) R. G. HART, Sr., Manager Texas and Cleveland Cons. Mining Co's.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

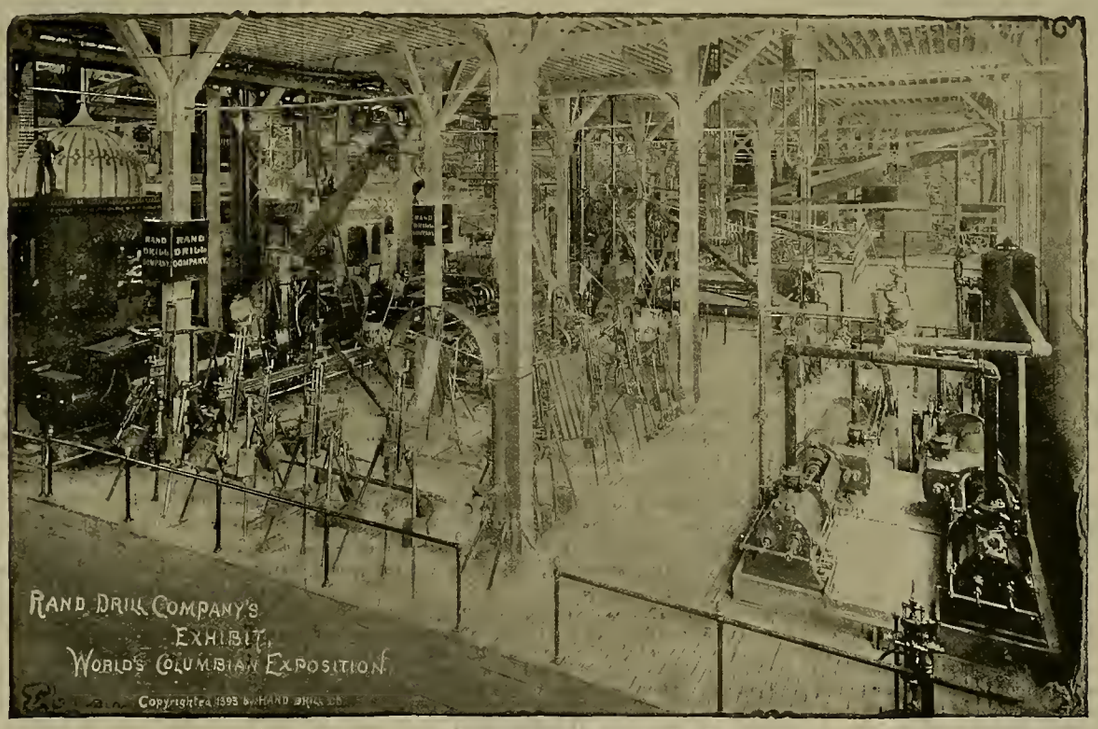
The Rand Exhibit.

Besides the large air compressor in Machinery hall at the World's Fair, of which we presented an illustration last week, the Rand Drill Company has on exhibition in the Mining building a full line of mining machines manufactured by them. The exhibit of rock drills covers a range from the largest used for submarine and heavy contractors' operations, to the smallest, used for block holing and plug and feather work. These sizes are shown in the three different classes, namely, the "Little Giant," the "Slugger" and the "Economizer." They also represent the recent improvements that have been made in valve movements, in the cylinder heads and packing rings. The valve movement of the "Economizer," to which special attention is called, is arranged so as to cut off automatically the admission of air into the cylinder at a certain point and use its expansive force to complete the stroke; thus, it is claimed, doing as effective work as the drill that uses the full pressure of air the full length of the stroke, with a corresponding saving. The new style of head, in which is used only a cup leather ring, instead of the old style of stuffing box and gland, is an improvement that will be appreciated by mine managers and master mechanics.



THE RAND DRILL COMPANY AT THE WORLD'S FAIR.

In the exhibit also is a full line of tripods, columns, shaft and quarry bars, on which the drills are mounted. There is also shown a new style of drill bit made by the company, which is a tube of steel turned at one end to fit the drill chuck, and at the other end arranged to have the hardened steel point fastened on. These points are shaped like the regular X bit, and are furnished by the company at a very low cost. The removal and attachment of the point is very simple; it is pressed on to the drill by a machine which the company provides, and is fastened so firmly that there is no danger of its coming off while in operation, if proper care has been taken. The advantage claimed for this bit is that the current of air which is allowed to pass down through the piston and drill bit when on its downward stroke forces the rock cuttings of the previous blow out of the hole and allows the drill point to strike on the solid rock each time, instead of having the impact force of the blow reduced by striking into and pulverizing the previous cuttings or working in mud.

On the Duplex air compressor, which is shown in this exhibit, a special feature well worth noting is the mechanical valve arrangement for operating the air inlet and outlet valves. This valve motion is operated through a gear and pinion motion and compound springs, by which the inlet valve is opened at the beginning of the stroke and held open till the stroke is completed, thus insuring a full cylinder of air at atmospheric pressure. As soon as the compression stroke is commenced the valve closes, and when the air in the cylinder has been compressed to the same pressure as in the receiver, the outlet valve, from which all external spring pressure has been relieved, opens and allows the air to pass to the receiver. By this movement it has been possible to reduce the number of valves to a minimum and still insure a perfect filling and discharge of the air cylinders. The valve stems are made extra long, and work in long bearings, thus insuring a perfect and even seating of the valves at all times.

Another compressor is exhibited which attracts much attention from those interested in the compression of air or gases, such as oxygen or carbonic acid gas, to high pressures for transportation. Several of these machines are already in operation compressing gases to pressures ranging from 2000 to 4000 pounds per square inch. This compressor is of the upright cylinder type. The compression is carried out in three cylinders, all of which are inclosed in a water-tight tank, of cast iron, open at the top, through which a constant supply of cold water is circulated, insuring the cooling of the gas or air as the compression increases. In operation, the first compression is made in a double-acting, low-pressure cylinder, from which the gas or air passes into a small receiver placed alongside the cylinders, and also surrounded by the water in the tank; from this receiver it passes into the middle cylinder, then through a coil of copper pipe around the inside of the tank and into the high-pressure cylinder, from which it again passes through a coil of pipe in the tank into the high-pressure receiver placed outside, from which it is drawn into the cylinders in which it is shipped. The middle and high-pressure compression cylinders are single-acting hydraulic cylinders made especially for the purpose. These machines are fitted with special high-pressure joints in which no packing of any kind is necessary, and which are always tight under the highest pressures attainable, and which can be taken apart as often as required without impairing their efficiency. Other compressors of the usual kind adapted to various uses are exhibited here.

THE annual report of the African Gold Recovery Company, Ld., operating by the MacArthur-Forrest (cyanide) process in South Africa, says that the company's business has continued to steadily progress, and the MacArthur-Forrest is now recognized as the essential factor in increasing the gold extraction in South Africa. The total Rand output for the year ending June 30, 1893, apart from the process, was 1,087,058 ounces. By the process this was increased by 226,087 ounces, making a total of 1,313,136 ounces. From districts not included in the Rand a further recovery of 2395 ounces was returned, making in all 228,473 ounces due to the working of the process. It will thus be seen that, by the use of the process, the Rand gold production was increased by 21 per cent. If individual returns are examined, the benefit and value of the process is still more forcibly demonstrated. These show that at several of the leading and most prosperous mines 35 per cent to 50 per cent of their gold output is due to using the MacArthur-Forrest process. At June 30th last the process was in operation at 31 mines, and since that date others have arranged to adopt it, mostly on a large scale. After writing-off for depreciation £15,183 5s 3d, there remains the sum of £74,663 13s 4d, out of which three quarterly dividends have been paid, absorbing £26,250. A profit of nearly $350,000 per annum in any enterprise is certainly a very fine showing.

THE silver repeal bill is no nearer passage than two months since; indeed, not quite so near. The contest of "physical endnrance," inaugurated last week by Senator Voorhees, ended in a fiasco, and the Senate is still talking. The air is full of compromise. It looks now as though it must be that or nothing.

THE director of the Lick Observatory has been notified by telegraph of the discovery of a comet at Geneva, N. Y., on Oct. 16th, at 21 hours Greenwich time, its position was R A. 12 hours 21 minntes; and Dec. north 12 degrees 55 minutes. Its motions were northeast.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Rand Drill Company at the World's Fair, 257.
EDITORIALS.—The Rand Exhibit; Miscellaneous, 257. Miscellaneous; Wages on the Comstock; Work of the Debris Commission, 258. What was the Output? Ore Deposits of the United States; Rule's Proposition Accepted; The Flour-Gold Problem; Miscellaneous, 260.
MISCELLANEOUS.—Slickens; Foundry Notes, 529. Coast Industrial Notes, 269.
CORRESPONDENCE.—Small and Chinese Mines, 259. Chinese in California Mines, 260. Studies in Gold-Milling; The Tuolumne County Fair, 261. Origin of the California Stamp, 262. The Mineral Lands, 263.
MECHANICAL PROGRESS.—Things to Remember About Shafting; New Small Arm for the Navy; Knife Edges for Balances; A Great Bridge, 264.
SCIENTIFIC PROGRESS.—Proposed Sixty-three Mile Light; Device to Prevent Collisions; To Ascertain Loss of Head; Practical Use for the Krytophane; Scientific Facts; Differences in Thermometers; Early Chinese Civilization; Delicate Rain Gauge, 264.
ELECTRICITY.—Electric Development Since 1876; A Frolic of Lightning; An Electric Fire Engine; Increasing Towing Power; Electric Mining Plant, 266.
USEFUL INFORMATION.—Mineral Statistical Column; Cure for Snake Bites; Recipe for Painters; New Process of Galvanizing; Lew Wallace's Royalties, 267.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 269-270.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 271.

WHAT shall be done with unsold shares of delinquent stock? is becoming a pretty serious question with some of the Comstock companies. Stockholders display about as much unanimity in declining to pay further assessments as they did in making the original investment, and until there is a better outlook at the mines, or improvement in mine management, there is little chance of a more amiable frame of mind on their part. The Hale & Norcross Mining Company holds 26,451 shares of its own stock, and it had a special meeting the other day to decide what to do with it. There were about 72,000 shares represented at the meeting. Three propositions were made for the disposal of the stock. Attorney Wells wished it divided among the other shareholders. E. Tingman thought it should be retained on the books of the company pending a higher market value, and J. W. Twiggs moved that the stock be sold at the Stock Board at no less than 50 cents a share. The latter suggestion was adopted by a vote of 63,278 shares. Recent quotations for Hale & Norcross have been 40 cents. September 7th the figure was 55 cents.

IT is said to be the intention of the House Committee on Ways and Means, now at work on a new tariff bill, to place coal, lead and iron on the free list. The manufacturers of California have no particular objection to free entrance of coal. Indeed, a petition, quite largely signed by local manufacturers, asking removal of the tariff duty, was several months since forwarded to Congress. It is likely, also, that removal of the duty on iron ore would not be regarded as an unmixed calamity by local interests. But the duty on lead is quite another thing. It is 2 cents per pound for pig lead and 1½ cents for lead-silver ore, with ten per cent advalorem added. With lead selling in New York at 3½ cents per pound, or less, lead-silver miners do not feel that they are in position to stand foreign competition.

AMONG other mines proposed to be operated under the Caminetti law are several at Spanish Ranch, Plumas county, which the Debris Commission has recently examined. The Quincy Mining & Water Company has recently been organized for that purpose. These mines were enjoined by the courts, but it is believed that there will be little trouble in impounding the debris. Favorable action by the Commission is confidently hoped for.

THE bill suspending until October of next year the operation of law requiring $100 annual assessment work on mining claims has passed the lower House and is now before the Senate, where, it is said, it meets with opposition. The miners of the Black Hills, South Dakota, insist that the benefits of the bill shall not extend to non-residents.

Wages on the Comstock.

The Comstock wage question would seem to be settled, so far as the miners' union is concerned. Final action was taken last week by the Virginia and Gold Hill Miners' Unions by joint ballot. Polls were opened from 11 to 7 o'clock, and 416 votes were cast; 229 were for $4 and 187 for $3.50. The $4 men won the fight by 41 majority.

It is to be regretted that some more satisfactory termination to the difficulty was not reached. It is not pretended that reduction of miners' wages is the great desideratum toward putting new life into the lode, but it was a factor.

It is not inappropriate in this connection to say a word about labor unions generally. The one vital defect in such organizations is that they seldom know when to make concessions. They find it exceedingly hard to adjust themselves to changing times and circumstances or to adhere to anything but an inflexible scale of wages that must be paid by an employer whether his business is prosperous or not. In times of general depression the unions have more or less trouble in maintaining their own wage scale. Competition is very keen because of the large numbers of unemployed and the natural tendency is toward a lower wage basis. The politic thing for unionism to do would be to render its rules more flexible, and, in many instances, to lower voluntarily its wage minimum, temporarily, or even without condition. The unions seldom do this. They attempt to hold their own without concession. The idle in their own ranks increase and soon make trouble. The employer finds it easy to make terms with this class. The unions are weakened and may be destroyed. It becomes easy to reduce wages of union men without the union's consent. It has become with the union a question of less remuneration or no work, and it must acquiesce. There are no strikes in hard times.

Of course there are exceptional cases like the Comstock miners. But it is evident from the vote last week that here is a large minority which is willing to work for $3.50 per day instead of $4. There seems to be no present prospect that there will be greater activity on the Comstock; and, if not, it is obvious that this minority will grow in sentiment and numbers. It is not designed here to defend the employing class and its method of operation on the Comstock, but simply to point out what it will be enabled to do unless the present status of matters is changed. The miners have already weakened their own cause, and Comstock operators will be the better equipped to wage war on the union, if they so desire.

THE Colorado papers are industriously at work landing Cripple Creek as the "greatest gold camp ever discovered." The situation has recently been such in Colorado that a reasonable amount of exaggeration is perhaps to be overlooked; indeed, enthusiasm over their gold fields is not only natural but commendable. Nevertheless, people who have not the fortune to live in Colorado may be excused for hesitating to accept without a grain of salt the Colorado view of Cripple Creek. It is undoubtedly a very promising camp and has a fine future, but we do not think the following statement, found in a local paper, altogether true:

"The C. O. D. mine of Cripple Creek is working four men at $3.50 per day. In sinking the shaft they take out five tons per day of gold ore, worth $100 per ton. This is equal to 25 ounces of gold at $20 per ounce. Deducting $20 per day for total expenses leaves $480 as the product of a day's labor. This gives the following results: Total product for one day, 25 ounces gold; total cost per ounce, 80c; total cost on the dollar, 4c."

Of course Colorado papers themselves do not all accept such statements seriously. They should do all they can to discourage their circulation. In the end, it will be found that they do much mischief.

AMONG awards at the World's Fair in the mining department are the following: For history and literature of mining and metallurgy, MINING AND SCIENTIFIC PRESS; California State Mining Bureau, reports of the State Metallurgist of California; Copper Queen Consolidated Mining Company of Bisbee, A. T., series of models of Copper Queen mine, model illustrating the manner of timbering sloped ground with square set model in glass and wood, clearly defining the horizontal and vertical sections of underground work.

PRESIDENT J. H. NEFF of the State Miners' Association has appointed the following to act as an executive committee at large in arranging a Midwinter Fair exhibit: J. J. Crawford, Colonel Frank McLaughlin, Professor S. B. Christy, S. K. Thornton and W. C. Ralston. Mr. Neff has also appointed an advisory committee of three gentlemen to confer with the executive committee, consisting of Hon. R. McMurray, J. Z. Davis and W. S. Chapman.

Work of the Debris Commission.

The number of applications to mine under the Caminetti law is steadily increasing. Since the organization of the Debris Commission, thirty-one different mines have either made formal application or have inquired how to proceed in order to secure the necessary license. Thirteen formal applications have been made, and hearings have been had in five. One permit has been granted—the Farrel mine, in Nevada county—while Messrs. Mooer & Boyd, of the Kelly Hill mine, Butte county, have been directed to go ahead with construction of their dam, the plans for which have been approved by the commission. When finished, and if built in accordance with the plans, the necessary permit to hydraulic will be given. The Farrel mine is already in operation, behind old impounding works, which have been improved and repaired; and the commission has just issued the necessary permit for the construction of two additional feet on the dam.

The thirteen mines which so far have applied formally for license are as follows:

Kelly Hill mine, Butte county.
Farrel mine, Nevada county.
Omega mine, Nevada county.
Brandy City mine, Sierra county.
Blue Nose mine, Pilot Peak, Plumas county.
Blue Gravel mine, Yuba county.
Illinois mine, La Porte, Plumas county.
Phœnix mine, Hepsidam, Sierra county.
Eureka mine, Downieville, Sierra county.
Craycroft mine, Downieville, Sierra county.
Excelsior mine, Downieville, Sierra county.
Bean Boys mine, Clipper Mills, Butte county.
New York mine, Sierra City, Sierra county.

Part of these applications have been advertised and others will follow in due form. No doubt a large part of the remaining mine owners who have placed themselves in communication with the commission will sooner or later conform to the law by regular procedure. The commission is beginning to find its hands full of work, and excursions to the sites of mines are becoming frequent.

It is significant that nearly all the above thirteen mines have been operated before, and many of them were closed down in consequence of the Sawyer decision. Of course all are ready to take proper care of their tailings, and various devices for that purpose are suggested. The Craycroft mine, for instance, on the north fork of the north fork of the North Yuba, submits a sketch of fifteen dams which can be placed in series at various locations along the stream. It is probably not designed to use all these dams, but only as many as the commission may think necessary to protect the streams and riparian interests. No mine will be allowed to operate without the proper guaranty that tailings will be cared for. At the same time, the commission will impose no undue or unnecessary burden upon the miners. Masonry dams will not be required, except, of course, in special instances. It will doubtless be found that brush dams will be wholly adequate in the majority of cases. The Caminetti law was framed for the purpose of giving hydraulic miners an opportunity to resume work. The commission will fully carry out the spirit and intent of the law, having full regard for the interest of the miner and the welfare of the farmer. It is a fact that no application to mine has yet been rejected. Doubtless they will be. But none will be until the applicants have had a fair chance to demonstrate whether or not their tailings can be safely impounded.

Lieut. C. C. Gillette, assistant engineer of the commission, has entered upon the discharge of his duties. Mr. Gillette is a competent engineer whose experience has qualified him for work in this field. He was graduated from West Point in 1884, and remained 2½ years at Willets Point, near New York, in the engineering service. He was then made assistant to Col. Merrill, who had charge of part of the Ohio river and tributaries. He was engaged for a large part of five years in work on the Muskingum river, also, constructing brush dams. He was later engineer officer of the Department of the Missouri, in General Miles' staff, stationed at Chicago. Mr. Gillette's experience on the Muskingum in the construction of dams will be of value to him here.

THE executive committee having in charge the collection of a State mining exhibit for the Midwinter Fair has already begun its preliminary work. Consultations have been held with Fair officials and an allotment of 10,000 square feet of space secured in Machinery hall, adjoining the mining machinery exhibit. The design now is to make it the most complete and elaborate showing of California's mineral resources ever before undertaken. The executive committee is not yet able to announce the exact style of exhibit but it will be formidable in quantity and choice in quality. The task of securing the material will be comparatively easy, but it will be necessary also to secure sufficient funds.

Small and Chinese Mines.

[By Charles G. Yale, United States Mint Statistician.]

In view of recent suggestions for the unemployed men in this city to go to the mountain counties and work in the old abandoned diggings, it will be well to inquire as to the proper localities, if the idea is at all practicable. Personally, I do not believe it is, for several reasons. Most of these men know nothing whatever of mining and would make a poor flat of such work. They have no implements, own no ground, have no cabins or places to stay, no outfit of any kind, such as blankets, provisions, etc., and if helped to get to old mining camps would not know what to do when they arrived. Moreover, the winter is just approaching and the snows of the mountains would greatly retard work, so that most of the men would soon become discouraged.

Another thing, too, many of the old claims have been worked over and over again by Chinese, who are very skilled at this sort of work, and even they now find such ground rather scarce—that is, ground which will pay.

However, it may be that some men would find ground where they could make $1 to $2 per day during the proper season. They must work on placer, or surface ground, though, for it takes money to work a quartz claim when it is found, and the miners nowadays are not abandoning any ledges that will pay at all. These unemployed men could find no work at the "going mines," because there are more miners now in the State than can find steady work, many having lately come here from silver camps in other States. If they go to the mountains they must depend on their own exertions; must find the ground, get a place to sleep, cook, etc., and obtain picks, shovels and other tools, all of which is rather difficult for a man who is "broke."

I want to call attention, however, to the fact that a large part of the gold product of this State still comes from the "small mines," and the gravel diggings in the rivers, banks, ravines and gulches. Around every mining locality are numbers of small claims operated by a few men, and the aggregate product of such claims foots up a tidy sum every year.

The Chinese, too, take out a large sum in gold annually. It is very difficult indeed to obtain any accurate figures of products of mines operated by Chinese. Of course they never answer any circulars of inquiry, and seldom disclose anything about their operations. The merchants, bankers, gold-dust buyers and express agents of different localities, however, are able to make an estimate of the product of the small mines and the Chinese.

All these figures are collected by the United States Mint for the report on the product of the precious metals issued annually by the Director of the Mint. From the data available from this source I have set down the product of the small mines and Chinese miners of the different counties in the State. It will serve at least to indicate where most of the small mining and Chinese mining is being done. It will serve also to draw attention to the importance of these small mines, when considered in the aggregate, and to show what the Chinese are getting out of the auriferous gravels.

Of course many large claims leased from white men are now worked by Chinese, but these are omitted in these tables. The claims bear American names, and it is not always possible to know them from white men's claims. No consideration either is given to any producing mines (of which there are numbers) which may not be classed as "small mines or Chinese."

As will be seen, the aggregate product of these small mines and Chinese miners equals about one-third of the total gold product of the State. The figures are based on those of last year's product, and are for gold only, the silver yield not being considered.

County.*	Total Product.	Small Mines.	Chinese Mines.
Amador	$ 1,210,383	$ 88,066	$ 9,400
Butte	388,848	69,652	45,762
Calaveras	794,681	78,029	15,085
Del Norte	4,000	4,000	.....
El Dorado	198,321	114,482	67,330
Fresno	112,981	100,900	7,731
Humboldt	87,315	42,800	15,330
Inyo	49,925	5,200	.....
Kern	107,788	72,190	15,600
Lassen	15,400	9,000	.....
Los Angeles	219,204	5,500	.....
Mariposa	80,011	27,588	9,452
Mono	396,298	35,940	8,934
Nevada	1,945,408	105,336	92,049
Placer	1,159,079	46,648	152,875
Plumas	432,294	90,055	67,300
Sacramento	121,900	51,550	58,650
San Bernardino	47,037	3,060	.....
San Diego	395,517	72,953	.....
Shasta	574,832	35,288	28,500
Sierra	888,464	165,400	73,900
Siskiyou	1,018,331	317,490	315,768
Trinity	1,446,603	135,505	225,600
Tulare	24,356	11,600	3,000
Tuolumne	1,092,540	856,806	8,752
Yuba	44,217	5,200	15,000
Totals	$12,571,900	$2,054,303	$1,282,503

So, over a quarter of the State's gold product comes from the small mines, and the small Chinese miners get enough of our money to support many families of men now idle.

CHARLES G. YALE.

* The figures presented by Mr. Yale at the State Miners' Convention, reported in last week's issue of this paper, have been revised and are here presented in their correct form.

Slickens.

THERE is a letter at this office for C. B. Dugan.

EX HUME has resigned his position as foreman of the Texas Consolidated mine at Old Diggings, Shasta county.

THE West Harmony, Harmony, Mountaineer and Providence mines paid out $25,000 at Nevada City, last Saturday.

THE new 100-stamp mill of the Phœnix Mining Company, on Cave creek, near Phœnix, Arizona, will be completed by November 15th.

THE Alaska-Treadwell Gold Mining Company of Douglas Island, Alaska, will pay a quarterly dividend of 37½ cents per share, or $75,000, on October 28th.

AN indication of reviving good times in Idaho is found in the announcement that the working force in the Red Elephant mines, near Hailey, has been doubled.

THE newly incorporated French Gulch Mining Company, in this city, is to operate the American mine, formerly the Wheeler mine, French Gulch, Shasta county.

THE pay-rolls of the Comstock for September were $62,924. This is $13,887 less than for August, and shows the effect of discharged labor. The amount paid out is the smallest in thirty years.

T. H. OXNAM, well known in California, who has been in charge of the De Lamar Company's mines in Idaho, has been transferred to the Harqua Hala mines, Arizona, in the same capacity.

THE Spanish mine, in Nevada county, recently bought by Colgate of New York, is not the Spanish mine, in Washington township, which holds the belt for profitable production of low-grade ore.

THE September report of the Potosi mine shows 1124 tons of ore worked, yielding $19,809. The assay value of the ore was $22.35, out of which $17.62 per ton was obtained. This is equal to nearly 79 per cent.

THE Calaveras *Chronicle*, published at Mokelumne Hill, has entered upon its 43d volume. It is the oldest weekly paper in California. Still it is looking active and healthy, and hasn't a gray hair in its head. May it live long and prosper.

THERE has been filed in the recorder's office of Placer county, at the request of John Spaulding, a mortgage for the sum of $1,500,000 executed for the South Yuba Water Company in favor of the Farmers' Loan and Trust Company of New York.

THE Exchequer Mining Company has re-elected the old directors and officers, with Charles Hirshfeld as president, A. K. P. Harmon vice-president, Charles E. Elliot secretary and A. C. Hamilton superintendent. The company has $591.33 in its treasury.

F. A. HUNTINGTON, of this city, has bonded for $32,000 for three months the Silver Cave and Sacra mines and Silver Cave millsite near Dos Cabezos in Cochise, county, Arizona. Hugh McCrum and John Sronfe of San Francisco and L. C. Hughes, Governor of Arizona, are the owners.

ANOTHER dividend of ten cents per share has been declared by the W. Y. O. D. Mining Company, at Grass Valley. The dividend makes the seventeenth declared by the company. The mine looks splendidly and the stockholders may look for regular dividends from present indications.

W. F. C. HASSON, a well-known electrical engineer, has been selected by the Amador Electric Light and Power Company to supervise the purchase and inauguration of the plant which is to be placed in Sutter Creek in a short time for the purpose of furnishing light in Jackson, Sutter and Amador.

THE Grass Valley *Union* recently stated that the well-known Allison Ranch mine had been sold by A. E. Davis to Prof. James D. Hague for $60,000. The statement is, however, denied authoritatively. The mine has been idle 17 years, after being a wonderfully rich producer. It employed about 250 men at one time.

THE W. Y. O. D. mine at Grass Valley has elected the following Board of Directors: Louis B. Parrot, J. R. K. Nuttall, Jacob Weissbein, Joseph Weissbein and P. F. Simonds. J. R. K. Nuttall is president; Joseph Weissbein vice-president; Jacob Weissbein, secretary; Weissbein Brothers & Co., treasurer. The mine is in a prosperous condition.

O. G. HYMAN, Thomas Cole, William Bowers, G. W. Grayson and R. R. Grayson have been elected directors of the Nevada Queen Mining Company. R. R. Grayson was chosen secretary. A cash balance of $482 was reported. Of the 100,000 shares in which the capital is divided, 34,470 shares are not out, and of these 28,355 shares were represented at the meeting.

E. M. ROOT is president of the Atlantic Dynamite Company, vice Albert Dibblee, resigned. Several weeks ago Mr. Dibblee resigned as president of the Giant Powder Company Consolidated, and Mr. Root was elected to the place. Mr. Dibblee was president of these companies for many years and he retires on account of old age and illness. He has gone East.

E. B. THOMAS, superintendent of the Spring Hill mine, Nevada county, has disappeared with money which was paid him by the company to pay off the wages of the miners. Thomas represented a Sacramento mining company, the officers of which assert that the property taken was probably about $900 and a bag of amalgam. The workmen will lose nothing.

THE Mayflower Gravel Mining Company, at its recent annual meeting, elected the following: F. Chappellet, president; F. H. Green, vice-president; directors—Charles Mayne, F. W. Zeile and H. Bendel. D. M. Kent was re-elected secretary and his financial statement showed a credit of $20,196. During the year the company produced $188,000 and paid out $56,000 in dividends. A bullion shipment valued at $2200 has just been received from the mine.

CRIPPLE CREEK, Colo., is soon to have railroad connection, and there is much rejoicing thereat. The camp now is experiencing quite a boom. Several notable sales have recently occurred. The figures and mines are given as follows: The Hart group of four claims at Cripple Creek was sold for $40,000. The Ida May and John A. Logan claims on Bull mountain were bought by Kissel, Otis & Connor of Colorado Springs for $30,000. W. E. Neberry took a bond and three months' lease on the American Eagle claim for $42,000 and 20 per cent of the output. The Little May, Lawrence and Australia were sold to Count Pourtalles of Colorado Springs for $40,000. Senator Dorsey also bought the Providence mine for $30,000, and W. E. Guyette the Camilla for $15,000. Recently the El Dorado group of 12 gold mines at Breckinridge in Summit county sold for $80,000. Two years ago they brought $30,000.

SUPERINTENDENT LEGGETT and Foreman Roy of the Standard Consolidated mine at Bodie found eight sacks of ore in an abandoned crosscut on the 400-foot level of the mine the other day. How long the ore had been there is not known, though it is probable some one hid it years ago with the intention of stealing it from the mine when favorable opportunity presented itself. The ore is very rich, and some of it is said to be the richest found in the camp. The value of the find is variously estimated from $7000 to $10,000.

THE best route to Johannesburg, South Africa, is overland to New York, then to Southampton, thence to Capetown, and from there to Johannesburg. The lowest steerage fare via the Canadian Pacific to New York and the trip to Cape Town is $123. From Cape Town to Johannesburg by rail the cost is $25 second class, $40 first class. Steerage fare to Cape Town, going to New York via the Central Pacific, is $140. The cheapest one could make the entire trip for would be $153, which represents cost of transportation only. But, judging from reports of dull times at Johannesburg, the cheapest way to go is to stay at home.

AN exchange gives the following: Prospectors, when out of reach of assayers to test their ore, can by the following method determine whether the rock to be tested carries mineral or not: When you desire to make the test, pulverize the rock very fine; then take one part of the pulp and two parts of common gunpowder; mix them together with enough water to make a stiff dough; work it up and mix thoroughly together in your hands; then form it into a cone or pyramid and let it dry in the sun or near a fire. When dry, set the cone on a flat stone and put a live coal on top of the cone. When it has sizzed and spluttered itself out, the mineral, if there was any in the rock, will be found in the shape of a button on the stone.

WHAT is said to be the biggest lump of coal ever handled is in the Washington State building at the World's Fair. It is of gigantic proportions, being 26 feet in length, 5 feet 8 inches in width and 5 feet 4 inches in height. It weighs 50,280 pounds—about 25 tons—is semi-bituminous in character, and was dug from a slope 1700 feet in length, with a dip of 18 degrees, of the Roslyn mines of Washington. This lump is 22,250 pounds heavier than the lump from the New Abram mine of Lancashire, England, and 26,850 pounds heavier than the lump from the Hocking Valley mine of Congo, Ohio. Washington has a coal area of 1,000,000 acres, and it is therefore fitting that the largest piece of coal should come from its mines.

CHARLES MARION TYLER, mining engineer, has made to the Midwinter Fair people a proposition that attracts favorable notice. Mr. Tyler's idea is to have a pyramid of standard silver, say three feet square at the base, twenty-one feet high and one foot square at the top, put up in bars or sections, as most desired, or as most convenient. Such a pyramid would weigh about 29½ tons, and would be of a value exceeding 1,000,000 of our standard silver dollars. Such an exhibit would certainly command much interest. Many people have heard and talked of a million of money, but very few have seen it, and here would be a million that would attract attention from every one. The rest of Mr. Tyler's scheme is that there should be close by a smaller pyramid of standard gold. This structure would be say 16 inches square at the base, 50 inches high, and four inches square at the top, and would weigh about 3685 pounds. The value of such a pyramid of gold would also be about $1,000,000, and might be built up of fives, tens and twenty-dollar gold pieces of American gold. Now, who will furnish the gold and silver?

Foundry Notes.

INVITATIONS to the launching of the battle-ship Oregon have been issued by the Union Iron Works. The war vessel will slide into the waters of the bay on Thursday, October 26th, at 11:46 A. M. A neat engraving of the new man-of-war is at the top of the cards, and underneath appears this lettering: "Christened by Miss Daisy Ainsworth, representing the State of Oregon, and Miss Ruth Dolph, representing the navy; launched by Miss Eugenia Shelby, representing the city of Portland."

THE Union Iron Works will furnish an engine for a large part of the power to operate dynamos and other machinery in the Mechanical Arts building at the Midwinter Fair. This engine is part of the contribution of the Union Iron Works to the Exposition. It is a 600-horse power engine fitted as a condensing engine, and will be placed on a concrete foundation eight feet in depth at least, or deeper if the character of the ground requires. The diameter of the H. P. cylinder is 22½; diameter of L. P. cylinder, 39; stroke, 24. The number of revolutions to the minute is 160; boiler pressure, 130; diameter of steam pipe, 6; diameter of exhaust pipe, 14; H. P. condensing, 600; H. P. with 100 pounds boiler pressure, 520; total weight of engine complete, 75,000 pounds.

MR. GEORGE E. WOODBURY, of the Woodbury concentrator, has just returned to this city from a trip to the World's Fair. He had a highly enjoyable trip, and shares the popular enthusiasm over the magnitude of the great exposition. "I was not particularly anxious to go to Chicago," said Mr. Woodbury to a representative of the MINING AND SCIENTIFIC PRESS. "I had attended the Philadelphia Centennial and I thought I saw and learned enough there to last a lifetime; but the Chicago fair is immensely larger and finer than the Philadelphia—but you know all about that. The exhibit of mines and mining machinery is particularly creditable. It is immense, and attracts all the attention it deserves. There are vast quantities of minerals from all parts of the globe. All the mining States make excellent showings, and foreign countries are largely represented. In mining machinery California certainly holds her own, and compares favorably with any other State or country. The Woodbury concentrator, as you know, was awarded both a large bronze medal and a diploma—the highest form of award offered by the exhibition. The points on which the award was made were efficiency of work and excellence of construction. In connection with the Woodbury concentrator were shown a Huntington ore-feeder and a 3½-foot Huntington mill."

Chinese in California Mines.

[Written for the MINING AND SCIENTIFIC PRESS by Hon. R. H. Campbell, State Senator for Siskiyou, Trinity, Shasta, Modoc and Lassen counties.]

The statistics read before the Miners' Convention by Mr. Charles G. Yale giving the amount of gold produced from small mines and Chinese mines in the different mining counties were somewhat surprising as well as interesting. They showed that the small mines in this State produced in 1892 $2,054,303, and Chinese mines alone $1,232,503. It was surprising, no doubt, to many to know that so much gold was being taken out by Chinese in some of the counties—in Siskiyou, for instance, where the amount known to be taken out by Chinese reaches the enormous sum of $315,263 per annum, to say nothing of the unknown amount taken out by these untiring and never-ceasing gold-getters. It is, in my opinion, safe to place the unknown quantity of gold taken out by them at 20 per cent of the known amount, which would swell the annual output of gold by Chinese to $378,315 in Siskiyou county alone.

Admitting this to be the case in all the mining counties where Chinese mine, and adding 20 per cent to the known product, we have the sum of $1,479,003 in gold taken out by Chinese in this State annually.

This is not as it should be, and shows how our State is being filched of its precious metal by these Asiatics. As soon as one gets possession of a few hundred dollars or a thousand or two, he packs himself off to China with it and never a dollar of it returns; but, as soon as one leaves with his little pile, another takes his place, and so it has been going on for years and years. No country on earth could stand such a drain upon it unless it was teeming with wealth. But we, with all our great resources, are beginning to feel it, and the time is near at hand when all this gold that has been extracted from our gold mines, and packed off to China during the last 40 years, will be greatly missed by our rising generation.

The hold the Chinese have upon our mines in this State does not speak well for our mining men, especially the laboring miner who uses the pick and shovel, for, in almost every instance where Chinese mine, little or no capital is needed—simply organized labor. This is where the Chinese excel. Ten, twenty or forty Chinese will join in a company, open up a claim, and work harmoniously together, while there are few instances where two or more white men, especially Americans, can work together and agree. Even one working alone will occasionally disagree with his work and repair to the nearest watering-place or resort (saloon) and enjoy the hospitality of the transient public and candidates that happen along making their campaign. He becomes so fascinated with this life that, when the summer is gone, he concludes to stay all winter. So he becomes a regular dead beat and anti-Chinese howler, while the Chinamen do all the mining and rake in all the gold-dust.

Of course there are exceptions, but, as a rule, you may go where you will among our mining camps throughout the State and you will find plenty of this kind who do no work, but do plenty of growling, while they invariably owe the store-keeper and the boarding-house. The Chinaman owes nothing.

I am opposed to Chinese coming here or staying here, but cannot help but mention the fact that many of our white miners might do well to pattern after the Chinese in some things.

Nowhere in the State is mining carried on more extensively and successfully than in Siskiyou, and among the Chinese in Siskiyou are found some of the best river, placer and drift miners in the State. The cause for their concentrating in this county is from the fact that Siskiyou offers a wide field for the Chinese favorite kind of mining, viz., river and placer. The Klamath river alone affords a continuous stretch of over 150 miles in length, to say nothing of the Scott, the Salmon and the numerous tributaries, the whole of which has been given over to the Chinese. The Chinese operate some of the most extensive drift mines in the county. They form large companies and purchase large mines, paying $10,000, $20,000, $30,000 and in one instance $50,000 for a single mine, and no one will ever know how much gold is being, or has been, taken out by these people.

I will cite one case that came under my own observation which will give some idea of how they work. The Wong Sing Co. owned a mine adjoining my own. There were 20 shares in the company, but in nearly every case two or three Chinese owned one share, making perhaps 50 owners in the mine. The mine paid well. Being a near neighbor, I frequently visited them and knew nearly every Chinaman personally. But, after a few years, my visits became less frequent, and before I knew it, all were strangers to me. Finally, it became necessary for me to purchase their mine or have trouble with them on account of dumpage, and, in treating with them, I discovered that not a single one of the old, original lot was there. All were new and strange to me.

I began making inquiries about this one and that one whom I had known to be partners in the mine a few years previous. The answers were invariably, "He go China; him cousin buy him share." How many Chinamen and how much gold that one mine sent back to China, the good Lord only knows.

The Chinese own and operate nearly all the river mines in Siskiyou and a large portion of the gravel drift mines and quite a number of the hydraulic mines, and, as a rule, are the best miners, practically speaking, that we have.

R. H. CAMPBELL.

Rule's Proposition Accepted.

The stockholders of Consolidated California & Virginia held their annual meeting last Monday and heard the reports of officers for the year. There were 25,613 tons of ore extracted during the year, which were milled by the Comstock Mill and Mining Company, yielding in bullion $524,196.74, or $20.46 per ton of ore. Of this amount $288,663.27 was in gold and the balance in silver.

The old Board of Directors was re-elected as follows: Charles H. Fish, George R. Wells, W. S. Lyle, C. O'Connor and N. T. Messer. A. W. Havens was reappointed secretary, D. B. Lyman superintendent and the Nevada Bank treasurer.

The annual financial report showed receipts for the year amounting to $632,199.74, of which $108,000 was from an assessment and the balance from bullion. The balance on hand now amounts to $61,656.34.

An interesting feature of the meeting was the proposition of James H. Rule to open up a paying body of ore above the 1100-foot level, whose whereabouts are said to be known only to him. A resolution was passed, placing the direction of operations in the hands of Mr. Rule.

The directors can provide men, mining implements and material necessary for the extraction of this ore at an expense not exceeding $4000 per month for not more than six months, Rule to receive ten per cent of the net proceeds of the bullion product until the amount paid him aggregates $10,000. It is the first time in the history of this mine, which made the gigantic fortunes of the old bonanza firm, that any outsider has been permitted to direct operations. It appears that the confidence of the stockholders is based partly on sentiment, for Rule has always been lucky, and has uncovered several valuable mineral deposits in various mines.

The stockholders of the mine need to have faith in Rule, and a good deal of it, if they expect ore to be found which shall convert the mine into a dividend-payer. If the mine produced during the year $20 ore, and still it was necessary to cover a deficit of $108,000 by assessment, it would be very interesting to know just how high a grade of ore must be found before the assessments cease, and Irish dividends are no more. In California, $3 ore can be made to pay.

Ore Deposits of the United States.

A new work has been received at this office from the presses of the Scientific Publishing Company, New York, on "Ore Deposits of the United States," by J. F. Kemp, Professor of Geology in the School of Mines, Columbia College. Since the publication of "The Metallic Wealth of the United States," by J. D. Whitney, in 1854, no complete review of the ore deposits of the country has appeared, and a revolution has taken place in many of the theories of ore deposition, consequently Prof. Kemp's work is now not only the only book giving full and latest information relating to the ore deposits of this country, but it is also the only work giving modern ideas on this important subject. Prof. Kemp's treatment of his subject is consistently geological and the principles of origin have been made as prominent as possible. The literature is cited in its completeness, but the references have been annotated as to whether they are specially recommended for general consultation, for their historical record, or for complete investigation. In the division of space, the more important regions have been naturally given the greater amount, and the effort has been made to preserve thus a proportion, and not to be too much influenced by purely scientific considerations. At the same time, it is believed that no district of any importance has been overlooked, and that, if it is given but passing mention, the references will place the full literature at command. It is fully realized that there are many important districts, especially in the West, of which our recorded knowledge is limited, and which need study and description. It is hoped that the book may emphasize these, and encourage the study of them. The materials for the book have been assembled for lectures and instruction in economic geology, which have been given by the author during the last seven years, five at Cornell University and two at the School of Mines, Columbia College. The price is $4.

What Was the Output?

Replying to a recent article in this paper, giving $10,000,000 per annum as the common estimate of the output of the idle hydraulic mines, the Marysville *Democrat* complains that "not one of the story-tellers has ever produced facts to prove his assertions." The *Democrat* immediately makes this vague statement: "The MINING AND SCIENTIFIC PRESS is reminded that the anti-debris people raise more grain, fruit, wool and other products in one year than will overbalance in value the output of all of the hydraulic mines in any two years of their existence." But it advances no fact to prove its assertion, which is unfounded and untrue. The product of the hydraulic mines has been a subject of much controversy, and it is difficult, not to say impossible, to show exactly what it was. But we do know that in the years preceding the Sawyer decision, the California output of gold was larger by many million dollars than at present; and we do know that the falling off in the product has been almost wholly due to the cessation of hydraulicking. According to the engineers, the value of lands involved in controversy with the hydraulic miners was about $3,000,000. Their products per annum were scarcely as much.

In the article which the *Democrat* criticises, we stated that "the anti-debris people have apparently not been able to raise enough additional grain, fruit, wool, hops, hides or vegetables to compensate for the loss. All their interests affected by the debris fight are not half as valuable as one year's output of these idle mines." The first statement can scarcely be disputed; and the second has been shown to be sufficiently exact. In conclusion, the *Democrat* denounces hydraulic mining as a "nuisance," a "detriment," and a "curse." These are harsh terms, quite in keeping with the past attitude of the anti-debris agitators. But abuse is not argument, nor will it prevail against the general sentiment in favor of the hydraulic miner. He has been "flat on his back" for some years, as President Neff puts it, but the public is now willing that he shall arise. Legislation designed to assist him has been enacted, and doubtless further aid will be given. But the *Democrat* can take comfort in the reflection that all adverse interests will be protected, including newspapers with two-horse power boilers and ten-horse power whistles.

The Flour-Gold Problem.

Still another process for saving flour gold has been invented by Dr. C. B. Brierly, of Boise, Idaho. As described by local papers, it consists of a sluice-box of ordinary size, into which are set in grooves copper amalgamated screens. The screens, any number of which may be placed in the sluice, are arranged in sets of three, each set being a foot or thereabout apart. The center screen of each set is placed in a vertical position and the other two are arranged at opposite angles of about 45 degrees each. These screens are placed in a slanting position in order to present a greater surface to the water. In the first set of screens the meshes are about 20 in number to the square inch. The meshes are finer in each succeeding screen until in the last there are 40 to the square inch.

The dirt is first put through a grizzly or a series of grizzlies and the finer particles with the gold pass into the sluice-box and through the first set of screens. Here some of the gold is caught in the meshes of the amalgamated copper wire. As it goes on, passing through the finer and still finer screens, all the gold is saved. In order to make a cleanup the screens are removed and the amalgam brushed off, the same as in the case of amalgamated plates.

The inventor has tested the machine on Snake river, and fire assays are said to have failed to bring to light any traces of gold in the tailings.

THE very great activity of the Nevada City (Cal.) mining district, compared with a year since, is shown by the following statement by the *Transcript* of the number of mines now in operation:

Spanish,	Odin,
Nevada City,	Manzanita,
Champion,	Lyons,
Providence,	Bellafonntains,
Mountaineer,	Yosemite,
Wyoming,	California,
Reward,	Gold Tunnel,
Home,	Green Mountain,
Santa Rosa,	Ellison,
Alpins,	Knickerbocker,
Mayflower,	Yellow Diamond,
Pittsburg,	Stiles,
Gold Flat,	Coan,
North Banner,	Ebangh,
Federal Loan,	Hussey,
Harmony,	Baldwin,
West Harmony,	And several others.

One year ago the total was less than ten.

Studies in Gold-Milling.

NUMBER IV.

[Written for the MINING AND SCIENTIFIC PRESS by J. A. Edman.]

An examination of the concentration products of gold mills, as obtained under the modern methods now generally applied, reveals much of interest, both to the millman and mineralogist, and particularly when the microscope is brought into use. Among the concentrates of a well-managed quartz mill, the miner can find and study all the heavy minerals within his lode, of which many may have escaped his observation during years of mining and old mill practice, and many of which are gold-bearing. As among the ores, we here find that the decomposed ores furnish concentrates containing the greatest variety of minerals. Here, while the sulphides are less prominent, gold-bearing oxides in all forms abound, and a great variety of crystalline, heavy silicates, titanates, etc., present beautiful and interesting forms for the mineralogist although generally barren of gold.

In concentrates from hard ores, pyrite forms the prevailing mineral, with a variety of other sulphides, arsenides and antimonides, as well as tellurides and selenides, of which many are present in very minute forms and often microscopic. Among these, the most perfect are derived from ores where the valuable mineral is interspersed throughout the mass; where it is massive, the concentrates generally show irregular grains with the crystal form scarcely perceptible.

As an illustration of the size of grains may be quoted the percentages obtained from samples of concentrates from two large wet-crushing mills, running on pyritous ores and using screens equivalent to 35 mesh. These averaged 55 per cent passing a 100-mesh screen, 20 per cent passing 200 mesh, and nearly 10 per cent of grains 1·400 inch and less in diameter. These are not exceptional cases, although in general larger-size grains predominate. Gold is but sparingly visible in the quartz sands of such concentrates, but floured mercury is present, mostly in very minute forms, as the larger globules are collected in the distributors of most belt machines.

As concentration is to great extent dependent upon the densities of the minerals treated, a list of the principal gold-bearing minerals is subjoined, giving specific gravities, beginning with the highest, mostly taken from Dana's System of Mineralogy:

		Spec. gravities.
Tellurides and Selenides	Calaverite	9.0
	Selenide of gold and silver	8.0 to 8.5
	Hessite	8.3 — 8.4
	Sylvanite	7.9 — 8.3
	Nagyagite	6.8 — 7.2
	Galena	7.2 — 7.7
	Mispickel (arsenical pyrite)	6.0 — 6.4
	Copper glance	5.5 — 5.8
	Bornite	4.4 — 5.5
	Hematite	5.3
	Pyrite	4.8 — 5.2
	Marcasite	4.6 — 4.8
	Goethite	4.0 — 4.4
	Chalcopyrite (copper pyrite)	4.1 — 4.3
	Zinc blende	3.9 — 4.2
	Limonite	3.6 — 4.0

The following table shows the densities of rocks generally forming the gangues of gold-bearing lodes:

	Spec. gravities.
Quartz	2.6
Talc	2.7
Talc schist	2.6 — 2.8
Calcite and limestone	2.5 — 2.8
Clay slate	2.5 — 2.8
Chlorite	2.8
Dolomite	2.9
Hornblende rock	3.0 — 3.1

For comparison will be given the specific gravities (calculated) of various percentages of gold with quartz, the gold being taken at 18 and the quartz at sp. gr. 2.6:

	Value per ton.	Sp. gr.
½ per cent gold in quartz	$ 2,000	2.67
1 " " " "	4,000	2.75
2 " " " "	8,000	2.91
3 " " " "	12,000	3.06
4 " " " "	16,000	3.21
5 " " " "	20,000	3.37
Gold and its alloys as found in ores and in placer deposits		14 to 19

From the above tables it appears that the densities of the ordinary gangues vary from 2.5 to 3.1, while the gold-bearing minerals exhibit specific gravities from 9 to 3.6, limonite being the lowest in the scale. As limonite often is an alteration product of iron pyrite, we find in all decomposed gold ores every gradation between the bright pyrite of 5.2 specific gravity to the dull and earthy limonite of 3.6 in density, the change generally progressing from the surface of the pyrite crystal. As the original gold contents of the pyrite generally remain intact, the gold in the limonite, whether massive or pseudomorph after pyrite, is often of great value without materially increasing the specific gravity, as can be seen by a comparison of the relative densities of gold-bearing quartz.

As the facility and success of concentration generally is in proportion to the difference in specific gravities between the prevailing gangue and the gold-bearing mineral, it follows that bright pyrites and other heavy sulphides may easily be separated from a quartzose and even a talcose or hornblendic veinstone, but when the attempt is made to concentrate oxidized pyrites, the difficulty increases with the oxidation of the sulphide, and when below a density of 4, becomes nearly impracticable on belt concentrators. As very rich limonites are found of specific gravities 3.8 and less, the result is a loss of much of the gold-bearing material, which passes off with the tailings. With talcose, chloritic or hornblende gangues, scarcely any pure limonite can be concentrated.

The success of concentration on any particular lot of ore can generally be estimated by careful panning, and any millman, skillful with the pan and the batea, can realize for himself what degree of difficulty he may meet in concentrating oxidized pyrite or limonite. The oxidation products of other sulphides occasion less loss, as they, when not in powdery form, generally are of a higher specific gravity than the iron oxides. A loss often occurs in concentrating, due to the floating of broken pyrite, resulting in the conchoidal or cup-shaped fracture of that mineral, for which reason the breaking of the crystals should be avoided as much as possible.

An examination of typical samples of concentrates from prominent gold mills of California points to the necessity of sizing before concentration, without which no perfection can be attained. Concentrates from one mill will vary in size of grain from 1·30 inch to 1·600 inch, while frequently 60 per cent will pass an 80-mesh sieve. This can be considered a full commentary on battery crushing of highly pyritous ores. The practice yet extensively prevailing in California of milling such ores without previous sorting or treatment is open to many objections, principally from the difficulty in handling the concentrates economically. Many instances can be cited of ores carrying over five per cent of sulphides, subjected to the routine of battery crushing, concentration and chlorination. Often a large portion of such ores could be sorted to a grade of 25 to 50 per cent sulphides, and be treated either by roasting and smelting, or by roasting in bulk and subsequent grinding, or by crushing and chlorination after roasting.

In practice, concentration of gold ores appears suited only to hard or but slightly altered veinstones, carrying a moderate percentage of sulphides or other heavy non-oxidized minerals. For decomposed and highly oxidized gold ores, a different treatment is imperatively demanded, or many of the best gold mines in the United States will remain dormant.

The at present generally approved and prevailing system in the larger gold mills of the United States may be stated as consisting of the following operations:

1. Breaking the ore by jaw crushers, or by the very efficient rotary crushers of the Gates pattern.

2. Crushing in stamp mills with varying weights of stamps, size and shape of mortars and apertures in screens.

3. Amalgamation in battery and on plates, stationary or percussive.

4. Concentration on belt concentrators, generally without previous sizing.

5. Roasting of concentartes in reverberatory or revolving furnaces.

6. Chlorination of the roast by the Plattner process or in barrels.

7. Leaching and precipitation of gold and silver from solution in various ways.

This system, while undoubtedly very effective on many hard ores with a moderate percentage of well-diffused sulphides, yet has some defects inherent in the method.

1. Gold, being generally well diffused in the gangue, is not set free from the quartz by the stamping.

2. The sulphides, being friable, are to great extent slimed and become unsuitable for successful concentration.

3. Amalgamation in battery, being altogether accidental and foreign to the original intent of the stamp action (namely, a moderately fine crushing), cannot be regulated or perfected by any known appliances, as is evidenced by the entire want of uniformity in weights of stamps, height and rapidity of drops, sizes of mortars, depth of discharge and sizes of screen apertures, and also by the constant variation in the condition of amalgam obtained in battery. Amalgamation on plates, except in few instances, is unsatisfactory and difficult of control, from reasons already stated when referring to amalgamation products.

4. Concentration becomes difficult with grains of all sizes, and fails entirely in arresting the rich sands of low specific gravity, necessitating subsequent treatment of the tailings.

Under the above system the paradox becomes evident of the extreme care used in saving concentrates, which for California may be averaged as carrying $100 per ton, while the rich sands, worth $2000 per ton and more, are permitted to escape without hindrance.

Various other milling processes have been brought forward of late years, to overcome some of the above-noted defects, and prominent among them may be mentioned the chlorination process mainly consisting in crushing by rolls, drying, sizing by revolving screens, roasting the whole of the uniformly sized product in revolving furnaces, and chlorinating in barrels. This is undoubtedly for many ores as near perfection as can be desired, but cannot be applied to low-grade ores, the cost of milling being at least $3 to $4 per ton.

In another direction a notable advance has been made by the continuous-grinding process introduced by M. P. Boss, and generally applied to silver ores, but being in some respects, and with some modifications, eminently fitted for gold ores. Here crushing is done by stamps, and comparatively coarse screens are used. The pulp in a continuous stream flows into grinding pans, thence into amalgamating pans, and finally to settlers. This is mainly a grinding and amalgamating process, the slimes not being treated, but may be concentrated, if so required. The expense of this plant will preclude its general adoption.

A thorough crushing and grinding, combined with amalgamation, has been achieved by the designer of the Bryan mill, now coming into favor on the Pacific coast, and used both on gold and silver ores. In action this mill partakes of the qualities of both arrastre and Chili mill, and consists of heavy iron rollers revolving in a circular path with moderate speed. Here the crushing is good, the contact of gold and mercury prolonged enough to give efficient amalgamation, and the flow of the pulp gentle. The great weight of metal appears to be the chief objection to this mill if used in a large plant, but it is certainly a step in the right direction toward perfect reduction.

It must be admitted that for simplicity, cheapness and effectiveness on many free-milling ores, the stamp battery as constructed in the United States, and especially in California, yet occupies the foremost place among successful machinery as a crusher; an effective device exclusively for amalgamation of the pulp, used in connection therewith, would be a great desideratum, and can be achieved when inventors and millmen will work in that direction, instead of multiplying concentrating devices, of which already enough exist to meet all practical demands.

But a thorough remedy for the losses yet occurring in gold-milling should be sought in perfecting methods of grinding, to reduce our gold ores to such sizes as will set free most of the metallic gold, and in combining this improvement with an amalgamation based upon true physical and chemical principles. From ancient times gold-miners have used a machine which meets many of these requirements, and the genius of modern invention, if applied to its improvement, would, in the writer's opinion, bring us nearer to a perfect milling system than any other known line of mechanical reduction. The old-time arrastre, the gold-miner's constant and reliable friend, furnishes the germ for elaborating a rational system of gold-milling. The success of the Bryan mill and the Boss system of rolling is due to an adoption of the principles evolved from modern arrastre practice in its best forms. In discussing the capabilities of this method, it will be pertinent to inquire into the condition and physical aspects of gold ores and their products by mechanical reduction.

The Tuolumne County Fair.

TO THE EDITOR:—The mineral exhibit at the annual fair, Twenty-ninth District Association, attracted a great deal of close attention during four days—October 4th, 5th, 6th and 7th. It was pleasing to note the extreme surprise of those who pressed round the railings that enclosed the display of minerals, gold-bearing rocks, and the beautiful rich specimens of the precious metal, glistening in the rays of the electric lights. The now famous Rawhide mine exhibited one block of quartz, literally covered through and through with gold and tellurium, of about 200 pounds weight: also other richer samples could be seen in the glass cases. This rich find was only discovered the past week. It was taken from the 400-foot level of No. 2 shaft in the drift running southeast, being eight feet wide. The general rock will mill into the hundreds per ton. It is without doubt the old rich shoot that was found in the early days in No. 1 shaft, or south shaft. No. 2 shaft is known as the "Jack Rabbit." Through the kindness of W. A. Neviles, the superintendent, this display was loaned to the fair directors for exhibition. Yet far richer pieces can be seen at the mine, one block of 400 pounds being held together almost entirely by the gold itself. The mine is veritably a honanza.

Tuolumne county is in reality a mining county. The famous mother lode of California runs through it on the west, and the upper belt of rich lodes is found east of Sonora. About equidistant from both belts millions have been extracted, and doubtless millions remain awaiting the miner and capitalist to explore and invest. Geologically and mineralogically speaking, this county possesses the formation for the prolific production of gold. The past results prove this assertion. If an obelisk (a gilded one, if

you please) was constructed, giving the cubical area of all gold fonnd since 1850, it would astonish the most sanguine. Mule-loads of gold were taken out of this county close to and surrounding Sonora in the early days; also from the environs of Columbia and Shaws Flat, and the various gulches and creeks contributed their millions—all placer or pocket deposits. Where did all this gold come from if not from the erosion of our auriferous quartz veins, which time and the elements have denuded? Yet almost to the present day, with hut few exceptions, we have no deep explorations. For instance: the Eureka Consolidated at Summersville is the deepest, heing over 1200 feet and still sinking; the old Confidence, on the underlay—being a flat lode—800 feet; the App, nearly vertical, mother lode, 800 feet, who are taking ont very rich ore to-day; the old Souleshy mine, 800 feet, from which millions have been extracted; the old Patterson, 750 feet; and the Sonora Bonanza, 900 feet on the underlay, which produced immensely rich ore. One piece of quartz of the latter yielded $40,000. From three of the above-named mines millions have been taken out. I could mention a score or more of other mines in the county that have yielded hundreds of thousands in gold coin. But, with all this showing, Tuolumne in late years has been greatly neglected, hut I am happy to state that her mines are now, at last, receiving the attention they merit and she must soon take her place in the front rank of gold producers.

The cause that has militated against this county is apparent and two-fold. Firstly, our mineral lands have been wrongly absorbed by the rancher, and in this respect the Land Office, in a measure, is much to blame, because its requirements are too lax in not compelling the rancher to prove it is non-mineral, instead of being asked to swear that the land in question is more valuable for agricultural than mineral purposes. Some of our best auriferous lands have been thus lost to the miner. Secondly, those who own mines have stood much in their own light, asking ridiculous prices in many cases for undeveloped properties, or holes in the ground, more properly speaking, when they have hut a very small prospect and on no defined lode. Yey they may prove valuable, if opened up. Many capitalists would he glad to invest if given a reasonable chance to develop on a working bond. Wildcat and pig-in-the poke claims cannot, or should not, demand cash till they are able to show a distinct value, but should give the privilege to develop, under certain restrictions, to those who seek to invest. If this plan were more frequently adopted in this county our population would soon double itself. But I fear you will think that my preface is rather long, so will *revenons à nos moutons.*

The following is a list of some of the most conspicuous exhibits and the names of the contributing mines:

Rawhile mine—Rich and beautiful specimens of milling ore.
Santa Maria—Owner, John Neale; situated on the Yosemite road; rock is rich in free gold; sulphurets[value, $2000 per ton—ten per cent. Mr. Neale has heen 17 years struggling to open his mine, has at last reached the goal of his hopes aod his expectations are realized.
Carmelita—io same section as above; rich ore.
App—Mother lode; rich rock.
Eureka Consolidated—Good rock.
Fairview—Sulphurets, high grade.
Noonday—Rose creek; rich rock.
Monitor—Sugar Pine; rich ore.
Buena Vista—Near Santa Maria; rich rock.
Silver Queen—Yankee Hill; good rock.
Rising Sun, or Sonora Extension—Arrastreville; maoy samples, rich in free gold, and high-grade sulphurets.
Crystalline—Mother lode; rich ore.
New Albany—Upper belt; good rock.
Keltz—Many samples rich ore.
Ruby—Rich rock.
Comstock Raoch—Rich rock.
Easton—Rich samples.
Sonorita—Near Rising Sun; good rock.
Golden Gate—Sonora; very handsome specimen of sulphuretted rock, very rich.
Buchanan—Good rock.
Mina Verda—Columbia; good rock.
Conlin & Graham—Sawmill Flat; rich rock.
Belcher—Groveland; good rock.
Gem—Mother lode; rich samples.
Gerymanda—Good rock.
Joe Major's Raoch—Good rock.
Souleshy—Rich ore.
Joe Hooker—Rich samples of ore.
Crown Point—Spring gulch; many samples rich io free gold.
And many others which space will not permit to notice.

In the glass cases, carefully guarded, were rich gold specimens, including samples of gold-hearing placer cement, inclosing heavy, water-worn gold, from Table mountain. The quartz specimens, some of great beauty, are valuable for the gold they contain, as well as their fantastic forms, but the choicest are still in the Chicago Exposition. I think the gem in the collection helonged to Louis Page, heing a pinnacle of crystalline gold four inches in height and interspersed with crystals of tellurium of the variety petzite. Mounted on a velvet hase and rising or rearing itself under a glass hemispherical dome it was very much admired. It was found in his mine at Brown's Flat.

The following gentlemen exhibited very handsome collections of gold specimens of great intrinsic value: Messrs. M. B. Harriman, D. Oliver, E. Kiel, F. Conrad, Louis Page, Henry Munroe and C. Fitch.

Columbia Marble Exhibit.—The exhibit from the above works was small in quantity. By a good display they could have added greatly to the effect of the mineral collection. Had they sent, as last year, an obelisk of their various particolored marbles the general effect would have been greatly enhanced. What should have been one of Tuolnmne's most interesting exhibits was thus hardly represented. We trust at the next fair, in 1894, the marble works will take the hint, which is given in kindly spirit, to furnish a center shaft or colnmn of composite construction, showing their heantiful and varied kinds of marble, worthy to represent their handicraft, as well as the beauty of a natural and valuable product of this county.

Lastly, Mr. John Neale exhibited a very fine collection of jewelry in gold of his own manufacture, the gold being obtained from the mines of the county. Mr. Neale also exhibited a pretty collection of quartz crystals, nice souvenirs of Tuolumne, mounted in gold, having a beautiful and simple effect, in the shape of pins and brooches in the latest styles. His collection obtained first premium. We also noticed rare crystals of silica, chalcedony, silicified woods, and a specimen of rubellite or red tourmaline. ARGUS.

Tuolumne county, October 7, 1893.

Origin of the California Stamp.

[Writteo for the MINING AND SCIENTIFIC PRESS by Mr. C. P. Staoford, 2401 Buchanan Street, San Francisco.]

I find in your valuable journal of August 26th a paper read at a recent mining meeting in Cornwall by Capt. Josiah Thomas, manager of the Dolcoath mine, descriptive of the California stamps recently introduced by him into the county. After the paper was finished the question was asked by Mr. E. G. Heard whether Capt. Josiah Thomas could tell him where the stamps were invented and why they were called California stamps. Not harring Captain Josiah's facetious answer, I am able to give the following reply to Mr. E. G. Heard's question:

In the winter of 1850–51 a company was formed in Placerville, El Dorado county, California, for the purpose of exploring for gold-hearing quartz. The region chosen for exploration was from Mathenas creek west on both sides of the north fork of the Cosumnes river, and as far west as Shingle Springs. Much hard and unsuccessful work was done and continued until ahout the 8th or 10th of April, 1851, when it was decided to settle up our company affairs and disband. But before separating, and as we were sitting about our camp-fire, some one proposed that we explore a certain difficult region that had been neglected. The proposition was agreed to. It was also agreed that we go in pairs, taking three different but (roughly) parallel routes, returning to camp by the trails at night, and sharing the results (if any) equally.

A discovery was made. The last two men to get into camp brought word that they had fonnd large outcroppings showing gold everywhere. They had found what was afterward known as the Union quartz mine, and later as the Church-Union, and is now owned by Senator Perkins and others. The discovery was made on the 12th day of April, 1851.

To make sure of our title we moved immediately and made our camp on the ground claimed. After cutting away the brush and building a wagon road down to Mathenas creek, ahont half a mile distant, we rested, and hegan to discuss what we should do with our discovery. It was decided presently that the only thing we conld do was to huild a quartz-mill and work onr mine.

In the meantime the Tennessee Quartz Mining Company below us, on the Cosumnes river, having heard of onr discovery, sent us word that they had a steam engine, and iron shaped and punched for a hoiler, together with the machinery and irons for a complete five-stamp mill—a duplicate of one they had erected and were running. If we wanted a mill they would sell us the duplicate. We had often seen theirs in operation, and immediately decided that one like it would answer onr purpose.

Now, leaving out here a long, long story, I will only say that the mill was bought and set agoing, and paid for. None of the present generation can ever know what that meant in the spring and summer of 1851 here in California. This was not, however, the "California stamp-mill," hut was the mill out of which that was developed. Let us take a look at it.

We see no California improvements yet. It was just such a mill as had been made in Tennessee and other Southern States previous to the discovery of gold in California. The hed for the mortar block and the battery frame consisted of layers of timbers crossing at right angles, tamped with sand and flooded with water. On this was placed the frame of the battery, and between the posts was fitted the mortar block, not standing on end and deep in the ground as now, hut lying on its side as did all the timhers under it. It is easy to see now how springy and unsuitable such an arrangement was.

On the block was placed a low mortar, and the sides were huilt up of plank and carefully secured with rods and holts and screws. But, alas! what a leaky affair. In the mortar stood five stamps, each consisting of a head eighteen inches long by six inches square, *without any shoe*, and a timher ten feet long by seven inches square. Through this timber was a slot wide enough to let the cam play freely through it. The upper end of this slot, when the stamp stood on the die, was ahont on a level with the upper side of the cam-shaft and was the point at which the cam took hold of the stamp to lift it up and drop it, the stamp being kept in place by suitahle guides, top and bottom. The cams were much straighter than the tangent cam now used.

There it stood. It looked to our inexperienced eyes all right. Indeed, we felt a little proud of it; thought we had a better mill than the Tennessee company. But on starting it we soon found the weak point.

Two of the stamps had become much shorter than the others. On opening the mortar, we found the two stamps had parted from the head. Of course the dove-tail tenon was destroyed and the lower end of the timber badly bruised. The stamps were all taken down and the fastenings to the iron head more carefully fitted.

After heing replaced and having run several hours, we found that the heads were of the softest iron and had assumed the shape of a sled-runner, next to the feed opening. The battery was left standing, and a man was dispatched to Sacramento with sketches for a hoss provided with a shoe. This shoe had a tenon which fitted a corresponding jaw in the lower end of the head. The shoe was held in place by a key driven through jaw and tenon, the keyholes being arranged so as to have a "draw-bore" effect.

We ran that battery till some time in the winter of 1851–52, hut (without specifying further) everything about the stamps and mortar proved unreliahle. Every forenoon was spent in repairing, the hattery calling for the main part.

Not far from us another mill was built soon after ours, but was never run much, as the ore did not pay. One day I went over there. I found it boarded up close and apparently deserted. However, I turned trespasser and, loosening a board, went in. I found the stamps like ours, except that the lower end of the stem was square-tapered and dropped into a correspondingly square socket in the top of the boss. At the lower end of the boss was another square socket, which corresponded to a square-tapered horn on the shoe. This horn was provided with fillets at the corners of each of the four faces, bringing the bearings close to the corners of the socket. This, however, had proved a bad arrangement, for a numher of the corners of the sockets were broken out by the force of the two fillets on each corner of the horn. The remedy for this difficulty was easily indicated. Make the horn and socket round. This led presently to the idea of making *all* the parts to the stamp round instead of all square, and make the stem of iron. At this point came into view a fairly clear vision of the stamp as we see it now in a California stamp-mill. But as yet it was only a vision.

I told my brother (president of our company) what I was thinking of, and directed the carpenter to make a model of a stamp as above described. The stem was about three feet long by one inch in diameter, the hoss being two and a half by six inches long. The shoe was two and a half by two and a half inches, and all held together hy the tapered horn and stem forced slightly into the tapered sockets in the boss. This was the first concrete form of the California stamp.

Armed with this model, my brother and I decided to approach certain of the company and propose the building of a hattery on this line. This was received with some favor, but the company as a whole would only consent to putting in one stamp in the middle of the old battery for the purpose of trying it; at the same time enjoining me to make it as cheaply as possihle.

Well, this was something. So I left the next morning for Sacramento. No iron was there such as I wanted, which was a piece of shafting ten feet long by three inches in diameter. I went on to San Francisco. No iron was in all the town of that size, but Messrs. Egery & Hinckley had two pieces, 12 feet by 2¾ inches, one of which was sent np to Sacramento to the Sacramento foundry. Here, in due time, a stamp was fitted up and sent to the mill and put in place of the middle wooden stamp. On starting, it won its way easily. It came down with such evident efficiency that

it was not long before the company decided to have a new battery. This was in the autumn of 1851.

Incidentally, while down at San Francisco for iron for this one stamp, I had learned from Mr. Egery (of Messrs. Egery & Hinckley) that they had afloat a small lot of 2¾-inch shafting that would be due early in the following February. So all we could do was to wait for that iron.

I came down about the 6th of February, 1852, and found the iron had come. As we could use the old battery as it stood, all we needed was the five new stamps and their fittings. These I remember Mr. Egery sent us with very gratifying promptness. It was not long before we had our new stamps running.

But in this first battery the stamps did not revolve. They were held from turning by a short arm from the top of each stem, standing out at right angles to the cam-shaft. The outer end of these arms played in suitable slots.

We had an engineer and machinist in our employ, who took great interest in our new stamps. His name was Isaac Fisk, a man full of resources in his line. He suggested the idea of modifying the tappet so as to present a full face clear round the stem, and, removing the arms and slots, let the stamps revolve at will. But our old-fashioned cams were not curved enough, nor was the curve drawn on the right principle. A simple investigation showed that the corner of the cam would rake across the corner of the tappet during a part of the lift; and it was thought that both would be ruined directly. But Fisk contended that it would work, so we tried it on one stamp, and found that the constant turning of the stamp so distributed the lubricant (pitch-pine tar) that there was practically no cutting. This was the first revolving stamp. We presently fitted the other four in the same way.

We found we had made a great improvement and our mill was soon attracting much attention. Revolving iron stamps were soon in use in various directions, and from that day to this only slight modifications have been made in them.

At this point I might close this paper, as, strictly speaking, Mr. E. G. Heard's question has been answered. The battery, however, as a whole has been greatly improved. I will give a list of the principal improvements:

1. *The Automatic Ore Feeder*—I applied for and received letters patent for an automatic feeder in 1858. My principal claim was for a lever regulated by a set-screw as and for the purpose described. This claim held for 21 years, the patents having been renewed in 1872, as provided by law at the date of that patent. This lever proved to be indespensable and is used on all ore-feeders in general use. Mr. Thomas A. Cochran, of Tuolumne county, was the most successful improver of the original device.

2. *The Gib Tappet.*—The late Mr. Zenas Wheeler, in 1862, then a mill manager at Gold Hill, Nev., improved the original tappet of 1852, calling the modification "the gib tappet." This was further improved by Messrs. Prescott, Scott & Co. (now the Union Iron Works) by casting the tappet with the gib in place and then boring all out together.

3. *The Latches and Billet of Wood.*—I had what answered to the latches, but the billet of wood placed between the faces of the tappet and cam as a ready and simple way of placing the stamps on the latches out of reach of the cams I did not discover. I would like to know the genius who first did that.

4. *The Mortar Block.*—This, as now made, is *set on end* and deep in the ground. Originally the mortar stood on timbers laid flatwise.

5. *The Mortar.*—A high mortar instead of a low one with sides built of wood.

6. *Tangent Cams.*—A good improvement.

The origin of the four last is unknown to the writer. Besides these there are some minor devices that a battery man would not be ready to spare, the origin of which cannot be traced.

I have made some effort to discover the origin of those shoes with square-tapered horns which I found in the deserted mill. I know the men who built the mill and also the firm that furnished the machinery and castings. But they have all passed away except Mr. E. T. Steen, of this city. He remembers the mill very well but does not remember any details. C. P. STANFORD.

THE somewhat enthusiastic statement is made by Colorado papers that "within two years the Cripple Creek district will produce more than one-third of all the gold mined in the United States. It will produce this year over $2,500,000, and work has scarcely begun yet. Next year, without railroads, it will produce at least $6,000,000. In 1895, with railroads, it is said to be a conservative estimate to say the output will reach $10,000,000." It is easy to multiply figures. While there is much activity at Cripple Creek just now, it is not a sure thing that it will continue to grow for several years to come. Booms sometimes hurst. We do not mean to infer that Cripple Creek is not a paying gold region, for it is; but it is not as big, rich or as certain as California, which is the only State in the Union that produces more than $10,000,000 in gold per annum, and we think it will continue to be for some time; and, further, that its actual gold production will increase more rapidly than any other State.

The Mineral Lands.

TO THE EDITOR:—No event in the history of the world, so insignificant in itself, ever created such a degree of excitement, was so productive of great and far-reaching results, and started people on the trot from all portions of the habitable globe, as the finding of a small piece of gold in California. Occurring at a time when a spirit of speculation and adventure was rife, great impetus was given to the boom. It was gold that everybody sought. It was scattered far and wide all over the country, and wherever found it was on mineral land. The pioneers, or "sooners," can well remember the long trains of big teams that lined the roads from Stockton, Sacramento and Marysville, all loaded with mining implements and supplies of Chili flour and beans destined to the mines, to be exchanged for the gold that the workers on the mineral lands were digging out.

Later on, the little two-horse teams were seen, loaded with garden truck, the owners gee-hawing their way to the mines for gold. In time this "infant industry"—the cultivation of a patch of a few acres—grew to giant proportions of agriculture, which in turn required machinery and flouring mills to prepare the product for use. Thus one branch of industry is developed to supply the requirements of others. Everything seems to have been developed on the fly. The old stage-coach and ox team were too slow to keep pace with the spirit of the age. The great railroad system was developed to meet the requirements. Everything and everybody seem to have got to going so fast that they jumped the straight and narrow track and got on to the broad and crooked road, lost sight of their starting point and now don't know just where they are at. The vast grain fields and products of the soil have driven Chili flour and beans from the land. The outside world is now the market instead of the mines. The palace car has sidetracked the old stage-coach and mud wagon. Steam and the freight car have turned the ox teams out to grass. These great changes, and the prosperity and success consequent, seem to have induced a false idea of independence, and with some developed a spirit of antagonism against (as it were) the author of their existence.

Amid all the changes, one thing remains unchanged: the allurement, the desire for gold. The rancher, the merchant, the manufacturer, and those in other lines of business, may think they are independent of the mines, and that they can get the twenty-dollar pieces from the East and from Europe. A close observer of events sees the old miners packing their sacks of gold-dust and gold bars to the mints. The twenty-dollar pieces go and come, and wherever found in any part of the world no one doubts but they are the product of the mineral lands.

The gold and silver mines may be compared to the motive power—the main driving wheel that sets in motion and keeps in operation the great machinery of finance, commerce, manufactures, and all other kinds of business and trades. Where the prosperity and progress of everything is so dependent on the mines, a wise and liberal policy in regard to the mineral lands is obvious.

Two periods are recognized with reference to the methods and regulations observed in regard to the mines. The first period embraces the time from the discovery to about 1870, when Congress commenced experimenting at long range with the mining laws. The second period extends from that time to the present. But few of the early miners, or "sooners," who controlled the policy of the first period knew anything about mining or mineral lands. The history of events shows that they were observing, practical workers, and soon acquired a knowledge of conditions and adopted regulations to suit. They made and executed their own laws relating to possession and working the mines. The laws were liberal and just. There was no conflict. From the surface indications and surroundings they formed pretty correct ideas in regard to the formation and character of the deposits, and, from a brief, successful experience in California, adventurous prospectors started out to explore and prospect other portions of the world. The result was the discovery of the gold mines in Australia, British Columbia, Africa and Alaska. In all parts of the world where gold and silver mines are being extensively and successfully worked, California miners are prominent in their management and working.

The great success and progress of mining in California during the first period was due, in a great measure, to the wise, liberal and just policy that controlled. It is the observing, practical mine-worker who knows just what the miners need, just what policy is best calculated to encourage the discovery and development of the mineral resources of the country, and just what should be designated as mineral land. The second period was inaugurated by an Act of Congress, passed in the interest and through the influence of a monopoly, to get title from the Government to a large tract of mining ground, thereby shutting out individual prospectors—the discoverers of all the mines. The law starts out on broad and correct lines, and if it stopped and got off at the right place it would be all right.

All will agree that it is a wise and liberal provision wherein the declaration is made that "All valuable mineral lands belonging to the United States are declared to be free and open to occupation and exploration * * * by citizens of the United States." But a wide difference of opinion and interests would spring up if a proposition is made to repeal that portion of the law giving the right to purchase the mineral land. So far as I know, no Government relinquishes its right to and control of its mineral lands except the United States. We might adopt the internal policy of other Governments in some things without any sacrifice of principles and but a small degree of independence.

The question of greatest importance to settle first is, What should be designated as mineral land? This should have been definitely and permanently settled by the Government long ago on a sensible and just basis.

There should be but two classes of lands recognized in the mining States and Territories. What is not clearly established to be agricultural land capable of cultivation should be considered mineral. On a rough estimate, leaving out the larger valleys and deserts, four-fifths of the land west of the Rocky mountains is mineral land. If any traces of valuable mineral are found on land unfit for cultivation, it should be considered mineral land, and its value as such can be determined only by prospecting and development.

The decisions and rulings of this second period are inconsistent and absurd in requiring proof of a rich-paying mine on the land to establish its mineral character. On this false assumption, carry the theory back 50 years and there would be no mineral land in the richest mining country in the world. Looking forward 50 years, what wise judge or learned secretary can tell where the rich mines of the country will be?

In regard to the control of the mineral lands, there should be an unconditional reservation of the mineral in all the lands in the mining States and Territories that are not clearly agricultural. The policy of disposing of the mineral lands has brought about a condition of things that would be difficult to remedy now. A great portion of the mineral lands have been given to railroad companies. It is true there is a reservation of the mineral in the grant, but it is nullified by decisions of the courts. Large tracts of mineral land are sold to lumber companies without any reservation. Trusts and combinations are formed to get possession and patent to large tracts of the mineral lands. The dominant idea of exclusive ownership of all that is in sight seems to prevail. The whole system, if it can be called a system, in regard to the control of the mines and mineral lands needs to be reconstructed. A move in the right direction will be to establish a department of mining, with competent mining men who have a thorough knowledge of the true conditions and requirements of the mining industry to control. The mining laws should be revised by competent miners. The mining districts should be enlarged to suit the conditions and convenience, with a Government surveyor to each district, whose duty would be to keep a record of locations and mines in his district and map the same and make a report at stated times to the head of the Department of Mining.

The Government should never relinquish its right to the control of the mineral lands by making grants or issuing patents for mining claims. I am aware that this proposition would arouse bitter opposition with a *class of large miners*, but would be endorsed by a *large class* of small ones.

It may be contended that capital would not invest the large amount of money required to develop and work the large mines without obtaining a patent to the land. An Act of Congress would make claimants just as secure in their holdings as a patent, so long as they complied with the conditions.

There are large tracts of mineral land patented, where the claimants neither work nor prospect them, or permit others to do so.

A liberal policy should be pursued to induce and encourage the discovery of new mines. But the much-needed gold should not be locked up in the mineral lands by a patent. J. F. TALBOTT.

IT has been discovered that the holes often observed to appear in marble which has remained for a period in sea water are caused by an insect.

Mechanical Progress.

Things to Remember about Shafting.

Don't buy light hangers and think that they will do well enough, when your own judgment tells you that they will spring.

Remember that shafting is turned one-sixteenth inch smaller than the normal size.

Cold-rolled and hot-rolled shafting can be obtained the full size.

The sizes of shafting vary by qnarter inches up to 3½ inches.

For line shafts never use any that are smaller than 1 11-16 inches in diameter, as the smallest diameters are not strong enough to withstand the strain of the belts without springing.

The economical speed of shafting for machine-shops has been found to be from 125 to 150 revolutions per minute, and for woodworking shops from 200 to 300 revolutions.

A jack-shaft is a shaft that is used to receive tbe entire power direct from the engine or other motor, which it delivers to the various main shafts.

Keep the shaftings well lined up at all times, and tbis will ward off a break-down and avoid a waste of power.

Know that the pulleys are well balanced before they are put in position, as a pulley much out of balance is quite a sure method to throw shafting out of line.

Look to the pulleys, and see that they have been bored to the size of the sbaft, for unless this is done, the pulley may be out of center on the shaft and prevent smootb running.

If possible, apply the power to a line of shafting at or near the center of its length, as this will enable you to use the lightest possible weight of shafting.

Hangers with adjustable boxes will be found to be the most convenient for keeping the shafting in line.

Keep your drip-cups cleaned, and do not allow them to overflow or get loose.

Have a supply of tallow in the boxes; in case of accidental heating, it will melt and prevent cutting. This rule, while good for general use, applies particularly to special cases where there is a supposed liability to heating.

Never lay tools or other things on belts that are standing still, for they may be forgotten and cause a break-down when the machinery is started.

Don't attempt to run a sbaft in a box that is too large or ton small, as you will waste time and fail to secure good results.

A loose collar held by a set screw will cause the collar to stand askew, and it will cut and wear the box against which it runs.

In erecting a line of shafting, the largest sections should be placed at the point where the power is applied. The diameter can then be gradually decreased toward the extremities remote from this point.

Don't put loose bolts in plate couplings, as this will give no end of trouble in cutting, shearing and tbe wearing away of the bolt boles.

Don't think that because your shafting has been well erected, and you oil it regularly, that it will never need any inspection or repairs.

Don't try to economize in first cost by having long distances between hangers, for a well-supported shaft will always do the best work; short shafts are the surest to be straight and to remaio so.

The length usually adapted to shafting bearings is two to four times the diameter of the shaft, varying with the diameters of shaft, kind of bearings and the material used in them. Large shafts in the gun metal or bronze boxes may have beariogs only twice their diameter in length. Cast-iron bearings up to and including three-inch shafts are often made four diameters of the shaft in length, particularly for self-adjusting hangers.

If babbit is used for the boxes, use only a good metal; do not adopt the common mixture of tin, antimony and lead.

Insist upon having good iron in your sbafting, as tbe bearings will take a finer polish, and you will not be subject to sudden ruptures.

If the strain on a pulley is so great that the set screws already in will not hold it, do not let them score in the shaft, but put in an extra screw, or cut a key-way and put in a key.

The width of a key-way should be one-quarter of an inch for eacb inch of diameter of the shaft.

The depth of the key-way is one-half its width. —American Engineer.

New Small Arm for the Navy.

A Washington dispatcb says: The adoption by the army of a new magazine rifle, to displace the rifles with which it has been armed for years, is to be followed by the selection of a new arm for the navy.

The Small Arms Board, which for weeks has been discussing the caliber of gun best adapted for naval purposes, has concluded that the army 30-caliber is not the gun for the navy, and has recommended a rifle of the remarkably small caliber of six millimeters, or of about 23½ caliber. The report of the board was approved by the Chief of Ordnance and forwarded to the Secretary. He has just approved it. The Ordnance Bureau will now begin the manufacture of rifle barrels of this caliber, and will call upon inventors of the country to submit their inventions of breecb mechanism and stocks to suit this caliber.

The adoption by the army of an arm of foreign invention will not control the navy, if it be possible to secure a rifle of domestic invention and having every feature of value which the mechanism of the army gun possesses. The board, in determining upon the caliber, was influenced by the greater value to the service of a gun with smaller caliber than that of the army, rather than by the advantages of having the rifles of identical size, with a view to the use of interchangeable ammunition. This advantage was not overlooked, but it was decided that the occasions for the use of interchangeable ammunition were so rare as not to warrant sacrificing wbat the board thought was a superior type of gun.

The board finds that the smaller caliber rifle has many advantages over the Krag-Jorgensen gun of the army, which is of 30 caliber. These are: Flatter trajectory, which will do away with sights; greater velocity and necessarily greater range; lighter ammunition and greater accuracy. Some barrels for test at the ordnance shops here are now being manufactured of this caliber. The bureau will also experiment with a barrel manufactured of steel, with 25 per cent of nickel.

Under the plans of the department the navy will furnish the barrels and ammunition, and the inventor who shows the best breech mechanism will supply the stock and all other parts.

Fully 5000 rifles are necessary to supply the enlisted force of the navy.

Knife Edges for Balances.

Most people would imagine that a knife edge working on a plane would give all the accuracy needed for pendulums and balances; but students are aware that there is still friction. In a German technical serial Herr Hasemann has referred to this subject, and offers a suggestion which may prove of value to makers of very delicate instruments. Herr Hasemann proposes to rest the knife edge upon another, or, rather, to give both the knife edge and its support a semi-cylindrical form. In that case the junction of the two surfaces is a plane, and for the same angle of the swing displacement of the surface of contact is much smaller. In the experiments undertaken to test this arrangement, the difficulty anticipated with regard to stability was found to be very much less than one might he led to think.

A Great Bridge.

A proposal is afoot for bnilding an immense hridge over the Mersey to connect Liverpool with Birkenbead. According to descriptions in the Liverpool newspapers, the bridge will be of the arched suspension type, in three spans, the roadway being suspended from an arch instead of the usual chain. Each span will have a clear waterway of 1100 feet, tbe center span having a clear beadway of 150 feet above high water of ordinary spring tides. The designs of the structure have already been completed.

Scientific Progress.

Proposed Sixty-three Mile Light.

A remarkable instance of scientific development in the matter of reachiog lights has been brought to the attention of the Uoited States Lighthouse Board at the Treasury Department by the reception from France of a pamphlet describing a new light to be erected on a lighthouse off the coast of Britanny. The lighthouse will be built on Penmarch Point, and will be known as the Eckmukl Lighthouse. It will contain an electric light of 40,000,000-candle power, casting a beam which can be seen at a distance in clear weather of 63 miles, and in foggy weather a distance of 21 miles. The highest order of lighting in the United States lighthouse service can only be seen 21 miles in clear weather. The light on the Eckmukl Lighthouse is of the "lightning-flash" order. At the usual height of ordinary lighthouse towers its ligbt cannot actually be cast more than 25 miles before it strikes the horizon, but beyond that point it is reflected in the sky for 28 miles. This light is most powerful, searching and penetrating, and is erected at a cost of about $60,000.

Device to Prevent Collisions.

To prevent collisions between railway traios, a Frenchman, Prof. Pellat, has invented a machine by means of which every locomotive on the road registers its position electrically every so often on a scroll of paper at the central office. The scroll is kept slowly moving over a cylinder. Electric contacts are made between points above and below it, which decompose some iodide of potassium in the paper and thus cause a blue stain. This happens every time an engine passes over certain levers arranged beside the truck at intervals of a mile, more or less. By watching the scroll a train dispatcher can see in an instant wbere every train is, and if any two of them approach too closely be can stop any engine at the next post telegraphically. An electric signal may be picked up by the locomotive with a "brush" on one of the wheels when it touches tbe registering fixture.

To Ascertain Loss of Head.

A "computer" bas been invented by the editor of the *Compass*, which enables the loss of bead of any pipe from 1 to 100 inches, and from 100 to 10,000 feet long, with any velocity of from 1 to 15 feet per second, to be read at once. The instrument, which consists of a dial and a revolving disk, will also, it is said, guide the discharge in cnbic feet per second for any velocity and diameter of pipes.

Practical Use for the Krytophane.

The remarkable instrument invented a few years ago and known as the "krytophane," is said by a French journal to have been recently perfected to such a degree that it is now regarded as promising successful practical results. In the construction of this peculiar apparatus a very sensitive receiving diaphragm is so disposed that it will respond to and transmit air vibrations produced by any noise to a distant telephone, the attention of the attendant being attracted by an alarm bell provided at the receiving station.

Scientific Facts.

Clonds are on an average about 500 yards in thickness.

The largest apes bave only 16 ounces of brain; the lowest men have 39.

All the glaciers in the Alps would not equal one of the largest in our Territory of Alaska.

The amount of air that a man will inhale in 24 hours will fill 78 hogsheads and weigh 53 pounds.

A scientist who has investigated the matter states that the men who are employed in the Paris sewers are as healtby as the average person, and no other 800 men in that city are so free from zymotic diseases.

The bluebottle fly discharges a not unimportant duty as a natural scavenger. Its larvæ of maggots must devour large quantities of putrefying and decaying matter, and must, therefore, remove from the earth's surface much material offensive, if not disease-producing, in its tendencies.

Dr. Ernest Hart of the British Medical Journal declares that cholera will become extinct in the next 30 years, because of the rapid advance of sanitary science.

Napbthaline, which is a product of coal tar distillation, in appearance something like parffin, has been found useful in England for the preservation of timber. The wood is soaked for two to twelve hours in the melted naphthaline at a temperature of obout 200° F.

Differences in Thermometers.

It is pointed out as a curious fact by M. Renou in his "History of the Thermometer" that the English employ the system of Fahrenheit, a Dane; the French that of Celsius, a Swede; the Germans that of Reaumur. To complete this paradox, it is observed by a contemporary that the Fahrenheit system was defined by Hanow, that of Celsius, perhaps, by Christin, and, finally, that originally the Reaumur thermometers marked a point in the neighborhood of 100 degrees, and sometimes higher, for the temperature of boiling water. In fact, Fahrenheit graduated his thermometers by making 0 degree at the lowest temperature of winter and 24 degrees on exposing the instrument to the sun. His degrees were divided into four parts at a later period.

Early Chinese Civilization.

After making full allowance for the Chinese natural talent for exaggeration, Dr. Brewer, of Cambridge, allows them to have been acquainted with the properties of the magnetic needle B. C. 1715; while the early French Jesuit priests, who had no interest in supporting mythical stories in the land of their adoption, believe trade routes and canals to have been in existence about the same period; that a system of regular marriages had been introduced among the people; that weaving was understood; banks, bank notes and gunpowder were in existence; a regular calender was reformed B. C. 1498; a knowledge of lunar eclipses evinced and the people divided into classes, distinguished from each other by different colored dresses.

Delicate Rain Gauge.

Professor Marvin, of the United States Weather Bureau, at Washington, has invented a rain gauge so delicate that it will measure the one-thousandth part of an inch of moisture. It is self-registering, moreover. Chief Harrington has distributed several of these instruments among observers in various parts of the country.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is lberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cash, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

BOOKS ON ASSAYING.

BY C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth: 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt: Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

GAS WORK A SPECIALTY.

Electricity.

Electric Development Since 1876.

How rapid the development of the electrical arts has been within the past few years may be seen by comparing the electrical exhibits at the Centennial Exhibition in Philadelphia in 1876 with those at the Columbian Exposition, now at Chicago, says Prof. A. E. Dolbear in the *Cosmopolitan*. Then electrical apparatus consisted mostly of telegraphic devices, galvanic batteries, static machines, Leyden jars, etc., for school illustrations and measuring instrnments, such as galvanometers and resistance coils. There were a few crude dynamos and one small imported gramme machine, none of them intended to maintain more than one arc light. Now there ls a rivalry for space in which to exhibit dynamos capable of lighting 60 or more in one circuit. Then there was not a single incandescent lamp in the world. Now they are to be seen by the tens of thousands and with all degrees of brightness, from that of a tallow dip to those bnt little inferior to the arc itself, and every exhibit is thus lighted. Then there was not a single electrical motor that was more than a toy to be run by a galvanic cell. Now motors for all kinds of service, from driving a fan to those running printing presses, looms, machine shops and threatening the existence of the locomotive itself.

Then all welding was done by hammering at the forge. Now electrlcity heats the ends to be joined, and, in less time than it takes to describe the process, heavy shafts and rails may be welded even better than was possible before. Then it was not possible to weld steel or other metals than iron. Now almost any metal can be electrically welded to another as easily as iron to iron. Then there were induction coils for producing sparks a few inches long. Now such sparks have been made five feet long, and it is believed could be made 50 feet long if it were worth the while. Then induction coils were employed for changing low potentials to higher. Now the transformer reverses the process and makes electric lighting feasible miles away from the dynamo. Then it was possible to send but two telegraphic messages in opposite directions simultaneously. Now 72 messages can be sent, 36 in each direction, on one wire wlthout interference. Then the telephone was first exhitited on a line the length of a building. Now one can talk with another a thousand miles away.

Then it was believed that a continuous condnctor was essential for doing any kind of electrical work. Now it is shown that all kinds of such work may be done without material connections. Then it was thought that llght was one of the physical forces. Now it is believed that light is an electromagnetic wave. Then it was believed and taught that electricity could never be economically employed for driving machinery, and that its light could not be subdivided. Now it is believed that electricity is in its infancy. Then all the electrical exhibit could be put in a space 50 feet square. Now a huge building, covering acres, is found insufficient for the needs of exhibitors. All this since 1876.

A Frolic of Lightning.

A singular freak of lightning is reported in the vineyard of Mount St. Mary's College, near Emmitsburg, Md. The lightning first struck a tree and killed it; the apples hanging on the tree withered. It then passed to the roots of the tree and tore up the ground as if it had been plowed for a distance of about 20 feet. It then struck the end post of a grape arbor, knocking a large piece of the post that supported the vines a distance of 40 feet. It then ran along the lower wire that supports the vines, about 200 feet, to the opposite end of the grape arbor, where it pulled out the staple which was attached to the post, knocking a piece out of that post also. On the way, the grapes that hung near the wire were injured, so that they withered on the stem. The grapes that hung higher up were less damaged. The same effect, in a less degree, was produced on two adjacent arbors running parallel to the one just mentioned, one on each side of it, at a distance of about 30 feet.

An Electric Fire Engine.

F. H. Wheelock, engineer of the Franklin school, of St. Paul, Minn., has exhibited to the St. Paul Board of Fire Commissioners an electric fire engine, and he offers to the city the free use of a system which he has invented, which involves the substitution of electricity as the motive power for all steam fire engines, and a large reduction in the cost of operating the department. Mr. Wheelock, in describing his electric engine, said one of its chief merits is its light weight and high power as compared with the steam engines at present in use. The steamers weigh from 9000 to 9900 pounds and are 18-horse power, while the electric engine weighs but 4500 pounds and is 100-horse power, which could easily be doubled if needed. The heavy boiler and machinery is done away with, and one man and one horse would be dispensed with for each engine, and the city would not have to purchase 400 tons of hard coal for the department, as at present.

To use the electric fire engines, the city would have to put in an electric plant consisting of two 300-horse power dynamos, one of which would be held in reserve in case of accidents. A wire to carry the current with connections to each hydrant wonld have to be laid. When the first cost of this had been paid, and Mr. Wheelock says it would be inconsiderable, the expense of maintaining the fire department would be very materially reduced.

Increasing Towing Power.

On some of the French waterconrses a system of chain haulage has been adopted to assist steam tugs in towing barges up the river against the stream. Briefly, the chain, which is fastened at each end, lies at the bottom of the river. It passes between guides at the stern or bow of the tug, over rollers and guides, and round nearly the whole of the circumference of the haulage pulley or drum, which ls driven by gearing from the engines. Leaving this pulley the chain passes over a similar series of rollers between breaking pulleys, and then is permitted to fall again into the river. With a vlew to increase the speed of the tug, a system of magnetic adhesion has been devised by M. Bovet, and has recently been tested on the Seine. It consists essentially in combining in the haulage pulley a magnet, the upper sides of the groove forming powerful pole pieces, which are short circuited when the chain engages in the groove. By this means the pull on the chain and therefore the speed of the boat are increased. One of the towing companies on the Seine is said to have adopted this system.—Exchange.

Electric Mining Plant.

An extensive electric mining plant is being laid down for the Compagnie des Mines de Noeux, of the Pas-de-Calais. The generating plant comprises two dynamos, and current will be transmitted a distance of two and three-quarters miles for the operation of five lifts, ranging ln power from 6-horse to 15-horse power. Five pumps will be driven by electric motors, and a tramway 1.24 mlles long will be worked electrically, each train consisting of 25 wagons. In addition to these applications, arc and incandescent lamps will be used for lighting purposes.

PRACTICAL TREATISE ON HYDRAULIC MINING.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Useful Information.

Mineral Statistical Column.

At one end of the main alsle of the Mining Building at the World's Fair stands a column of minerals that furnishes the public with a comparison of the bulk of the minerals produced in this country in each second of time. It was designed and erected by Dr. David T. Day, chief of the Division of Mining Statistics and Technology of the United States Geological Survey. In the following table the blocks of the column are represented by numbers, and the size of each block in cubic feet or cubic inches will be found in the column at the right. In the original column the petroleum production is represented by a heavy glass tank filled with crude petrolenm. Natural gas is shown by a block cut to proper size. The other minerals are shown in their natural state:

TABLE SHOWING COMPARATIVE AMOUNT OF EACH MINERAL PRODUCED IN THE UNITED STATES DURING EACH SECOND OF TIME.

No.	Mineral.	Length of each side of cube.	
1.	Bitumioous Coal	4.5	feet.
2.	Anthracite Coal	3.25	feet.
3.	Natural Gas	2.25	feet.
4.	Petroleum	2.1	feet.
5.	Limestooe	2.04	feet.
6.	Iroo Ore	1.5	feet.
7.	Graoite	1.25	feet.
8.	Cemeot	1.0	feet.
9.	Sali	10.5	inches.
10.	Sandstooe	8.75	inches.

54.	Rutile	.0576	graios.
55.	Platinum	.009	graios.

Cure for Snake Bites.

E. F. De Celis of Mexico writes the following to the *Scientific American:* From time to time I see in the papers recipes for curing the bites of polsonous snakes, recommended by medical and other people. In California, where I come from, we have occasion at times to treat animals for the bite of the deadly rattlesnake. I have seen two kinds of herbs used; one is called in Spanish "la golondrina" (the swallow), growing in the most arid plains; the other is the rattlesnake weed. Both are very effective, but it is not every one who can tell them, even when at hand. What I know from my own experience to be an infallible cure is the gall of the snake itself. One drop of it on the wound will effect a cure, even when inflammation is far advanced. I have seen a dog treated whose head had already swollen to twice its natural size, and it cured him almost instantaneously. The gall may be preserved in alcohol, or even dried, requiring in the latter case only to be moistened; even saliva alone between two stones will do. I have seen a case of this kind. If preserved in alcohol, of course, the whole bag of the gall is put into the liquid entire. If true of the rattlesnake, and, as I said before, I know it is infallible from my own experience, it is probably true of all other poisonous snakes, and might it not be true in the case of the rables that the gall of the animal would cure the bite?

When at college, in London, the teacher in French, who had been a Spahis in Algiers, assured me that the Arabs cured the sting of the scorpion by mashing the scorpion and applying it as a poultice on the wound. This I have never seeo tried, however.

Recipe for Painters.

White paint for metallic surfaces. A very common drawback to the use of white paint is that on exposure to heat, and especially to gas flames, lamp shades, cellings, etc., painted with oil colors, it soon turns brown, owing to the calcination of the organic matter contained in the colors, and the linseed oil in the oil paints, says the *Journal of Building*. A British exchange gives the following recipe to procure a durable white color: Take some fine zinc white and mix it to a suitable consistency with a solution of protoxide of sodium, and water glass of 40 to 50 degrees B. The surfaces to be painted must be thoroughly cleansed, and for certain metals, such as zinc, must be washed off with hydrochloric acid. Now cleanse the surface with water, and lay on several coats of this zinc water-glass paint until the article is deemed sufficiently covered. A pause should be made between each coat, but not of any long duration, as this paint soon dries. If a large surface, such as a ceiling, has to be covered, too much paint should not be mixed, as the chemical action of water glass on zinc white is to render it soon thick and hard. This paint is not affected by excessive heat, and always remains snowy white, only being affected by dust and soot. It never scales, and beats all other oil paints on the score of beauty, durability and whiteness. It may also be tinted to taste by the addition of other mineral colors.

New Process of Galvanizing.

Among the recent experimental processes with iron and other metals is a new process of galvanizing, which would appear to have some advantages over the older method of steeping articles in molten zinc, the claim being that by cold galvanizing a more uniform coating is obtained, and, in the case of wire, the tensile strength is not diminished, says the Chicago *Journal of Commerce*. Comparative tests of the hardness of the coating on iron sheets show that the plate thus galvanized has a somewhat harder surface than that obtained by the usual means. An equally interesting result of recent investigations is the successful coating of metal surfaces with glass, in which operation there are melted together about 125 parts, by weight, of ordinary flint glass fragments, 29 parts carbonate of sodium and 12 parts of boric acid. The fused mass is poured out upon some cold surface, as of stone or metal, and pulverized when cool; then of this mixture a powder is made with silicate of soda, water, glass—solution 60 degrees Baume—and with this coat the metal is glazed, being heated in a muffle or other furnace until it has arrived at the requisite fusion. This coating is represented as adhering firmly to steel or iron.

Lew Wallace's Royalties.

The presence of Gen. Lew Wallace in the city has revived gossip in literary circles about the royalties he received from "Ben Hur." One of those connected with the Harpers' house said recently that at the last settlement Wallace was shown to have received nearly $140,000 in royalties for that book. If that is so, it is the largest sum ever earned by a romancer, at least by an American.—Philadelphia Press.

Coast Industrial Notes.

—The Union Pacific Railroad has been placed in the hands of a receiver.

—The ferry war on the San Francisco-Oakland route has reached such a pass that the fare to Oakland by the creek route is now 2½ cents.

—The National Electric Tramway Company has authorized a loan of £70,000 for the purpose of extending and improving the service in Victoria, B. C.

—A London cable says it is now expected that the prices of furs, especially for the fur seal, bear, marten and mink, will suffer a decline unless business shows an improvement.

—Half the standing grain in the Palouse Valley, Wash., is ruined by the heavy rains, which means at the very least 3,000,000 bushels. Many farmers have turned their stock upon the fields.

—If the plans now being formulated by Henry P. Taylor, Nichaus Bros. and others, are carried out, there will soon be a line of ferry steamers plying between San Francisco and West Berkeley.

—Kern county has decided to issue $250,000 worth of general-improvement bonds. The money is to be expended on a public building in Bakersfield and on the highways leading to the county seat.

—C. H. Dodd, a dealer in agricultural implements, with headquarters at Portland, Or., has closed his houses in Colfax, Pullman and Garfield, Wash. The recent rains have killed the implement business in those sections.

—The Northern Pacific, Great Northern and Canadian Pacific have announced a $50.25 round-trip rate from western terminals to Chicago and $47.25 round-trip rate to St. Louis. Tickets will be sold until the 31st of October and will be good until November 18th.

—On Sunday, October 22d, the San Francisco and San Mateo Railroad Company will begin running cars regularly to Baden. The track-laying has been completed, the poles placed, and the stringing of the wires is now in progress and will be finished before the date mentioned.

—The Virginia and Truckee railroad shops have closed down. Nearly the whole force was laid off. The car shop, foundry and blacksmith shop were closed. Only three or four are employed in the machine shop. The shut-down is due to the inoperation of the mines on the Comstock.

—Stewart Meozies, representing a Scotch syndicate and owner of the Chow Chilla ranch, Merced county, is negotiating with the Fresno Canal and Irrigation Company for 1000 feet of water, to be delivered some 40 miles to the above ranch, for a consideration reported to be $200,000 or $300,000.

—The Baker Iron Works of Los Angeles and a San Francisco firm have taken out liens on the Bear Valley Company's canal in San Bernardino county, for which they furnished material. Ex-President Graham has headed a movement to reorganize the company, assigning mismanagement as the cause of the present trouble.

—The first piles used in the Government jetty at the mouth of San Diego harbor were driven Saturday, Oct. 14. The work of construction will be completed in a year, or perhaps less, with reasonably good fortune. After the driving of the piles is well started the work of sinking willow mattresses full of stone will proceed, reaching a width of 22 feet.

—Judge Fullerton of the Circuit Court at Corvallis, Or., has issued an order directing an unrestricted sale of the Oregon Pacific Railroad property by the sheriff on or before December 15th. The property is claimed by local papers to be worth $15,000,000, with $850,000 indebtedness. The road has been in operation about 12 years, and has had a checkered career.

—Surveyors have commenced work on an extension of the Pajaro Valley railroad from Watsonville to Corralitos, a distance of seven miles. The road will pass through some of the finest fruit and sugar-beet land in the Pajaro valley. It will be an extension of the line operated between Watsonville and Salinas, and will be managed by the Western Beet Sugar Company.

—The South American and West India Immigration and Development Company, to supply implements to the southern countries and carry on a general trading business, has incorporated with a capital stock of $50,000. The stockholders are Henry W. S. Emunds of Durham, England; and Geo. T. Goden, H. D. Kirkover Jr., R. B. Elden and George H. Benedict of San Francisco.

—Work has been commenced on the big chute for the American River Land and Improvement Company at Folsom. It will be 2900 feet long, and 1,250,000 feet of lumber will be used in its construction. The firm which is doing the work is under bonds to complete it by December 15th. The logs will be floated down the canal to Folsom, where they will go through a mill.

—In the Washington building at the World's Fair is exhibited the largest piece of wood-turning in the world. It is the work of J. L. Nygren of Tacoma. Mr. Nygren spent about three months of his time making a special lathe and turning from a single log of cedar a huge vase, six feet high and four feet across the top. The vase is highly polished, and shows to splendid advantage the color and graining of the red cedar.

—The J. C. Anthony Company has been incorporated for the purpose of selling and manufacturing drugs and medicines and establishing sanitariums for the care of the sick. The subscribed capital stock is $1,000,000, held as follows: W. E. Hale, prison warden at San Quentin, $250,000; J. C. Anthony, Vallejo, $125,000; Alex. T. Vogelsang, San Francisco, $125,000; W. H. Griswold, San Francisco, $250,000; O. I. Brown, San Francisco, $250,000.

—The firm of Huntington, Hopkins & Co. of this city, is getting its affairs in shape to retire from business. Half of its force of employes has already been discharged, the bar iron has been disposed of to George W. Gibbs & Co., and Crane & Co. have assumed charge of the plumbers' supply business, occupying a portion of the storeroom of the firm for that purpose. Miller, Sloss & Scott may take what is left, that firm having purchased the Sacramento branch of Huntington, Hopkins & Co. some months ago.

—At the recent annual meeting of the Nevada Bank of California, the usual reports were presented. From the report of President Hellman it appears that the following were the gross earnings for the year ending with the last day of last month: Interest, $317,688.38; commissions, $8283.34; exchange, $33,545.63; total, $359,517.35. Deduct—Expenses, $96,164.63; taxes, etc, $10,250; total, $106,414.43; net profits for the year, $253,102.72; paid in dividends, $180,000. The bank has assets of $8,686,585.67.

—The total shipment of products from San Jose last week was 12,433,470 pounds. An enormous amount of dried prunes were shipped East, 3,621,755 pounds being sent. Of green fruits 1,277,855 pounds went East. Garden seed also went away in large quantities to the East and Europe, the total being 181,005 pounds. The total shipments of all dried and canned fruits and other products sent East was 6,299,245 pounds. The shipments to California points were 2,134,225 pounds.

—The San Gabriel Valley Rapid Transit Railway has passed into the hands of the Southern Pacific. The road is 20 miles long, and extends from Los Angeles to Monrovia, with a branch running from Shorb to the Raymond Hotel, on the outskirts of Pasadena. The Southern Pacific has been operating the road under a verbal contract for some time. It was formerly operated by the Los Angeles Terminal Company, and is a standard-gauge steam railway running through a beautiful section of country.

—The State Supreme Court has handed down its long expected decision in the mandamus case of Louis Jacobs against the San Francisco Board of Supervisors. It declares, in substance, that the Mayor of San Francisco has no right to veto an ordinance to fix water rates which the Board of Supervisors has by a majority vote adopted. The regulation of water rates is said to be something with which that officer has nothing to do. Accordingly, the water rate order adopted last March and vetoed by Mayor Ellert is valid, and has been in force from the beginning of the fiscal year which opened July 1st.

—The mileage of the San Francisco cable roads which have entered into the Market-street combine is given as follows:

	Miles.
Market-street Cable Company	13
Same, partly constructed and other lines	19
Market-street and Fairmount	1
City Railroad Company	8
Same, partly constructed and other lines	7
Potrero and Bay View	1
Southern Heights and Visitacion	2
Same, partly constructed and other lines	4
Park and Ocean	5
Ocean Beach	4
Central Railroad Company	7
Same, partly constructed and other lines	3
Omnibus Cable Company	26
Same, partly constructed, etc	8
North Beach and Mission	15
Same, partly constructed, etc	2
Ferries and Cliff House	16
Same, partly constructed, etc	11

—The much-discussed consolidation of the principal street railways of this city has finally taken place. The capital stock of the consolidated companies will be something over $18,000,000, and of this amount the Market-street system will get 76 per cent or about $13,500,000. Of the remaining $4,500,000 the Omnibus Company will secure two-thirds and the remaining one-third will go to the Ferries and Cliff House line. Included in the corporation are the Market-street cable system, Market-street and Fairmount, Park and Ocean Railroad, Potrero and Bay View, Southern Heights and Visitation Valley, City Railway Company, Central Railway Company, Omnibus Railway Company, North Beach and Mission and Ferries and Cliff House.

—The co-operative system adopted two months ago by the Auld Shingle Company, of Ballard, and its employes, has already been abandoned, as it was not working well, and the reduction of the scale of wages by the Shingle Weavers' Union has made it possible for the company to run on the old plan. The arrangement was that the employes should aid in other work besides their own special line and for a time they did this willingly, but it was not long before some began to complain that they were doing more than their share and objected to being taken away from their regular work to help in other ways. After returns were received on the product, the bill for shingle bolts was to be paid, then the manager's and bookkeeper's salaries, and out of the balance the workmen were to be paid the union scale. If there was anything left it was to be divided pro rata among all, the managers and employes. The company was to be paid 10 cents per 1000 shingles for the use of the mill. Two mills at Blaine, one at Tenino and one at Aberdeen were run on a similar system. When the Shingle Weavers' Union reduced the scale last Saturday the company gave notice of the abandonment of the co-operative scheme and returned to the old wage system.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

STRUCK RICH QUARTZ.—Amador *Ledger*, Oct. 13: W. A. Nevills, a former resident of Jackson, who has been developing and prospecting the Rawhide mine near Sonora for some time, recently struck a rich body of quartz.

The Alma people have secured a right of way for a road along the ridge from Kennedy Flat to the Lancha Plancha and Jackson road opposite their property. This will obviate the hard pull from Jackson to their mine and admit of their getting their machinery, lumber, etc., over the ridge road the same as the Kennedy does.

The Argonaut Mining Co. has from ten to twelve men at work on the site of their mine, grading down the hill for road purposes, and building roads to the property. They have arranged to leave the main road on Kennedy Flat and wind round the hill to the site of the mine, which is just this side of the Kennedy tramway, the road running thence to the Kennedy grade. The grading and road work will probably last a week longer, at which time the shaft will be commenced. There are now several teams engaged on wood and timber contracts, and they expect to have enough on the ground by the time the rains come to run during the winter. Arrangements have been made for a donkey engine which they intend to use during the first 500 feet of sinking.

Butte.

THE COLEMAN.—Oroville *Mercury*, Oct. 13: G. W. Price of Forbestown has let a contract for the erection of a new ten-stamp mill on a quartz ledge owned by him and known as the Colorado. The ledge is within a short distance of Forbestown, and development work has shown it to be extensive and rich, the ore running high in free gold. Mr. Price is to have his mill running inside of 60 days at the most.

To supply water to this and other mines in that vicinity, the Forbestown Ditch Company is now engaged in reconstructing an old line ditch, running to the north and west of Forbestown. The expense of this repair will be about $1000, and water can be supplied to several mines now being developed.

When this mill is completed there will be 90 stamps in operation in the Forbestown district.

Lassen.

GOLD FROM A NEW FIND.—Reno *Journal*: The Reno Reduction Works recently received a small lot of ore from B. H. Leavitt of Susanville, which turned out handsomely in gold with a small per cent of silver. The ore is from a new find south of Susanville near the foot of Diamond mountain. The ledge is large and well defined.

Nevada.

LADY BUYS A MINE.—Mrs. Ida Marion of Grass Valley, who is an owner in the Mount Charles mine in this district, has purchased a half interest in the 30-acre quartz claim on Red Hill, owned heretofore by H. Trevaskis, says the *Transcript*. She paid $3000 for the interest, which is considered a moderate figure by old miners acquainted with the property. The owners propose to commence the development of the claim soon.

GOOD PROSPECT.—It is said that the Spanish mine, recently purchased by Colgate & Co. of New York, promises to be among the leading mines in the Nevada district. According to measurements of the ledge opened up, and the assays of the rock, it is estimated that it will yield $70,000 to the new owners. That is only what is now in sight, says the *Transcript*.

THE FEDERAL LOAN.—*Transcript*, Oct. 16: The Federal Loan quartz mine, in Willow Valley district, about 2½ miles from Nevada City, is looking unusually well. They are still sinking, and where they are working now they have a six-foot ledge. The rock, good and hard, is all crushed as taken out, and it averages a little over $11 per ton. If only the good ore were taken out and crushed, it would give an average of $30 per ton. The company has a lot of sulphurets, which run from $80 to $90 per ton. The ten-stamp mill is kept running night and day, Sundays included. The Federal Loan is proving to be a big property.

A STRIKE.—Nevada *Transcript*, Oct. 16: A rich strike was made in the Mount Georga mine yesterday. Specimens of the quartz were brought to town to-day and shown to many of our citizens. The rock is filled with rich sulphurets and shows considerable free gold. The Mount Georga is located on Rush creek, about three miles west of this city. It is owned by Dr. W. O. Jones, John E. Carter of Grass Valley, Fred Zeitler of this city and others. The mine has been prospected for the past year or two, the indications met with encouraging the owners to keep on with the work. Mining men regard this strike as a very important one, for the reason that the Rush creek section was for a long time regarded as a poor quartz section. The results at the Mount Georga so far will tend to revive prospecting throughout that locality, as a number of ledges are known to exist there. The ledge at the Mount George is 2½ feet wide.

Placer.

MINES DOING WELL.—Colfax *Sentinel*, Oct. 13: The miners on the American river near Gold Run are still working and doing well.

The Morning Star mine at Iowa Hill has undergone considerable repairs during the past few weeks, and will soon be ready for work again. Besides a fine new stamp-mill, a great deal of the main tunnel has been retimbered.

Mr. Gould of Iowa Hill, who has been for a long time near Iowa Hill prospecting for the main channel, has at last struck it, and, like the rest of the channel on that divide, it prospects fine.

Sam McKinn and Paul Lavean of Alta recently bought part of Golden Eagle canyon, in which the tailings from the drift mine of H. Dreslar were dumped last year. They have been at work cleaning it up.

Messrs. Gould and Doolittle are pushing the tunnel at Gold Run. They are trying to find drift ground.

C. E. Gillette, who does most of the preliminary work of the Debris Commission, inspected the Liberty Hill dam in Bear river last week. This dam, in spite of Judge Sawyer's opinion, has stood the test for the past 12 years and now stands as firm as ever. If the dam should be raised, and a new wasteway made, it would be as solid as ever and prove an effective barrier to the tailings for many mines above it.

There is a probability of the Alta drift mine at Alta being worked again. This mine was worked several years ago, but, owing to litigation and other causes, was closed down, notwithstanding good paying gravel was being worked. The gravel in this mine is the same as in the Hidden Treasure at Sunny South, and no doubt will prove a good mine if worked again properly.

W. Rodger, who has had charge of the Dam claim belonging to Mr. Weske, recently struck what is supposed to be the Hidden Treasure lead. The main tunnel of the Dam claim has been pushed ahead of late in hopes of striking the blue lead which had run out. The Dam claim at one time was a good-paying mine, the gravel being of the blue lead. A few years ago it gave out. This blue lead intersected and cut off the white lead which paid so well in the old Mountain Gate mine at Damascos, and which is still paying well in the Hidden Treasure of Sunny South. The tunnel of the Dam claim last week was run into the gap between the Hidden Treasure and the Mountain Gate at about 80 feet lower than the channel of the Hidden Treasure. To the surprise of the owners of the Dam claim, some of the same character of gravel as is now being worked in the Hidden Treasure was struck. The tunnel was run about 15 feet into the white gravel, but, on a survey being made, it was found to be on the Hidden Treasure ground, so Mr. Weske abandoned the work. If it should prove that there is much of a body of gravel in the gap where none was supposed to be, it will prove a great find, as the gravel prospects very well. The tunnel of the Dam claim is in about 6000 feet, but, as there is no more paying ground in the blue lead through which it runs, it will be abandoned, unless the Hidden Treasure should find enough of the white lead in the gap to justify working through the Dam claim tunnel.

Plumas.

MINE LEASED.—*National-Bulletin*: Russell & Simmons have leased the Reece mine at Washington Hill, near Onion valley, and took a load of supplies there for the approaching winter. It is a gravel mine which, during the many years past, has yielded good returns. The lessees hope to be able to work quite a force of men next year.

Shasta.

THE INTEGRAL MINES.—Redding *Free Press*, Oct. 14: Prof. Archibald B. McCaw is at present shipping in supplies to the Integral for the winter, and has between 40 and 50 men em-

ployed. Besides the necessary supplies, he is also shipping a 50-horse powsr engine and boiler, a Cameron sink pnmp and hoisting works, some 30-inch pipe for condensers and other necessary macbinery. Three shifts of men will be employed iu sinking a 500-foot shaft on the Bostou and in making prepaiations to open up levels, etc. Tunnels are being pushed on the Temple and Del Norte claims. Already the company has shipped several hundred fiasks of qnicksilver. Several condensers are now being bnilt, which will be lined with cement to prevsut the escape of the silver. Unless due precautiou is taken, a great qnsntity of the metal escapes. To illustrate tbis fact: Iu cleaning out one of the smokestacks receutly, 36 flasks of quicksilver were recovered from tbe lining of wood inside where it had accnmulated. Mr. McCaw says that the company will uot only gnard against all leaks and losses, but will, with improved machinery and every means known, reduce the cost of its production, and tbus be prepared for the lowest market price of the prodnct.

As soou as the Altoona Company settle their difficulties—aud, by the way, the Intsgral own claims all around the Trinity aud Altoona claims, then the compauy will purchase the Altoona iuterests, and control the eutire quicksilver deposits of the district. Then, indeed, the outpnt will bs immense and au awakening influence will be felt in both Trinity and Sbasta couuties. Alexander McCaw, the superiutendeut, is at presant seeking to recrnit his energies iu British Columbia, but will eoon return refreshed and ready for bnsiness. Prof. McCaw will remaiu here until Alexander's return, wheu he will go to London on a vieit to his family.

LOCAL NOTES.—Shasta *Courier*, Oct. 11: Mr. P. Stolberg brought to thie office a aample of rock takeu from the mine ou Shurtleff Hill, just outside the town limits, which was as pretty a piece of rock as we have seeu for a long while. The ledge is owned by Messrs. Flick, Stolberg and Mauer, who have uo donbt got a regnlar bouanza ou their hande. They have pusbed the tunnel in a considerable distance and the ledge is over three feet wide and improving as the tunnel is advanced. An assay made by F. P. Satterlee from samples firet takeu ont, goee $51.67 per ton iu gold. A small force is working ou the ledge and the ownere iuteud to properly develop and work the mine, as they are fully able to do so.

Tbe Distlehorst dredger has been anchored ou the riffles between Middle creek and Reddiug for the past few weeke. The boye have made a big succese of the dredger so far and there is uo reasou why the river above should uot pay as well or better than the place where it formerly worked.

Johuny Early and Chas. Smith are rnuning an 800-foot tunuel ou the old Smith miue, a few miles from Frencb Gulch.

The Gladstone, which has laid off a considerable uumber of men, will employ a larger force thau ever when general operatious are resumed, and the battery capacity will be increased to the extent of teu stamps.

Sierra.

TO WOEK THE TAILINOS.—Sierra Valley *Leader*: Mr. J. W. Kerr of San Francisco wae throngb here this week ou his way to Sierra City. This gentlemau goes there for the pnrpose of working the tailings dump of the Young America mine. He and several other geutlemeu have made arrangements with the Youug America owners and they will commence work at once. They will put up a plant, which for the preseut will consist of four arrastras, and they will employ from ten to fourteen meu. There is estimated to be about 150,000 tons of tailings, which will all be put through the arrastras. What the valuatiou of these tailings ie would be hard to tell, but from another source we learned that they are estimated to be worth from four to six dollars a ton. Mr. Kerr will enperintend the works, and they will be well managed uuder hie eupervieion, ae he has had cousiderable experience in work of thie uature iu this country aud Mexico.

Siskiyou.

A RIOH FIELD.—Yreka *Journal*, October 11: Owing to the demoralization of the silver-miuing industry, iu which so much capital has beeu iuvested, the mining operators with meaus to invest are seeking gold-miuing properties, which are certaiu to be of permanent value, aud there is uo couuty iu this Golden State offering a more extensive field of success tban Siskiyon. Not only is the surface valuable for placer miuing in the way of groundsluicing, driftiug, hydraulic-piping, creek and river-bed working, etc., but all the mountains are loaded with rich qnartz veius, worked ou a small scale only, as yet. The opening of uew wagou roads into remote sections siuce the advent of the railroad, ie uow affordiug good opportnuity for transportation of heavy mining machinery aud apparatus, instead of relying only on pack mulee as heretofore; hence from uow on the gold product is likely to be much greater than ever before. New improvements in river mining are ueeded, also larger and better quartz mills, and other apparatus of ecientific uature for saving fine gold and separating it more successfully from the sulphurets. All these are gradually being introduced as our mines are developed, aud the time is uot far distaut, if not already present, when Siskiyon will stand at the head of all counties in this State as the champiou producer of gold.

Iu the Hnngry creek mines, in the Siskiyou foothills, J. L. Coyle has a promisiug ledge of quartz, from which he has already taken a large amount of ore, to be crnshed shortly in the mill near the Sterling mine. Mr. Coyle has let a contract to sink a shaft 50 feet down, which will develop the ledge to a great extent.

The Sterling mine, iu the same locality, aleo looks well, and is to be opened on au extensive scale, the amouut of quartz iu sight showing sufficient quantities to keep the mill busy for several years.

The Spsncer & Co. mine, in the Siskiyou foothills near Coles, has been shnt down temporarily, bnt the owners feel confident of being able to realize extensively whsu work can be continned. Some of the company lost heavily by the closing of banks dnring the panic of a couple of months ago bnt hope to be in condition for starting work again on the mine next spring.

NEVADA.

Peavine District.

THE GEAY EAGLE.—The Reno *Gazette* says: Mr. Atwood, the well-kuown mining expert, who is 83 years of age, was in Reno the other day, accompauied by Capt. W. F. Mills and D. Dickey, and visited the Gray Eagle mine ou Granite Hill, two miles uorth of Lemmon's miue. Mr. Atwood, who is working iu the intsrest of New York capitalists, prouounced tbe mine to be a very good piece of propsrty, and he said he had uo donbt it would prove very valnable if developed. He had three photographs taken, showing the miue and surrounding couutry from different points of view.

Young America District.

ROUTE TO BEUNEAU MINES.—The Winnemucca *Silver State* is requested to publish information as to the best wsy to reach the new Brnnean gold fields.—Virginia *Chronicle*. Elko is tbe nearest point ou tbe railroad, says the *Silver State*. There is a fine wagou road from Elko via Wayland's, Tncker's, Murphy's raucb, Mrs. Johnson's, Mr. Stofel's, Island mountain, and Hugh Martin'e to the snmmit immediately sonth of Brnnean river. This route leads to one of the uew mining districts on the river. To go to the lower district the road forks a few miles this eide of Island mountain and passes through Mountaiu City in the uorthern part of Elko county. To strike the Brnueau river at another district and in the vicinity of the middle fork of the Brnneau river, the town of Deeth ou the railroad above Elko is the proper place to leave the railroad.

A person going from any part of western Nevada by team or horseback, wonld follow up tbe Hnmboldt river to Winnemucca, thence to Paradise, thence to Tnscarora; or to Battle Mountain, tbence to Tnscarora. Tbere is uot much difference between the last three uamed routes. At Tnscarora tbey can be pnt on the beet route from there. The route from Tnscarora we are not acqnainted witb.

To go to the upper district or to the middle fork, the Deeth route ie the proper one. Tbe Elko ronte has the advautage of good accommodations at the ranches every ten to twelve miles after arriviug at Waylands, which is 23 miles from Elko.

THE NEW GOLD FIELD.—Alex Penrod writes the *Independent* from Island Mountain that he hae jnet returned from the Young America mining district in the Bruneau conntry and gives the following account of what he saw:

"Some very ricb prospecte have been strnck by the miners out there. There are some 22 claims already located which ebow up coarse gold in paying quantities. Water is very plentiful. About 500 inches rnu down the Brnneau river with a big fall.

"I was shown a bank of gravel over 280 feet high which showed a flattering prospect on top and that the gold must be very coarse on bedrock. A boulder, weighing about 20 pounds, found by Mr. Joseph Lang, shows gold all over it. The miners, working with pick and shovel, average about $1.25 per hour to the man. Ae soon as pipe and machinery are brought in, wbich will be soou, with plenty of water witb a big fall, Young America district will surely become a big gold producer."

Ferguson District.

GEEAT GOLD PEOPEETIES.—Pioche *Record*, Sept. 28: J. B. Stevens, mentioned last week as going to Fergusou district iu the interest of Sau Francisco parties, passed a few days iu the district, eampled some of the claims, uotably the Jim Crow and the Monitor, and set out on his returu to Sau Francisco ou Tnesday. He says if the ore body in the two named mines will average $20 a ton, one of the biggest gold properties in the couutry exists there; that he wonld have his samples carefnlly assayed, aud might return here again in a month, to remaiu about that length of time. Those who know the Jim Crow aud Monitor claims etate that, if the samplee were fairly taken, there is no doubt bnt that the assays will show au average value of more than $20.

Ely District.

THE YUBA.—Pioche *Record*, Sept. 28: Since closing the Yuba mine a few weeke ago, foul air has accnmulated so rapidly that it is impossible to get lower iu the shaft thau tbe 12th level. The work of couuecting this mine with the lower workiugs of the Old Mazeppa is being pushed from the 9tb level of the Old Meadow Valley shaft No. 3, through the Mazeppa workings, and is believed to have progressed almost far enough, 12 feet remaiuing yet to be rnn according to measurements taken. Soundinge from the west end of the 13th level, Yuba drift, would practically settle the matter conld they be made, and, should the work fail to connect withiu a few days, steps will be taken to rid the Yuba of its foul air, thongh this is uo email task, and prosecute the work again from that end.

ARIZONA.

MINES BONDED.—Tombstone *Epitaph*: The Dragoon monntains uear this city are now being accorded a merited share of attention from capitalists. The past week has witnessed the consummatiou of a boud ou the very promising group of copper mines situated thereiu and belonging to Mayor Fitts and Jas. Barrett. The amonut of the bond is stated to be $30,000. This gronp has alwaye been esteemed one of the best prospects iu Cochise county. The ore in sight runs from 6 to 60 per cent and the supply is inexhaustible.

Mr. Sketchley, who has beeu in Tombstone for some weeks, represents a substantial syndicate in London, whither he has jnst gone to submit his report on the property, which he has thoronghly experted. Tbe development of these mines and the erection of the contemplated smelter will give employment to a large number of now idle men in this city, and Mr. Sketchley's retnrn is impatiently awaited.

A RICH STEIKE.—Prescott *Journal-Miner*: A letter from tbe Old Reliable Gold Works says: "This quiet bnt bnsy camp has been vsry agreeably surprised by a rich striks ou one of the company's claims, the Anaconda, au extsnsion on the Wild Flower lead. The first assessment work and the only work ever done ou this particular gronnd is uow being done, consisting of a crosscut on the lead. Already 30 feet ot work has been done, and no foot-wall yet. The ore is in layers or streaks, and very nearly the whole ledge is ore. As soon as the crosscut is finished, drifting will be commenced on the ore. There is every indication of immense quantities. as this is by all odds tbe largest lead in the Bradshaw mountains."

STEIKE AT BIO BUG.—Prescott *Courier*: A rich strike is reported in ths Poland mine, Big Bug district, the ore assaying $77 gold aud 48 ounces silver per tou; pay streak 12 feet wide. This property is dsveloped by a tnnnel 500 feet in length, the first 70 feet of which was run in non-paying formatiou, after which a strong ledge was struck, the ore rnuning from $10 to $15 per ton gold, 20 to 30 ounces silver and from 30 to 60 per ceut lead. The miue is owned by Messrs. Mnrphy & Dickey, but is being worked under lease by C. A. Raudal.

IDAHO.

MINEES TO RESUME OPERATIONE.—A epecial from Wallace, Idaho, Oct. 12tb, says: The Canyou Creek miues and the Gem aud Frisco mines uear here will start up Monday with a full force of men. The Miners' Union has practically won this fight, for $3.50 will be the nniform scale of wages, although the rate demanded a year ago was $4 for miuers aud $3.50 for carmeu and shovelers. With this settlement all tronble between the Miners' Union and Mine-Owners' Union is over unless there is trouble becanse the Wardner miners, who went to work several weeks ago and who made a contract with the ownere, are working for $3 a day, which is uot expected. With this settlement reached to-day, the leaders of both sides say that about 3000 meu will be working within a month, and the pay-roll will then reach nearly $500,000 a month. The ontpnt when tbe Cœur d'Alene mines are rnnning full blast, as thie uew agreement is snpposed to canse them to, will be about 400 tons of lead and 17,000 ounces of silver a day.

IN GOON CONDITION.—Idaho *Avalanche*, Oct. 14: Hon. W. S. Haskins, mine inspector for Idaho, visited onr camp the first of the week. He visited the DeLamar mines Mondav. On Tnesday he spent the day on Florida, and took his departure on Wednesday morning. From him our reporter learned that all mines visited were in excellent conditiou, as regards timbering and ventilation, and he speaks in tbe highest terms of the treatment he received at the hands of mine managers here. In a conversatiou bearing ou the geueral conditiou of the country, he said that we of Owyhee had uo concention of the distress and hardships which afflicted other portions of our State and conntry; that we had no kick coming, comparatively speaking.

MONTANA.

WORK RESUMED.—Butte *Inter-Mountain*: Tbe uews of the resumptiou of work at all of the Anacouda properties in this city after a shutdown of a few days, was received with delight by the large army of workingmen employed by the company. The force at the High Ore resnmed work yesterday morning.

The Butte & Boston, Boston & Montana and Heinze properties are being operated as uenal. At the Buffalo, whicb is under lease to Finlen & Hines, 225 tone of ore were shipped last montb, and 100 tons now await shipment ou the dnmp. The force of miners at thie property is distributed on the various levels, a few only being employed in extracting ore, the majority of them being eugaged in proepecting and development work. The ore is shipped to the Anaconda works for treatmeut.

Many of the prospectors who have been out all summer are retnrning to town. Some of them have beeu lucky aud located promising claims. Madison county is etill the favorite spot for the seekers of the yellow metal, and many valuable discoveries have beeu made tbere during the past season. With the completion of the Helena & Dillon railroad next year Madieon conuty will experience a gennine boom. There are a number of minee near Sberidan wbich would pay handsomely if the railroad facilities were ench that the ore could be shipped at a moderate cost. At present the transportatiou cbarges alone on ores shipped from there to Butte amount to $9 per ton, and, euch being the case, only the ricbest ores are worked. With cheaper rates, many of the mines containiug low-grade ore can he profitably worked.

THE ALPS.—Johu W. Opp retnrned from Bntte last Snnday, says tbe Phillipsburg *Mail*, where he spent several days attending to business connected with the Alps Miuing Company.

The boud of the Anaconda Company ou the Alps propsrty will expire this mouth, and if the company fails to raise the bond, then the ownere will at once proceed with operations. A full force of men will be put to work and the mill will be started up, giving employment to about 25 men.

The Alps is a first-class gold property, and when once in operation it will probably continue without interruption and prove a valnable enterprise to tbe owners.

THE BI-METALLIO.—The Bi-Metallic 100-stamp mill, near Phillipsbnrg, ceased operations entirely last week, says the *Silver State*. A few men, however, are still employed "cleaning up," and when that is completed the pay-roll will diminish from several hnndred men to abont a dozen watchmen. A crosscnt from one of the lower lsvels in the Bi-Metallic to the Butte tnnnel was recently completed, and as the Granite mine is connected with tbe Bi-Metallic by a crosscnt from the fourteenth level, both mines are drained into the Butte tnnnel, thus avoiding the expense of keeping tbe pumps in operatiou while the mines are shnt down.

OREGON.

RICH POCKET REPOETED.—Baker City *Democrat*, Oct. 9: It has leaked ont. bnt the accnracy of the report is uot corroborated at headqnarters, that the Virtne mine is richer than ever; that tbe great find of gold made several weeks ago, when it was estimated that $45,000 was taken out of a pocket, does uot compare with tbe find made a day or so ago. It is stated tbat the last "pocket" was so rich tbat tbe miners were bringing up the precions metal from tbe lower level to the surface in boxes. Whether the report is true or not we do uot know, bnt estimates made ou the find place it as high ae $75,000.

FINE OPALS.—Baker City *Democrat*, Oct. 9: The opal fields on Bnrnt river, near the farm of Mrs. Engene Smitb, are attracting cousiderable attention, and the precious stones found there carry the flue and variegated colors tbat make the Mexicau opal so valuable. Yesterday, Mr. J. W. Hall, a resident of the section where the opals exist, displayed a small vial containing many of these stones, eome of wbich were very handsome, one especially that Mr. Hall sent away aud had cut. Several persons are proepecting the fielde and with good success.

A VIEIT TO GRANITE.—Baker City *Democrat*, Oct. 9: F. T. Abbott, and W. F. Snodgrass of the *Gazette* of La Grande, retnrned Friday morning from a week's visit in the Granite Creek district. The Granite dietrict is alive with miners, moet of whom are eugaged in development work. The principal working mine is that of tbe Cable Bros., who are now ehipping a considerable amount of ore to the Tacoma rednction worke.

The district abounds in exteneive placer claims that have been worked during tbe entire snmmer, Granite creek having afforded snfficient for contiuuous operations. Tbe Monnmental employs a force of abont 20 men, and is once more rnnning on fnll time.

STRIKE ON MONOEE CEEEK.—Rogue River *Courier*, Oct. 12: Miune Caldwell and Sam Ryan have "etrnck it ricb" on Monger creek, a tributary of Williams creek, about 25 miles from Grant'e Pass. They are getting out good gold with pick and pan, and indications are tbat tbere is plenty of it abead of them. Tbis regiou lies along the bonndary of Josepbine and Jackson counties and was overlooked in the mad rnsh for rich placers 35 years ago. Tbe cauyons over there are full of hopeful prospectors, and old settlers predict flush times tbere this winter. Water is plenty and the bedrock ie found from four to ten feet.

J. C. Taylor, who has been bnsy at Galice creek all fall, reports things progressing in tbat part of Josephine aud predicte a bright future for the mines there. He has recently set up 1048 feet of giant pipe, which tapere from 23 inches in diameter down to tbe monitor with a splendid fall of 335 feet.

WASHINGTON.

OLD DOMINION RESUMES.—Colville *Republican*: Tbe Old Dominion Mining Company whicb bas been employing a emall force of men dnring tbe past two montbs, has made arrangements for more extensive operations, and accordingly has put on au additional force of 20 men. The force uow uumbers 40 miuers, and as soon as the concentrator etarts up, wbicb will be in abont two weeks, 20 more men will be added to tbe working force of the mine. Supt. Hanley has done much to improve and develop the property.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCT. 3, 1893.

506,055.—TRUNK AND DRESSING CASE—W. Burkman, Tacoma, Wash.

506,034.—INSULATING JOINT—S. W. Burtchaell, S. F.

506,037.—DEVICE FOR PASSING OBSTRUCTION — G. H. Forbes, S. F.

506,040.—BURGLAR ALARM—A. Hartman, Hawthorne, Nev.

506,115.—STOP VALVE—W. A. Johnston, S. F.

505,948.—THRASHER FEEDER—A. H. Lubking, Pomeroy, Wash.

506,079.—SLED PROPELLER—F. A. Schaefer, Truckee, Cal.

506,080.—SLEIGH—F. A. Schaefer, Truckee, Cal.

506,141.—ENGINE VALVE—H. H. Ward, S. F.

506,142.—HARNESS—L. J. Weatherway, Aberdeen, Wash.

22,825.—DESIGN—I. G. Hazzard, East Portland, Ogn.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 19, 1893.

The feature of the week in the metal market has been the very decided weakening of lead. There seems to be no very good reason for it, as the reports to dicate no overplus of supplies. It is probable that the resumption of operations on the Cœur d'Alene had as much to do with it as anything else. Silver has weakened slightly during the week. There has been no essential chaoge in copper. Consumption abroad is very large, and the statistical situation is promising.

Circulation of Money.

The present circulation of money in the United States is the largest ever recorded, according to the statement issued by the Treasury Department on October 1st. The aggregate circulation is given at $1,701 939.918, which amounts to $25.29 per capita tor an estimated population of 67,306,000. This is an increase of $21,377.247 during the month of September, and of $105,889.935 since October 1, 1892. The chief items of increase are $14,829.741 gold, and $5,052,317 National Bank notes. The issue of standard silver dollars in actual circulation is $58,832,668, the silver certificates in circulation are $324.955.134, and the treasury notes $148,824 199, making the silver money of the country in actual circulation about $533.000,000, in addition to $64,102,205 in subsidary silver.

The circulation, by the Treasury figures, is now 85 cents more per capita than on July 1, 1892, about $2.50 more than on July 1, 1890, and nearly $6 more than on July 1, 1880. It is nearly 50 per cent in excess of the per capita circulation immediately after the resumption of specie payments on July 1, 1879, when the amoonnt was $16.75.

Coinage of the Mints.

During the month of September, the United States Mints coined 714,874 pieces of gold of the valne of $5.932,270, 2,382,400 pieces of silver of the value of $805.185, and 4.360,600 pieces of minor coinage of the value of $76,818.

Mining Share Market.

SAN FRANCISCO, Oct, 19, 1893.

The Comstock market is experiencing a revival, caused largely by the ratification of the deal between James H. Rule and the Con. Cal. and Va., whereby he agrees to uncover a rich body of ore above the 1100-foot level. Tuesday Con. Cal. and Va. advanced to $2.50, while Ophir and most of the other stocks had a proportionate advance, with large transactions. The feeling on the street is now more hopeful.

Wednesday, however, some weakness developed, and Con. Cal. and Va. dropped back to $2.

This activity in the market has taken place despite the action of the miners' union in refusing to concede a reduction of wages.

It is said that other expenses have been materially reduced, and the mines will continue to operate as long as they can secure funds. On and after Monday, Oct. 16th, the price of lumber delivered at the Comstock mines was to be reduced from $22 to $19 per 1000 feet, and wood will be reduced from $9 to $7.50 per cord. A material reduction, in some cases amounting to 50 per cent, has been and is being made in the cost of water furnished to the mines. Transportation of ores will be scaled down. Salaries have for the past two months been 25 to 50 per cent below what they previously were. With such reductions as have been made, some of the mines will go on, and it may be that new bodies of ore will be uncovered in them. Other mines may have to close down.

Charles T. Harper, foreman of the Consolidated California & Virginia mine, who was sent for by James G. Rule a short time ago, has been in the city closeted with Mr. Rule, and together they discussed a plan of operations for the futnre campaign in the upper levels of the mine. Mr. Harper will return to Virginia City and get everything in readiness for the proposed work at the old Con. Virginia shaft, so that there will be no delay. By the time Mr. Rule is able to go out they will be ready to start this work. Mr. Harper says that no work has been done in the section above the 1100 level, where ore is expected to be found, since Mr. Rule left the mine in 1886, so that no chances for finding ore have been exhausted.

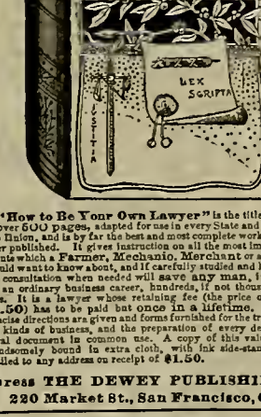
Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from H. Buckley and Louis L. Hillman for permission to mine by the hydraulic process in the Illinois Gold Gravel Mine, at Secret Diggings, near La Porte, Plumas county, California, and to deposit tailings in an old hydraulic pit, hereby gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on October 24, 1893, at 1:30 o'clock P. M. On and before this hour and date all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A, Secretary of the Commission.

NOTICE.—The California Debris Commission, having received petitions to mine by the hydraulic process from Westall and Hughes, in the New York mine in Sierra county, to deposit tailings behind a dam in Howard creek; from Corbiere and Bean, near Clipper Mills, Yuba county, to deposit tailings behind a dam in Hampshire creek; from W. A. and M. E. Schofield, in the Phœnix mine, near Hepsidam, Sierra county, to deposit tailings behind dams in Whisky creek and the North Fork of Slate creek; from the Craycroft Mining Company, in the Craycroft Hill mine, near Downieville, Sierra county, to deposit tailings behind dams in Davidson ravine; from the Excelsior Mining Company, in the Excelsior hydraulic mine, near Downieville, Sierra county, to deposit tailings in and near Eagle ravine; from the Eureka Mining Company, in the Eureka mining claim, near Downieville, Sierra county, to deposit tailings behind dams in Kanaka and Sawmill ravines, and from the Quincy Mining and Water Company, in the Bean Hill, Jack's Hill, Mountain House, Gopher Hill and Shore's Hill claims, near Spanish Ranch, Plumas county, to deposit tailings in old hydraulic pits and behind dams in Maurer ravine, Spanish creek and Green flat, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on November 7, 1893, at 1:30 o'clock P. M. On and before this hour and date all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary of the Commission.

$1000 WORTH OF LAW FOR $1.50.



"How to Be Your Own Lawyer" is the title of a book of over 500 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or anybody else would want to know about, and if carefully studied and kept at hand for consultation when needed will save any man, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, **$1.50**) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of **$1.50.**

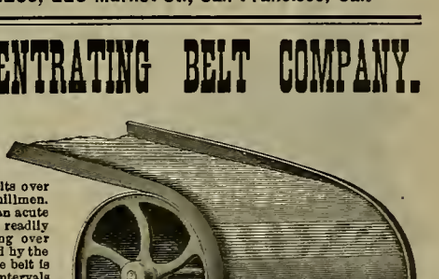
MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco, Cal.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having onr new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Trinmph and Frue machinee, bnt can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the freqnent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

THE RUSSELL PROCESS.

See Exhibit at World's Columbian Exposition, Chicago, Mining Building, Southwest Gallery, Location, Column 25B.

INVENTORS, TAKE NOTICE!

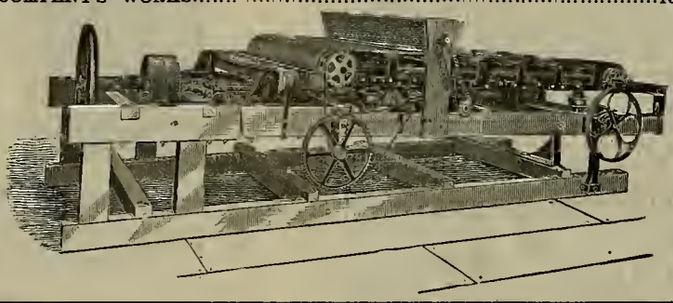
PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, IOO, SHASTA CO., CAL., May 25th, 1893.

MR. THOS. MCGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a True as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

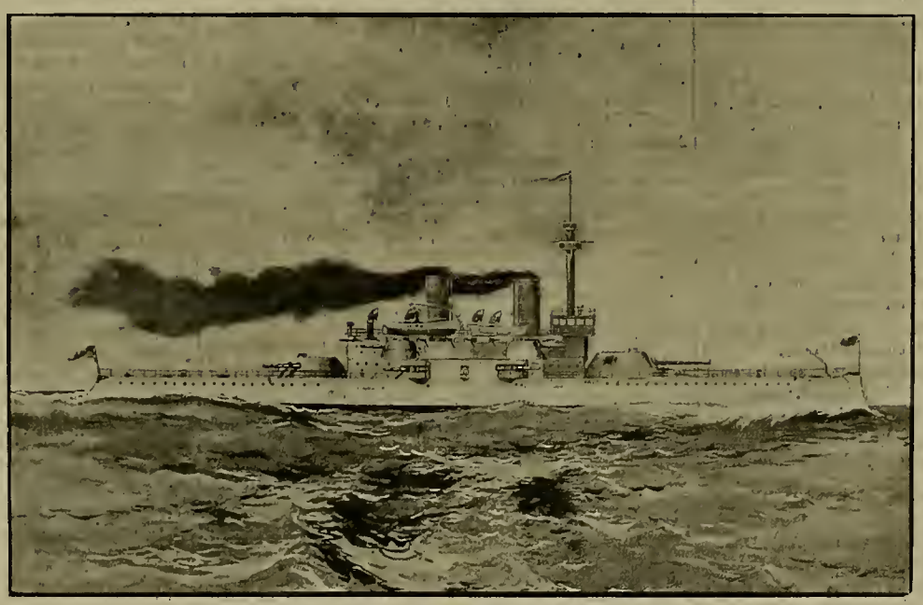
Launching of the Oregon.

The battleship Oregon, the most formidable of the new American navy, was launched from the Union Iron Works at the Potrero, San Francisco, Thursday, Oct. 26th, at 11:46 A. M. (high tide). The Oregon is not only the largest vessel in the navy, but has the largest displacement of any vessel ever launched in American waters. The event was celebrated with great splendor and enthusiasm, in the presence of a tremendous crowd on shore and in a fleet of vessels on Mission bay. Miss Daisy Ainsworth, representing the State of Oregon, performed the christening, while Miss Eugenia Shelby, representing the city of Portland, pressed the button that started the great vessel down the ways. No accident occurred.

The Oregon has been frequently described, but it is appropriate again to give a few of the leading facts and figures relative to her construction: The vessel, when complete, is to have a displacement of 10,298 tons, and her principal dimensions are: Length, 350 feet 9 inches; breadth, 69 feet 3 inches, and depth, from keel-plate to superstructure, 42 feet. She was contracted for under the Naval Construction Act, passed by Congress June 30, 1890, and is to cost, exclusive of armament, nearly four million dollars. The minimum speed to be maintained for four consecutive hours is to be not less than 15 knots. The hull is of steel, not sheatbed. Her framing is on the bracket system, and she has a double bottom extending from armor-shelf to armor-shelf, and forward and aft. The armor on her sides, for protecting the water line, will have a maximum thickness of not less than 18 inches, with a mean depth of seven feet, and the transverse armor at the ends of the belt line will not be less than 17 inches thick. The sides from armor belt to main deck, will be protected by not less than five inches of steel armor.



THE U. S. BATTLESHIP OREGON.

Coal is to be carried back of this casemate. An armored deck, not less than three inches in thickness, will extend forward and aft from the ends of the armor belt, being curved down on each side to meet the side of the ship below the water line. Over the side armor belt this steel deck will be not less than 2¾ inches in thickness. The Oregon will have an approved water-excluding material equal to woodite or cellulose, fitted along the sides, forward and aft, on the slopes of the three-inch protective deck.

She will be supplied with powerful guns, aggregating in all 631 tons. They will include four 13-inch breech-loading rifles, weighing 60 tons each, with their mounts, shields and equipments; four eight-inch breech-loading rifles; four 6-inch breech-loading rifles; sixteen 6-pounder rapid-firing guns; six 1-pounder rapid-firing guns, and two Gatlings, with all necessary mounts and shields therefor. It will require 306 tons of ammunition to complete the vessel's fighting outfit.

Her 13-inch guns will be protected by 17 inches of armor. The axes of these guns are to be not less than six feet above the deck, and due regard must be paid to interference of fire and the effects of the blasts of the various guns. The six and eight-inch guns will be protected by shields, and, in addition, by barbettes or otherwise, carrying four-inch armor for the six-inch guns, and six-inch armor for the eight-inch guns. The ammunition for the eight-inch guns will be supplied through armored tubes.

The Oregon will carry 12 torpedoes. There will be seven above-water torpedo tubes—two forward, one aft, and two on each side. She will also carry a distilling apparatus, which will supply fresh water; the allowance of water to be carried is to be enough to last 15 days, besides water for sanitary purposes. The vessel will have a complete electric-light plant.

The special duty of the Oregon will be to engage in conflict with any vessel of any hostile fleet; to protect our ports from invasion and bombardment from sea; to act as convoy to merchant fleets in time of war; and to perform any large sea service that may arise in the emergency of war. Her equipment is powerful enough to insure that the dignity and honor of the nation will be preserved on the seas against all comers, if she is intelligently manned.

The Union Iron Works have contributed to the navy a number of its fleetest and most serviceable cruisers, besides the Oregon. The extent of its work in this branch of naval construction is indicated by the following:

CRUISERS BUILT BY THE UNION IRON WORKS.

THE *Mountain Messenger* at Downieville, Sierra county, appreciatively declares that the MINING AND SCIENTIFIC PRESS is the only paper except the daily *Report* which has stood up for the miners' cause. Says the *Messenger*: "The *Chronicle*, *Examiner* and *Post* have all declared for the miner, but in a half-hearted way, as if in fear of insulting the valley people, and dare not call their souls their own."

To Mine the Sacramento's Bed.

A river mining enterprise of large proportions has been organized at Redding, Shasta county, having for its object the working of gravel in the bed of the Sacramento river from Turtle bay to the free bridge. The promoters of the scheme are the local electric light and water companies and the Deakin Brothers. The Shasta County *Democrat* says the company intends to make use of and complete the shear-dam the Electric Light Company has been putting in, and turn a great volume of the water into the Electric Light Company's ditch, which is large enough to carry nearly all the water in the river at this season of the year. By accomplishing this—and competent engineers say it can be done at a reasonable cost—they will be able to work the rich gravel below the dam. There is no question about the gravel being rich in gold, for that has been proven without any guesswork. Miners who have worked in the gravel for several seasons past in water up to their waists have been and are now making big wages. Aside from this the company contemplates continuing the ditch down to Cottonwood for irrigation purposes, and will endeavor to interest foreign capital in this irrigation scheme.

As soon as spring opens a large force of men will be put to work and operations begun on a big scale. The company will work day and night. Electric wires will be run from the Electric Light Company's power house, and the work by night will be accomplished with the aid of arc electric lights strung along the river. This enterprise will give employment to several hundred men.

THE bill changing the end of the assessment-work year from December 31st to September 30th, which recently passed the lower house of Congress, has likewise passed the Senate with an amendment excluding corporations from its benefits. The concurrence of the House is now needed to make the measure a law. The Senate amendment is inexplicable. It is not based on justice or a proper view of the needs and wishes of the miners. It will serve simply to muddle the whole matter, and provide one law for corporations, another for private owners of mining claims. The bill does too much, anyway. In view of the hard times, no one will seriously object to suspension of the present law for nine months or for a year. Miners, particularly in Colorado and Montana, need encouragement and relief. But the change in the law should be temporary, not permanent. The assessment year is satisfactory as it is.

CONGRESSMAN CAMINETTI is still after reservoir sites and proposes to store them up in time. It is a wise provision. A bill he has just introduced provides for conditional grants of lands and lakes to the State of California and the counties and irrigation districts therein for storage reservoirs, for irrigating, mining, manufacturing, or any industrial or other useful purpose. The Secretary of the Interior is intrusted with the execution of the law if it should become such.

MINING AND SCIENTIFIC PRESS.

Office, 220 Market Street, Northeast corner Front, San Francisco.
Take the Elevator, No. 12 Front St.

Terms of Subscription.

Annual Subscription, $3. New subscriptions will be declined without cash in advance. All arrearages must be paid for at the rate of $3.50 per annum.

Advertising Rates.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The U. S. Battle-Ship Oregon, 273.
EDITORIALS.—Launching of the Oregon; To Mine the Sacramento's Bed; Miscellaneous, 273. Anti-Debris Advocates Then and Now; Mr. Caminetti a Trifle Hasty; Miscellaneous, 274. Proposed Change of Assessment Year; The Mineral Exhibit at the Fair, 275. Big Chlorination and Cyanide Works; The Comstock Tunnel Company, 276.
MISCELLANEOUS.—Studies in Gold Milling; Hydraulic Fields of Southern Oregon, 277. Treatment of Copper, Lead and Gold and Silver Ores, 278. Labor in South Africa; A Trip to Columbia Hill; Mining, Wages and Materials in Mexico; Sulphurets, 279. Foundry Notes; Slickens, 275.
CORRESPONDENCE.—Placer and El Dorado, 276.
SCIENTIFIC PROGRESS.—The Action of the Eye; Dimensions of the Fixed Stars; Skin-Grafting at San Diego, 280.
MECHANICAL PROGRESS.—Natural Gas; Treating Stones for Construction; A Sand Suction Dredge of 4000 Tons per Hour Capacity, 280. To Raise the San Pedro; Fast Passenger Whaleback; Consolidating Steel Ingots; Utilizing a Waterfall, 281.
USEFUL INFORMATION.—Germany's Zinc Product; Abuse of the Stomach; Remedy for Toadstool Poisoning; Healthy Bed Clothing; Rest in Motion; The Annual Ring in Trees; Why Better Western Than Eastern Records? New Safety Matches, 282.
ELECTRICITY.—Is Electricity to Replace Steam? Electricity in Gardening, 282. Agricultural Electricity; Inexpensive Electric Clock; Electric Ambulance; Against Paraffin; To Record Changes of Temperature; From Nothing to Near a Billion, 283.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 285-286.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 287.

EX-CONGRESSMAN JOHN K. LUTTRELL, well known to miners of this State, died at Sitka, Alaska, Oct. 4th, of Bright's disease. He was at the time of his demise United States Commissioner of Fisheries for Alaska. Mr. Luttrell was a pioneer, and was at an early date county judge of Alameda county. He was at various times engaged in mining. Some years ago he purchased a large tract of land in Sonoma county, and there settled down to a quiet agricultural life. Twelve years ago he was elected to Congress from that northern district. He served three successive terms and made an honorable record for himself. Subsequently he was appointed Prison Director by Governor Stoneman. During all this time he continued his agricultural pursuits. Mr. Luttrell took a very prominent part in the first State Miners' Convention, in January, 1892, and afterward rendered notable service to the miners as delegate of the convention at Washington. His death will be mourned by all miners.

AN incorrect report of Judge Searls' speech at the late miners' convention, appearing in one of the daily papers, has caused another teapot tempest in the Anti-Debris Association. Judge Searls, after declaring that George Ohleyer had said publicly he would "not approve a hydraulic-mining bill if God Almighty were to present it to him," appealed to Robert T. Devlin to corroborate his statement. There was no response; but an imaginative reporter thought he saw a chance for a fine climax, and he represented Mr. Devlin as calling out: "You are entirely right." Mr. Devlin, as a matter of fact, was not in the hall, and so no one heard him make any such response, and no one declared he made it except this one reporter through his newspaper. Judge Searls was fully and correctly reported in the MINING AND SCIENTIFIC PRESS, which contained the best report of proceedings published.

THE Comstock lode is by no means suffering from its first crisis. It has "been there before." Theodore Sutro, president of the Comstock Tunnel Company, tells when and how in his annual report: "In 1870 the market value of the entire lode, as represented in shares, was about $4,000,000, while in 1875, after the discovery of the bonanzas in the California and Virginia mines, it appreciated to about $275,000,000. In 1882 it had again declined to about $3,000,000, but on the discovery of the new ore body in the mine of the Consolidated California & Virginia Company in 1886, the market value again rose to about $36,000,000." This would seem to indicate that periods of depression may be expected about every twelve or fourteen years.

The letter of the Midwinter Fair committee of the State Miners' Association to the miners of the State will be found on page 285 of this issue.

Anti-Debris Advocates Then and Now.

The anti-debris papers have recently devoted an amount of their more or less valuable space to a rehearsal of the history of the anti-debris share in recent congressional legislation; and some way they seem to find it necessary to do a deal of explaining. The delegates who were sent on to Washington from the River Improvement Convention in 1892 were expressly instructed to work in conjunction with the delegates from the Miners' Convention.

It is well known that they totally failed to carry out their instructions, and that, on the contrary, they bitterly antagonized the Miners' Committee at every turn. Their course was as unexpected as it was unjustified. The Miners' Convention in this city, comprising delegates from all the mining and anti-debris counties, had clearly and unitedly laid down the lines of legislation, and there was no suspicion that the anti-debris people would not keep the faith. It is worth while at this time to recall some of the utterances of the foremost anti-debris delegates to the convention, as they were chiefly instrumental in bringing about the general conviction that entire harmony between the conflicting interests had been restored. They read very strangely in view of the subsequent utterances and actions of the present anti-debris representatives.

It is proper to say that the Sacramento and other anti-debris county delegations took a very prominent part in the discussion and made more and longer addresses, perhaps, than the miners. They had quite as much to do with shaping the policy of the convention as the miners, and from first to last there was no expression that was not friendly, considerate and, apparently, genuine. Following are extracts from the addresses of several gentlemen, all representing the anti-debris interest:

V. S. McClatchy of Sacramento:

We believe you will not do anything to injure us. We say that we extend to you the right hand of fellowship.

The Sacramento delegation came down to assist in any way it can in solving this great problem of finding some means for allowing the prosecution of hydraulic mining which will not injure the rivers or our homes, and in any means that will accomplish that object we are with you.

We will work with you, doing what we can to accomplish it. We want to stand together and foster every industry that will tend to develop its (California's) great resources.

R. T. Devlin of Sacramento, attorney of the Anti-Debris Association:

There is no people who would more gladly see the hamlets and the villages of the mining regions of California filled with a happy and prosperous population than the people of Sacramento. If it is meant to pass laws by which engineering skill may aid in determining the work, we will stand with you hand in hand.

Grove L. Johnson of Sacramento:

I desire to say that no body of men ever yet exceeded this convention of miners in their desire to make peace with their enemies and to cement friendship with them.

I find every man in this convention animated by the same purpose that, under God, I believe and feel, namely, to do all in our power to aid the miners of this State, and to once more pour forth from the mountains of the Golden State, that we all love, the millions of dollars that shall aid the commerce, aid the people and aid, if need be, in the throes of battle, the Government of the United States.

I believe to-day that there are engineers able, competent and willing to solve this question and to properly construct these dams in such a manner as, in the language of the resolutions, to impound the mining debris and prevent injury to the navigable waters of the State. That is all we ask; that is all any man ought to ask.

I believe if a united delegation goes to the national representative hall in Washington, and the farmer hand in hand with the miner of California knocks upon the door of the treasury of the nation, it will be open to us to carry out these works that we have projected and that we have endorsed.

Let the dead past bury the dead. Let all animosities be drawn and buried in the slickens you have deposited in the bed of the rivers.

Thomas J. Clunie of Sacramento:

If there ever was an industry that ought to be fostered and encouraged, it is the great industry of mining.

We have all joined hands together.

I say in the name of justice we are not asking too much of the Congress of the United States when we say to them: "You sold the mine to the miner; you sold the land to the farmer; and these great industries, in order to have our State flourish, must go hand in hand, and it is your duty to take such steps as are necessary to point out the way."

With the Government at our back, any plan suggested by them (the miners) will meet my approval, and you will find me walking hand in hand with all the miners of the State to bring about legislation that will foster both of these interests (farmers' and miners'.)

I know and feel in my heart that you will be successful. With equities on our side, they (the General Government) cannot refuse the requests of this convention.

C. P. Berry of Sutter:

I wish to disabuse the miners here present of a feeling that perhaps prevails among them, and that is that we are antagonistic to the mining interests. Such is not the case. We in the valley recognize the great importance of the output of gold. We are as anxious for gold as you yourselves dare be, and we are willing to shovel mud and build levees and drink muddy water, to the extent we can, and yet exist, in order to get your gold.

We don't wish to suppress any industry that tends to build up this great State.

Miners, we have accepted the pledge you have given—that is, that you will obey the laws, and that we will not be compelled hereafter to send spies into the mountains to see whether you are invading the law; and, therefore, accepting the pledge that you have given to us, now we are willing to second any effort that you will make so that the mining industry will be rehabilitated.

The miners have in no instance violated the spirit or letter of the resolutions of this convention. They accepted the statements of these gentlemen as pledges of like good faith on their part; and they are forced to the conclusion that they have either broken faith or they did not represent the sentiment of the people they pretended to represent.

Mr. Caminetti a Trifle Hasty.

Congressman Caminetti is reported by telegraph advices to have introduced in Congress "pursuant to a resolution adopted by the State Miners' Convention, Stewart's mining bill with the following change in section 2335 of the Revised Statutes, as contained in the Stewart amendments:" The provision recommended by the convention declaring that the "presence of rock in a place bearing gold, silver, cinnabar, petroleum or other valuable mineral shall be regarded as presumptive evidence that the land containing the same is and always has been mineral in character," etc., etc., follows; and also the declaration that the officers of the land department shall construe the provisions of law relative to the acquirement of title with great liberality.

Congressman Caminetti is precipitate, to state it mildly. He was not authorized by the California Miners' Convention, or any other organization, to present the result of their deliberations to Congress. The duty of embodying the views of the convention in the form of a bill was expressly vested in the hands of a committee which was to seek its own method of bringing the matter to the attention of Congress. The committee has not acted and has not communicated with Congressman Caminetti, or any other Congressman, and doubtless will not until it is ready. If Mr. Caminetti has been correctly reported, he has placed himself in the position of giving life to an all but moribund bill (the Stewart bill had not been presented at this session), very objectionable to the miners of California, after making only two of the several important changes strongly desired and urged by the convention.

California miners know that Mr. Caminetti has in the past rendered them important services; but hardly more valuable and not more deserving of appreciation than the services of other California members of Congress. His friendship, his influence, and his interest and energies are desired in the future. They will be sought with those of other Congressmen. But he has not yet been chosen by the miners to press their claims or represent their interests; and he should, in common courtesy, wait until they have expressed their desires to the delegation. The committee will in due time frame the bill outlined by the convention, and it will be presented with the endorsement of the miners of California. The criticism may then justly be made that Mr. Caminetti's bill is not what it has been said to be—the convention bill—and, it seems to us, his position will be somewhat awkward, both before Congress and before the California miners.

Mr. Caminetti would better withdraw his bill and wait till he hears from home.

IN an interview with a *Bulletin* reporter, Major Jones, of Oroville, says there is much activity in the mines of Butte county; but there is "no movement to reopen any of the old gravel claims under the Caminetti Act." Major Jones' statement is incorrect. Of 13 formal applications already made to the Debris Commission two are from Butte county. One, however is a new claim. But there are some 20 other mines which are or have been in correspondence with the Debris Commission relative to operation under the Act; and some of these are no doubt from Butte county. The resumption of operations in hydraulic mining is a large proposition and it takes time. But it is bound to come in one shape or another.

THE administration appears to have won its fight for the repeal of the Sherman Silver-Purchase Act. The silver Democrats have announced that they will no longer be parties to obstructive tactics, and it seems probable that an early vote will be reached. The silver men have made a strong fight in face of heavy odds. Desertion from their own camp was, apparently, the last thing they had to fear. Their success otherwise was probable. Now defeat seems inevitable. But they go down with colors flying, and are entitled to all the honors of war.

THE MINING AND SCIENTIFIC PRESS has been asked to state if the bill in Congress changing the assessment year relates to silver mines, or all mineral claims. The text of the bill has not been received here, but it may safely be assumed that it affects all quartz claims upon which annual assessment work must be done.

Proposed Change of Assessment Year.

By Hon. Edward A. Belcher, San Francisco, Member Executive Committee, Legislative Committee and Committee on Revision of Law, California Miners' Association.

My attention bas been called to a bill in the Congress changing the commencement of the "mining year" from January 1st to October 1st. The hill seems to have passed the House of Representatives and to have passed the Senate with the modification that it shall not affect corporations, and to have gone to a conference committee. The so-called "Stewart bill" contained a similar provision, and the legislative committee of the late California Miners' Convention, to whom the bill was referred for criticism, were unanimously of the opinion that a change of the law in that respect was inexpedient and ill-advised. They reported adversely upon tbat proposed change of the law, and tbeir report was adopted without dissent. I have not the bill before me and therefore can make only a general criticism.

As I nnderstand it, bowever, the bill is objectionable upon many grounds. At the outset it may be said that a law affecting mining interests ought to he general in its operation. As amended hy the Senate tbe proposed act does not affect corporations. It is not perceived why an exception should be made. It would be anomalous that the year within which Jones shonld perform his annual labor and make his expenditure should commence on January 1st and the year of the Jones Company, a corporation, should, for the same purpose, commence on the first day of October.

The law, as it now stands, is well understood and well settled. Mere novelty in legislation ongbt to be avoided at all times, particnlarly where valuable property rights may be disturbed.

Among other tbings the change, if made, would be almost sure to invoke that *bete noir* of the honest miner—the "jumper." Any legislative distnrbance of the *status quo* is always had for the miner; and the "jumper" wonld almost inevitably result from such a cbange as that proposed, for miners in distant inter-mountain regions would hear of the change in the law either too late or not at all.

The proposed change wonld make a bad rule in this, also: In several of the States there are statutes similar in effect to tbe Federal statute, and if the State statutes were not changed so as to become operative *pari passu* with the Federal statute, the situation would invite contention, litigious and otherwise, not that the Federal statute would not prevail—it would, of course,—but the very fact that the Federal statute furnisbed one rule and the State satute another would, of itself, tend to disturb settled conditions.

It is not perceived, either, how the change can be advantageous even in the inter-mountain States. California, Arizona and New Mexico are practically winterless, so far as concerns mining operations, and of course the change of the commencement of the mining year from January 1st to October 1st works no advantage whatever; but in the inter-mountain States, as I view the question, the proposed change is really detrimental to the miner, as it gives him a less available period to do annnal work than he now has, and makes the possibility of "jumping" much greater, because the time of the year would be more available for the stealing of a mine than the bleak and inhospitable weatber that obtains in the inter-mountain mining regions about the first of January.

The excuse that certain of the miners in the silver-producing regions will find the performance of the one hundred dollars' worth of annual labor, etc., a burden this year, on account of the low price of silver, is inadequate. At most, it furnishes occasion for no more than a relief bill, such as has many times been passed for the benefit of pre-emption and homestead settlers whose crops have been destroyed by grasshoppers or by drought. Certainly it is not a good reason for changing the entire law.

EDWARD A BELCHER.

HON. EDWARD A. BELCHER, a lawyer particularly well known in mining circles of the State, has jnst been appointed by Governor Markham to the judgeship of the Superior Court of San Francisco made vacant by the recent resignation of Judge Garber. Judge Belcher's character, abilities and experience eminently qualify him to fill the honorable position for which he has been selected. The appointment is indorsed by the entire public. It is perhaps proper to mention that an article in this issne by Judge Belcher was written before his elevation to the bench.

IN excavating for the sewer in Ohio street, which extends from Park to Porphyry, just east of the Clarence hotel, says the Butte *Miner*, three or four large veins of gold-silver ore, which are rich in both metals, have been cnt through by the workmen. One vein is 15 feet in width, and is so rich in the precious metals that the drillers find it difficult to sink holes. Rnmor has it that the workmen take home large chnnks of the metal every evening and nse them for door weights. If this allegation is true, the ore is just a little richer than any heretofore found in the Silver Bow county.

The Mineral Exhibit at the Fair.

If plans now being formulated are carried out, the display of California minerals at the coming Midwinter Fair will be the most elaborate and pretentious ever attempted; and there is excellent reason to believe that a most complete, instructive and attractive exhibit of mining macbinery and appliances will likewise be made. Mining is a leading industry of California. The pursuit of gold has been identified with the history and progress of the State in sucb a manner as affords no parallel in any other State or country. There are associations and traditions connected with gold hunting in this State that give it an air of romance as thrilling and appealing as the fabled hunt of Jason and the argonauts for the Golden Fleece. The opportunities for a great display, both material and sentimental, have never been exceeded and not, indeed, eqnalled. Many things that are useful and novel can be shown; and it is with much satisfaction that we announce that they will be. Secretsry Ralston, of the State Miners' Association, says in an interview:

"We have had every enconragement, and believe that tbere will be no trouble abont raising $25,000 and in filling the 10,000 feet of space we have engaged. Our idea is to make the exhibit of practical benefit to the public. Among other things showu will be a five-stamp quartz mill with a conceutrating plant attached. Quartz in bulk will be snpplied to illnstrate the workings of the mill. If the ground in the Park should be firm enough we may show the nndergronnd workings of a mine, with a circnlar drift, and take the ore for the mill right out of the ground. This would give people an opportunity of riding dowu a shaft on a cage and of going through a mine without inconvenience. It would be a novel experience, not only to visitors, bnt to a majority of Californians. Another idea is to show the evolntion of quartz-crushing methods, from the arrastra to the stamp mill with concentrator, and in hydranlic mining to show the stages of progress from the rocker and long-tom to the hydranlic mine. There will be an exhibit of monitors and of hydranlic machinery of all kinds. We will show what is being done and how. Suggestions have been made to have a '49 scene, with log cabins, tents, etc. In fact, forty featnres have been proposed, and if our calculations do not miscarry, the mining exhibit will not be the least realistic and interesting on the grounds."

These things are all very good, and without donht the historical feature will be fully developed. In our judgment, it should be made very conspicuous. To the ordinary sightseer the original stamp mill will be quite as attractive as the latest development in that line; the rocker, the long-tom and pan as the concentrator and amalgamator. This part of the exhibit should have some unmistakable reminder of Marshall, Sntter, Bret Harte, and Yuba Bill—gun and all. These things are inseparably associated with mining in California, and no mistake will be made if the general impression of the early history of the industry is thus picturesquely confirmed.

Foundry Notes.

BESINES being engaged in tbe nsual quantity of general work, the Union Iron Works are now constructing the first ten stamps of a 20-stamp mill for the Baradon Mining Company, Gnanaacavie, Mexico. Six pans will be used at present. An 8x16-ft. hoisting engine for the Harqua Hala Mining Company, Arizona, is also about to be shipped.

THE Pelton Water Wheel Co. annonnces that it has acquired by purchase from W. G. Dodd and the Union Works the patents and bnsiness of the Dodd Sigmoidal Water Wheel. The inventor of the wheel is W. G. Dodd, snperintendent of the First street branch, Union Iron Works. It has acqnired much favor among mill-men since its introduction, several years since, and its acquisition by the Pelton Company was brought about, no donbt, by a desire to obtain possession of the best devices and appliances in water-wheel construction. The peculiar merit claimed for the Dodd wheel is in the bucket, which is constructed in sucb manner as to permit the water, after all its energy has been converted into work, to flow from the wheel in natural channels or lines due to the force acting upon it. The bucket is so shaped that the discharge sides are prolonged downward on each side of the propelling jet. The water is received or impinged npon the sharp ridge or wedge in the center, divides, and is discharged at each side below, or at a greater diameter of the wheel than that formed by the line of impact.

THE Pelton Water Wheel Company is now engaged in the construction of four new wheels for the Columbia mill, at Anbnrn, Placer county. The wheels are 6-foot, 4-foot, 3-foot and 18-inch, respectively. The first will be nsed to supply power for an air compressor, second for two Huntington mills, third for the hoisting works, and fourth for the electric plant to light the mine. They will be propelled by 100 inches of water nnder a 420-foot head, and generate 100-horse power. The outfit for four arrastras for Kerr & Co., Sierra City, is also being snpplied. It consists of two wheels (5-foot and 3-foot), a Chinese pump, all ironwork for the arrastras and necessary transmission machinery. Five wheels, two 5-foot, one 2-foot, one 3-foot and one 4-foot, have just been sent to Alaska for the Alaska-Mexican mine, operating in conjunction with the Alaska-Treadwell. A new 60-stamp mill is being constructed there, the machinery being furnished by Fraser & Chalmers. Among other things, a 120-horse power Riedler air compressor, of the type recently described in this paper, will be put in. The mill will nltimately be made 120-stamp, giving a total milling power of the Alaska-Treadwell and the Alaska-Mexican of 360 stamps. Five wheels have likewise just been shipped to Juneau, for the Nowell Mining Company, where a mill of 60 stamps has lately been erected. A single 5-foot wheel has been furnished the Utica (Ward) mine, Boulder county, Colo. It will be propelled by 360 inches of water under a 580-foot head, making 370 revolutions per minute and providing 500-horse power. A Riedler air compressor is being pnt in at this mine. Seven wheels have just been furnished the Redlands Electric Light Company, where a new tri-phase system is being installed by the General Electric Company.

Slickens.

THE Candelaria mines of Mexico made a recent shipment of bullion valued at $36,000.

IT is expected that the Harqua Hala Mining Company will soon declare its first dividend since its acquisition by the English company.

So many men bave applied for work in the Cœur d'Alene mines that owners are discharging men they don't want and employing others.

J. H. PACKARD, superintendent of the McCabe Mining Company, Arizona, died at Big Bug, Oct. 18th, of pneumonia after an illness of only four days.

THE Gem mine at Wallace, Idaho, resumed work Oct. 16th with 25 men and the Frisco with 40 men. If the price of lead goes up, more men will be put on.

MR. FRANCISCO DE P. MUNOZ, delegated by the United States of Colombia to investigate California mining methods, has arrived in San Francisco in pursuit of bis mission.

A MILLION dollars in gold will weigh 3686 ponnds and a fraction. If in "seventy-cent silver dollars." its weight will be 56,931 ponnds avoirdupois, or nearly 28½ tons.

THE Napa Consolidated Quicksilver Mining Company of Napa county, California, paid its fifty-sixth dividend, at the rate of 10 cents per share, amounting to $10,000, on October 2d.

THE Amador County Supervisors have appointed a committee of three, and the Miners' Committee a committee of the same number, to make a display at the Midwinter Fair.

A SYNDICATE is abont to commence developing the large coal fields in Sonora, Mexico, recently leased for a long term of years by Mr. Lyons, the well-known San Diego speculator.

W. S. KEYES, vice-president of the Mining Bureau and a well-known mining man, left for Mazatlan, Mexico, October 26th, to remain nntil spring. He is interested in tbe development of the Guadalonpe mine.

THE Pilot Peak Mining and Milling Company has been incorporated. Directors—M. E. Sanborn, P. T. Turner, J. N. Turner, E. W. Abbey and A. H. Hewitt. Capital stock, $100,000, of which $81,000 has been snbscribed.

THE Catalina Mining and Milling Company has been incorporated. Principal place of business, Los Angeles. Capital stock, $200,000, with Geo. W. Prichard of Las Vegas and J. B. Wagner, W. R. Bacon, L. J. Banks and R. D. Wade of Los Angeles as directors.

A MINING location notice was recently recorded which reads: "I hereby claim 1500 feet of this ground np Big Squaw Ravine in a wobbly direction." The locator desired to follow the course of the ravine and could not do so by reference to any points of tbe compass.

A PORTION of the Midnight Mining Company's property in Nevada City has been sold by tbe sheriff to satisfy a judgment of $1529.90 and costs, against W. H. Conley and others, and in favor of Mary E. Gray and others. It was bid in by Edwin Tilley for the above amount.

A RUPEE contains 180 grains of silver, and an ounce of silver will make a little over 2½ rupees. The value of the coin is affected by the fluctnations in the price of silver. Its normal value in the London market is 11d, but falls far below those figures during times of silver depression.

THE San Juan Mining Company has been incorporated. Principal place of business, San Francisco. Capital stock, $24,000, with F. A. Schueider of Santa Clara county, Jose I. Moraga of Santa Barbara, Charles Cranz Jr., Wm. S. Cranz and H. W. Schram of San Francisco as directors.

THOS. JENNINGS, the well known middle-weight upper drill miner of Colorado, has challenged Thos. Nianes, late of Montana but now of Nevada City, to an upper double-handed drilling match, to take place inside of 30 days, for $100 a side. The match will probably take place at Nevada City.

CORNELIUS RILEY, of this city, interested in the Alison Ranch mine at Grass Valley, says that arrangements are being made by Mr. Davis (the owner of the mine) and others to commence work in the spring. In the meantime matters concerning the Alison Ranch are nearly as they have been for years.

AN aerolite has just been dug np in Yakima Valley, Wash., which fell three years ago. The meteor weighs 12½ ponnds. Imaginative spectators maintain that an angel's face is plainly outlined npon one side of the concave formation; bnt, unfortunately, proof of the celestial character of the aerolite is still not quite complete.

THE Dictator Gold and Silver Electric Mill and Mining Company has been incorporated. Principal place of business, San Francisco. Capital stock, $500,000, with W. H. Swedaker, W. H. Gender, C. A. Stockton, E. McGrath and W. D. Sanborn of San Francisco, E. F. Burks of Los Gatos and F. H. Kellogg of Alameda as directors.

THE editor of the *Examiner* in his answers to correspondents says that no measure has passed Congress for the relief of miners in assessment work. He is mistaken. The measure passed the House, and was also passed by the Senate with an amendment excluding corporations from its benefits. The matter rests there at this writing.

COLONEL W. R. WALLACE, who gave his name to the town of Wallace in the Cœur d'Alenes, and, as its owner, was once worth a quarter of a million, afterward by a turn of fortune being reduced to a financial zero, is again on the "sunny side of Easy street." He is now acting as superintendent of the Ophir gold mine, in Ontario, holds a one-tenth interest in the property, and is reported to have "struck it rich again."

A WASHINGTON PAPER somewhat crudely describes a fine-gold process in the following: "Speaking of saving fine gold brings to mind a process for saving it made recently, part of which is original, the invention of B. E. Craig. It is what he calls

a settler, which is composed of small-sized water pipes placed close together in a tight box, running lengthwise of it, and is somewhere about ten feet long, which he intends to put in use in a few days over at Priest rapids."

TUOLUMNE county is moving to make a fine exhibit at the Midwinter Fair. The best specimens of quartz will be sent. G. A. Richards thus enumerates other features of the exhibit: "There will be a separate exhibit from the noted gold mines. Every variety of marble cubes, slabs, polished and in the rough; granite, soapstone, chrome iron, plumbago, asbestos, copper ores and the various country rocks will be displayed, and there may be some interesting exhibits from our famous caves."

THE Kanaka Mining Company has been organized at Grass Valley. There are 100,000 shares in the company, and all the shares have been subscribed. Following is the board of directors: Wm. Lebar, David Bryan, Duncan Gillis, Wm. Seaman and Thos. J. Mitchell. The officers elected are respectively: D. J. Bryan, president; Wm. Lebar, vice-president; Thos. J. Mitchell, secretary; D. Gillis, Treasurer. The company was formed for the purpose of working a gravel claim at the head of Kanaka creek, near Greenhorn.

THE statement of the Alaska Treadwell Gold-Mining Company for the three months ending Aug. 31st is as follows: Receipts—Gold bullion sold, $200,431; interest received, $72, equal $200,503. Disbursements—Mining 59,290 tons of ore, including deadwork, $34,496; milling same and saving 1175 tons concentrates, $21,291; chlorination, treating 1098 tons concentrates, $8965; general expenses of all kinds, $3381; bullion charges, freight, etc., $2924, equal $71,068. Profit available for dividends, $129,435. The total cost per ton during above period has been $1.20.

THIEVES have been at work in the Mining building at the World's Fair. The Secret Service men suspect that an organized gang, composed of employes, has found lodgment in the building. F. D. Schermerhorn, superintendent of the Idaho mining exhibit, the other day found one of his cases open and valuables worth $3000, and under bond for $2200, missing. The big brick of refined silver owned by the De Lamar Mining Company of De Lamar, Idaho, 32 carats of opals, finished for setting, and two cut and several uncut rubies were gone.

THE gold fields of the Transvaal Republic in South Africa yielded over 136,000 ounces in August, which is the largest product yet recorded in any one month. In round figures a year's product at the same rate would be worth $32,500,000, which is about equal to the annual production of gold in either the United States or Australia. If the Transvaal mines produce $30,000,000 in 1893, there will be nearly $40,000,000 worth of gold mined in 1894 in all probability. It is impossible to tell where the top limit will be reached, but it is probably not many years off.

THE proposition of the silver-mine owners to the miners at Aspen, Colo., looking to the resumption of operations, is as follows: When silver is 80 cents an ounce for a month the miners will receive from $2.50 to $4.50 a day, according to the class of work. When silver is 82½ cents, 25 cents a day will be added. When silver is 85¼ cents, then 50 cents a day will be added. The acceptance of this proposition would give work to 700 men. Over 1000 returned to work in the Leadville mines recently on the same scale. The Aspen miners refused to accept the terms.

SINCE the agreement between miners and mine-owners went into operation in the camp, says a press dispatch, Creede has rapidly recovered its former tone and business thrift. The output, while less in dollars than formerly, is holding at this time nearly the old quantity in tonnage, and the mines are employing close to the old quota of men. In addition development work is being gradually resumed in all divisions of the camp, and unless something now unforeseen develops in the silver situation Creede will go through the winter at something near to the old pace.

NEVADA COUNTY proposes to make an exhibit at the Midwinter Fair separate from the State exhibit. The general Executive Committee is in receipt of information to the effect that the commissioners appointed by the Board of Supervisors (Messrs. George Fletcher, R. L. Thomas and B. M. Shoecraft) and the commissioners appointed by the State Miners' Association (Messrs. S. P. Dorcey, George Mainhart and Fred Zeither) have applied for 6000 feet of space for the purpose of making a creditable display. A special feature of the display is to be the early placer mining methods.

IN speaking of the fineness of Cripple Creek gold, Theo. F. Van Wagenen says: "The gold found is of remarkably pure nature. It will mint close on to $20 per ounce, and bars have been sold which brought $20.40. Cripple Creek is almost on a straight monometallic basis. The amount of milling ore already uncovered and broken is something very remarkable. In several of the mines it stands 10 to 20 feet thick and even more, and careful sampling indicates that it will mill from $5 to $20 per ton. I believe there is ore developed in this camp to date to run a thousand head of stamps for a couple of years."

THE Deadwood *Pioneer* tells how a prospector in Potatoe Gulch makes his tests: Take one pound of pulverized ore, put in a vessel, add water sufficient to saturate and cover one-half inch, add four ounces of salt, boil twenty minutes, then continue at a slightly lower temperature until the pulp is reduced to dryness, stirring continuously. As soon as dry increase the heat until the pulp is red hot, then dash the same in a gold pan containing cold water, pour in three drops of quicksilver and then pan it down, retort the quicksilver and you have the gold. Rub the pulp with the fingers on the pan while panning.

A RECENT steamer from China to this port brought 10,000 sacks of coal from Tonquin, China, for which the owners of the mine are trying to open up a market. It is put up by a patent process in the shape of large bricks, or "briquettes" as they are termed over in China, the bulk of these briquettes being coal dust and disintegrated coal compressed by hydraulic power into the smallest possible compass. Wonderful economy in the generation of steam is claimed for it, and with the cheap labor used in the manufacture the promoters think they can successfully compete with coast, Scotch, English and Australian coals. A large cargo of Japanese coal is said to be on the way here, but several experiments of this sort have been made before without startling pecuniary results. The Tonquin miners have been at work perfecting their briquette-making process for a number of years, and now that it is completed they are hunting a market.

THE resumption of the mines in the Coeur d'Alenes, says the Spokane *Review*, presents startling figures when the quantity of other transactions it involves and the amount of money it adds to the wealth of the people is considered. In round figures it means $100,000 per month more paid to workingmen directly, and indirectly to industries that support as many more families as the payrolls of the mines themselves. The 700 men who will go to work on the mines already in operation by this time will be increased to 1000 before many days. At the lowest wages, $3 per day, with a goodly number receiving $3.50, and a few even more, the round figures are reached without the necessity of exaggeration.

Big Chlorination and Cyanide Works.

Some idea of the scale upon which treatment of tailings and concentrates is undertaken by one company in South Africa may be obtained from the directors' report to the Central Ore Reduction Company, of which Mr. Charles Butters, formerly of Shasta county, California, is managing director. The custom works embrace a complete equipment of chlorination plant, with a capacity of 3000 to 4000 tons of concentrates per month, but which is so constructed that its capacity will be doubled by the erection of one more furnace; four cyanide stations complete and in working order with a capacity of 20,000 tons per month, and one with a capacity of up to 15,000 tons per month in construction. The chlorination plant and buildings, and the stationary cyanide plant No. 4 form the central works, to which are attached the workshops, such as carpenters' shop, foundry, fitters' shops, the offices, staff and workmen's quarters, boarding-house, stables, and Kafir compound, as well as the manager's house, the whole pile of buildings covering an area of 40 acres. The other works are movable and extend over the reef 14 miles.

The stock of tailings bought by the company amounts to 350,000 tons while contracts have been concluded for a further quantity of about 200,000 tons. As the present working capacity is 19,000 to 20,000 tons, which will be increased on the completion of No. 5 plant to over 30,000 tons per month, there is sufficient work on hand for at least 18 months. The company, however, is not going to stop at this, but intends further large extensions, both in cyanide and chlorination works.

The total quantity treated, practically in four months, has been 1382 tons of concentrates and 33,500 tons of tailings.

The output of gold was 13,382 ounces, valued at £47,219.

The average value of cyanide bullion has been £3 2s 7d per ounce; that of chlorination gold £3 17s 8d per ounce.

The actual net profit in four months to the company, allowing for everything (interest charges, wear and tear, labor, extra initial expenses, etc., etc.), has been £4202 5s 3d ($21,000) upon an actual investment of £57,550 ($270,000), or somewhere in the neighborhood of 20 per cent per annum. It is believed that results for the present year will fully justify the expectation of a large profit.

The entire plant has been erected upon the designs and under the supervision of Mr. Charles Butters (late of the Robinson Gold-Mining Company), with whom the board has concluded a five-years agreement as managing director, securing to him, besides a fixed remuneration, a substantial interest in the profits and also in the capital of the concern. The board testifies, in its report, with pleasure, to the amount of energy and untiring zeal with which, in a very short time, these important works have been erected by the managing director, and to which it is due that the first year of the company's history a satisfactory rate of profit has already been earned.

The Comstock Tunnel Company.

The fourth annual report of the Comstock Tunnel Company for the year ending August 31, 1893, has just been issued from the office of the company in New York. The following are extracts:

"The capital stock of the company is $1,000,000, viz., 2,000,000 shares of $1 each, par value. The funded debt of the company, consisting of first mortgage, four per cent, non-accumulative income bonds, remains the same as at the date of our last annual report, viz., $1,908,000. The unissued bonds in the treasury remain as last reported, viz., $861,000. The company has no floating debt, except a balance to become due for legal services in the pending litigation. During the past fiscal year there was declared as applicable to the payment of coupon No. 7, maturing November 1, 1892, the sum of $28,620. Coupon No. 7, maturing May 1, 1893, was passed. Coupon No. 8, maturing November 1, 1893, will also have to be passed.

"The year has been an unsatisfactory one for the company. The general conditions which have brought about this result are too well known to require extended comment. The product of the mines, from which our income is mainly derived, instead of increasing, as we had hoped, has steadily diminished. Against the small tonnage (152,809 tons) and the small gross yield ($2,427,000) for the fiscal year ending September 1, 1892, the tonnage for the year covered by this report has been only 91,423 tons, yielding only $1,653,222.19. The last mentioned amount must be diminished by $571,815.81 (the discount on silver), making it $1,081,406.38, and it is on this that our royalty is calculated. With silver at par, our royalty would have been greater by $14,872.63, no inconsiderable amount in times like these.

"Unfortunately the two elements which tend to reduce our receipts will always necessarily go together; the lower the price of silver, the more it discourages, and hence the smaller the production. And yet it should not be so in regard to the Comstock mines, especially some of them, as their yield consists so largely of gold. During the past year the royalty-paying mines produced $688,111.36 in gold against $963,930.93 in silver, figuring silver at par. While it is true that the loss in discount on the silver yield was as much as 39 per cent, yet taking into consideration that the gold sold at par, such discount on silver renders the average percentage of loss on the entire product only 22 per cent. Some of the mines produced more gold than silver, even figuring silver at par, the yield of the Consolidated California and Virginia mine having been $310,637.40 gold against $247,881.43 silver; and that of the Belcher $65,837.00 gold against $55,536.71 silver, while the Kentuck produced $7,233.99 gold and $7,211.12 silver. In some of the mines, such as the Crown Point and Yellow Jacket, large bodies of low-grade ore containing only gold are known to exist."

The feature of the Comstock ores—their gold-bearing quality—is the hope on which, in view of the present and prospective low price of silver, their continued extraction mainly rests. If the assay value of the large bodies of ore which are known to exist was greater, there would be no reason to doubt that the mines could be kept in active operation for an indefinite period of time. The question is whether this last mentioned result can be attained in view of the alleged low grade of the ore. In our opinion, as already so frequently expressed in the past, this question must be answered in the affirmative, *provided the expenses connected with the extraction of the ores are reduced to the lowest possible basis, and such extraction is carried on in a businesslike manner.*

Placer and El Dorado.

TO THE EDITOR:—The mining outlook in Placer county seems to be somewhat brighter at the present time than it has been for some time past. The work of erecting buildings and getting machinery in place at the Three Stars mine is progressing rapidly. White & Thorpe, proprietors of the Moore mine on Duncan Hill are taking out some very rich ore. Twelve hundred dollars in specimen rock was taken out of this mine one day last week. The Smith Bros. are prospecting for a new pay chute in G. J. Morgan's mine, which is also situated on Duncan Hill about a mile and a half below Auburn. This mine and others situated on the hill have yielded considerable money in the past and promise—with judicious management—to become good paying properties in the future. The most of the gold yielded by the quartz mines in the vicinity of Auburn comes from pockets and nearly all of the runs in this slate formation are of a pockety nature. This section of Placer county, like many more places on the coast, has some fine ledges upon which, if a few thousand dollars were judiciously spent in development, handsome profits would be returned.

It may be truthfully said that the mineral resources of Placer and El Dorado counties are yet only in the infancy of development. While it is true that most of the shallow placer diggings are pretty well worked out, still there is untold wealth in gold locked in the ledges, pockets and seams that fed those placers. It requires prospectors, of good judgment, well versed in their calling, are not afraid of hard work and "roughing it," to discover the source from which the gold came that made the ravines and gulches so rich in some localities. When half of the ledges that liberated part of their wealth to make those placers is discovered and worked, then the output of gold will be greater than ever known before in California's palmiest days.

In El Dorado county some of the old quartz mines that have been worked in former years with but poor success are now being worked to a profit. Notable among these is the Taylor mine, near Greenwood, which is now one of the standard mines of the county. On my recent trip through the northern portion of El Dorado, I find that, like in Placer county, there is more prospecting for quartz being done than formerly, and the outlook for the future prosperity of the mining industry there is good to say the least.

Auburn, Cal., Oct. 21, 1893. ALEX QUARTZ.

Studies in Gold-Milling.

NUMBER V.

[Written for the MINING AND SCIENTIFIC PRESS by J. A. Edman.]

Experience has shown that the size and shape of grain produced vary much from different styles of crushing machines, stamps generally producing much fine sands and slimes, while rolls give a more uniform product and of a size more in correspondence with the screens used. In shape the particles also vary, the rolls producing in hard rock a large proportion of thin and splintery particles, while the stamps furnish more of rounded grains. So in grinding, different machines produce widely different sizes, but not so great a variety in shape of grain, this being mainly determined by the relative hardness of the ores.

As in the preceding pages of these studies, it has been shown that in most gold ores, and in decomposed ores particularly, the gold exists in an extreme division, and consequently when mechanical reduction is attempted, the best means should be employed for that purpose. It becomes of the utmost importance to ascertain the merits of the different machines used for grinding purposes as distinguished from coarse and fine crushers. Granting that rolls and stamps will economically reduce hard ores to 20-mesh*, what machine now known is best fitted to take this or any larger size and reduce it to such dimensions as will effectually set free the gold from its matrix and allow it to come in full contact with mercury under the best conditions for successful amalgamation?

Leaving out of the discussion the many forms of rapid grinders which do not attempt amalgamation, and most of which can only handle hard and dry material, the contest will eventually be between machines of which the grinding-pan and the arrastra are types. And here, although the grinding-pan undoubtedly was evolved from the arrastra, a wide distinction must be made between these two types of grinders as they now exist. The arrastra from ancient times used as a crusher and grinder combined has only of late years come into its proper office as a grinder, and consists essentially in all its present forms of a circular bed of varying diameters, paved with hard rocks for a bottom, on which the grinding is performed by heavy flat rocks from two to four in number, generally called drags, and from 600 to 1200 pounds in weight, moving slowly in a circular path and actuated from a vertical shaft with arms. The rim or curb of the arrastra is formed of rock or wood.

The pan, on the contrary generally of iron or with wooden sides, consists of a cylindrical vessel from two to six feet in diameter, having dies of hard metal fitted to its bottom, while the grinding is performed by iron shoes fitted to a muller and carrier, also driven from the center and generally at a high speed of 50 to 75 revolutions.

Widely differing in construction, as much variation appears in the material on which these machines operate, the arrastra taking rock up to two inches in size, while the pan does most of its work on sands already crushed to 20 or 40 mesh. In their products they approach each other, as both can deliver sands and slimes up to and below 1-1000 inch in diameter.

Since the discovery of the Comstock lode and the adoption of pan amalgamation on most of its ores, the grinding pan has undergone many modifications and improvements and has attained a high state of efficiency, principally as used in silver mills. Among the best forms now met with in gold milling the special grinding and amalgamating pans used in the Boss system deserve mention for perfect design and efficient work. For grinding in charges the Combination pan still maintains its place. In the early years of California gold milling before concentration became general, the great loss by ordinary battery and plate amalgamation and even by blanket concentration, led to a system of grinding partly concentrated tailings which in the larger mining camps, such as Grass Valley and Nevada City, became quite a lucrative industry and gave work to many small custom mills, the gold product generally being derived from the quartz sands carrying fine gold. For this purpose the simpler and inexpensive forms like the Knox pan were then in use. By these means the various styles of grinding pans have become well known to the mining public, especially of the Pacific coast, but even yet gold miners have been slow to avail themselves of their benefits.

In bringing before gold miners the merits of the arrastra it must be understood that the best modern form is intended, and not the ancient styles yet in use in Mexico and Central America, nor those scarcely more modern yet used in California and derived from ancient patterns taken from mills existing on the Italian slopes of the Alps, and operated on this coast chiefly by Italians. Neither is it intended to cite the attempts, generally abortive, to combine the arrastra and grinding pan in a composite machine. The most efficient modern arrastra may be described as a circular bed of from 10 to 12 feet in diameter, paved with cut or well dressed hard and coarse-grained rock like granite or syenite, laid in cement with spaces about an inch wide between bedstones and radiating from centerpost to rim. A centerpost of rock or wood is provided, and a curb of rock or tough wood, protected on the edge and inside by heavy iron plate. An upright iron shaft, with its lower end running in a step let into the centerpost and with its upper end moving in a box secured to a heavy crossbeam, is furnished to a heavy flange keyed to the shaft and to this the arms are attached, the flange being capable of being shifted on the shaft at least a foot. The ends of the arms are braced by rods with swivels, attached to a collar at the upper end of shaft. The drags, from 600 to 1200 pounds in weight, are attached to clamps on the arms by chains fixed to drags by heavy iron pins driven driven into wood plugs set in holes in the drags, and not less than two chains for each stone. The chains are fastened in hook-bolts fitted to the clamps, which slide on the arms, by which means both a vertical and horizontal adjustment of drags is effected. The motive power is water or steam applied from the horizontal to the upright shaft by means of spur or bevel gear, and the revolutions, according to diameter vary from eight to fifteen per minute.

As the arrastra is strictly a grinder the rock fed to it should be crushed by jawbreaker to an average size of one-half to three-fourths of an inch. The most rapid work is done on material from one-half to one-twentieth inch, below which the reduction proceeds slower. In general practice the ore is ground in charges of about 1000 pounds, fed gradually during one or two hours, and the fine grinding continued for two to four hours more. The mercury is introduced when the pulp is ground to a coarse sand (about eight mesh), in quantity enough to make a rather stiff amalgam. When ground to fine sand or slime of from 1-500 to 1-1000 inch diameter of grain the pulp is diluted until a point when the slimes are kept in suspension but the bulk of amalgam settles to the bottom and lodges in the spaces between the bedstones. This point is ascertained by frequent horning of the pulp and requires some skill for its proper management. The pulp is discharged by a gate in the rim of the arrastra and should be run into a settler where it is further diluted, and the finest amalgam with heavy sulphides and some sand is saved for subsequent treatment.

A well-fitted arrastra of the above description will handle from two to three tons of moderately hard quartz in 24 hours; of soft rock from 20 to 40 per cent more, and reduce the ore to an average size of grain of 1-1000 inch. If fitted in pairs, two such machines are generally attended by one man on a 12-hour shift and the cost of grinding and settling varies from $1.25 to $1.75 per ton with water power independently of the cost of the coarse crushing which is small, if a large plant is used.

The first cost of such arrastra is less than a first-class modern grinding pan, and should not exceed $300. A wooden settler capable of handling pulp from two arrastras can be erected for $250 inclusive of driving gear. A plant of ten arrastras with five settlers would cost about $4200, and with a small rock breaker, Pelton water-wheel, line shaft and pulleys, not over $5500, and could work thoroughly from 20 to 40 tons per day according to character of ore.

Attempts to run the arrastra continuously have failed, as the pulp passing over them contains much coarse sand, and screens cannot be used successfully.

The rapidity and quality of grinding is determined to great extent by the nature of the grinding surfaces, both in arrastras and pans. For extremely fine grinding, smooth and hard surfaces are required, and the most thorough mechanical reduction known to the writer is effected in an agate mortar, by which a size of grain of 1-3000 inch can be obtained. When a very fine grinding, as to 1-2000 inch grain, becomes necessary, the operation should be performed in two grinders, the first making a product of fine sand, the second producing an impalpable slime. For arrastra grinders the following rocks will answer, beginning with the coarsest: Coarse-grained granite or syenite; fine-grained granite; coarse-grained quartzite; fine quartzite; tough, massive quartz or hornstone. For pans: Coarse-grained cast iron; chilled iron; hard cast steel.

Long-continued experiments by the writer have shown that a reduction to 1-1000 inch is generally required to set free most of the gold contained in quartz, talcose schist and oxidized pyrites, and in some instances a reduction to 1-2000 inch grain may be needed. When it is considered that the average-size grain produced by a stamp mill is about 1-100 inch, one source of the great loss under present milling systems becomes apparent.

To approximately determine the relative percentages retained by rich sands, ranging in size from 1-40 to 1-1000 inch in diameter, a small lot of rich plate sands from a quartz mill was taken, of a nearly uniform size of 1-40 inch, and subjected to grinding to various sizes, for each of which the gold contents were determined by fire assay, the gold set free being carefully eliminated at each distinct step of the treatment. The results are shown in the following table, where the gold contents of the sand at 40 mesh is taken as the standard, or 100 per cent.

Size of Grain.	Relative Gold Contents.
At 1-40 inch	100%
At 1-100 inch	93
At 1-200 inch	76
At 1-300 inch	49
At 1-500 inch	29
At 1-750 inch	13
At 1-1000 inch	6
At 1-1600 inch	But a few colors were visible under the microscope

The sand treated consisted of quartz 90 per cent, with talcose slate and nearly 5 per cent of oxidized pyrites. The grinding was done in an iron mortar down to 1-500 inch, below that in an agate mortar. Sizes were determined by sieves to 1-200 inch, and below that size by microscopical measurements.

A simple experiment to determine the effect of fine crushing can be made by grinding rich sands or concentrates in an ordinary iron mortar with a smooth bottom, using tepid water to which a little caustic potash or soda has been added, and very little quicksilver, enough to make a pasty amalgam. With moderately fine grinding, this will give a small lump of amalgam. The slimes, carefully saved and reground in an agate mortar until most of the mineral matter will remain in suspension for some minutes, will yield another globule of amalgam varying in size according to the diffusion of the gold, and often being from 20 to 40 per cent of the amalgam from the first grinding.

J. A. EDMAN.

*Mesh when here used indicates number of holes to the linear inch.

Hydraulic Fields of Southern Oregon.

Prof. Leigh Harnett, a mining man well known in Oregon, is of opinion that the hydraulic territory in southern Oregon, from Canyonville to Ashland, is the richest and most continuous on the coast. Says Mr. Harnett:

"From the earliest days it is a matter of history that out of the placer mines of southern Oregon fully $40,000,000 have been taken up to the present time. This large sum was taken from such small portions of the low-lying ground that could be reached by water and worked by sluices. To-day, in Oregon, as once in California, a sufficiency of water is the great consideration; that is, to put under systematic operation the whole range of the rich placer fields of our State, especially the portions suitable to the great hydraulic system. When that day comes Oregon will be the banner gold-producing State of the Union."

The gold flow Mr. Harnett refers to he says is fully 200 miles long without sensible break or intermission. This, he contends, is proved by two facts—the similarity of the gravel formation and the result of the hydraulic pipe wherever water, in even limited quantity, could be obtained at any point of the 200 miles. During the present season there has been an unusual supply of water, and the cleanups, the best of all evidences, have been proportionately good, while all were in advance of past years. Messrs. Sturgis and Hall and Beck, near Grant's Pass, respectively, cleaned up $20,000 and $10,000 clear profit. Below them, the Humphrey and Sterling mines, with the best hydraulic plants, perhaps, in the State, are still to be heard from. The claims on the whole line, at from 10 to 20 miles apart, are under pipe, and therefore the whole length is now really developed beyond mistake—a most important point.

This question of sufficiency of water for thorough work Mr. Harnett hopes soon to prove. Last summer he formed a company in Portland, called the South Umpqua Hydraulic Mining Company, and they have since done good work. The ditch, ten miles long, with a carrying capacity of 5000 inches of water, is surveyed, the whole territory carefully prospected, and a sawmill put up at the head of the mines is now cutting lumber for their dam across the Umpqua and such portions of the ditch as will have to be flumed. Mr. Harnett thinks that the whole of his company's ground is good for five cents a cubic yard. There are two other ditches being surveyed, one 35 miles long and 400 feet higher than the one first mentioned. This ditch belongs to San Francisco men and is intended for lumber as well as mining. Farther south, at Graves creek, John Lewis, of Portland, has commenced an extension for a better supply of water next season.

It is fortunate for southern Oregon, Mr. Harnett thinks, that California has resumed the hydraulic system on a large scale, for when these three ditches are turned over the placer ground and show its real value, large sums will come from California to Oregon. The people of that State, says the Professor, will never lose their love for hydraulic mining, more particularly where the debris question, as in Oregon, can never exist to any extent.

Treatment of Copper, Lead, and Gold and Silver Ores.

[Extracts from Paper on American Improvements and Inventions, Read before the American Institute of Mining Engineers at its August Meeting, Chicago, by James Douglas of New York City.]

The particnlars in which methods of copper smelting have been modified, through modifications of the plants, bave already been described.

Of our two large Eastern smelting establishments, the Baltimore Company follows, in the main, the Englisb methods of reverberatory smeltiug, and treat their argentiferous product partly by conversion into binestone.

The Orford combines cupola practice witb reverberatory concentration, and is contemplating the erection of an electrolytic plant. The Lake establishments melt and refine their conceutrated ores at one operation iu large furnaces modified in desigu to fulfill their special requirements.

At the Arizona carbonate mines all the copper is made by one fusion in water-jacketed cupolas, the matte, which is produced simultaneonsly in greater or smalier quantity, being generally kilu or heap-roasted and added to the ore charge. The pyritic ores of the Verde mines are heap-roasted, matted and conceutrated in converters. In Montana, the ores of Butte, which receive almost without exception preliminary concentration, are in most works roasted in one of the previonsly described mechanical calciners and matted in reverberatory furnaces, the ore being in some works passed hot from the calciner to the reverberatory. The Parrott Company, under the progressive guidance of Mr. Franklin Farrell, were the first in this country to Bessemerize matte, and undonbtedly the first anywhere to make as much as 14,000,000 pounds of copper a year by the pneumatic process. Now all the large Montana works are adopting the same speedy method of matte conceutration, and raising 50 to 60 per cent matte up to 97 per cent black copper at one blow, in the deep converter with elevated tuyers; though, I understand, the bottom tuyers have been used as successfnlly with a very strong blast. The Bessemer pigs of the Parrott works are electrolyzed at the Bridgeport works of the same company, and steps are being taken by all the other copper companies of the Butte district to separate the precious metals and refine the copper by electro-deposition.

The only large concern the sole aim of which is the treatment, apart from the mining, of argentiferous and auriferous copper, is the Boston & Colorado Smelting Company, of Argo, Col. The method employed for tbe extraction of the silver is the Ziervogel; that for the extraction of the gold from the copper bottoms is maintained a secret.

Apart from the argentiferons mattes of Bntte and Arizona, and those made by the Boston & Colorado Company and their affiliated company in Botte, and separated at Argo, most of the precious metal copper matte issues as a by-product from the lead fornace. The silver of the San Juan, Dnrango and other districts of soutbern Colorado is more or less associated with copper glance, and copper is becoming more abnndant in the Leadville ores, and thereby so increasing the snpply of copper-lead matte as to bring Colorado into greater prominence as a copper producer. Argentiferous copper is also imported in considerable qnantities from the Sierra Mojada of Mexico. The copper-lead mattes are treated by electrolysis, at their own works, by several of the lead-smelting companies.

The Pueblo Smelting Company have, after extended experiments, carried into practice a very interesting method patented by Mr. John Crook. The steps of the process as I saw it at first practiced are as follows :

1. The ground matte is immersed repeatedly in a bath of lead, maintained at a temperatnre below the fusing point of the matte, which dissolves a very large percentage of the precious metals.

2. The matte is skimmed from the lead bath and snbmitted to so-called scorification on tbe hearth of a reverberatory. The excess of lead flows off and the volatile constituents of the matte are so thoroughly evolved that, from a very arsenical antimonial matte, excellent copper is made, and the copper and iron are reduced to a sponge.

3. This sponge is fosed with silica, and copper results. Particulars are not published as to the consumption of lead and exact extraction of gold and silver, but the method embodies a nomber of novelties of the greatest interest to chemists and metallurgists.

The Kansas City Smelting and Refining Company are preparing to extract the copper from lead matte by a metbod which I worked out in association with the late T. Sterry Hunt. It depends on the action of snlphnrous acid on copper snlphate, in sointion witb a snfficiency of chlorine to prodnce cuprous chloride. This pure copper salt, insoinble except in a strong chloride solution, readily separates on the injection of sulphurous acid gas from a roasting furnace. If the gas be not diluted by too mnch air, acid is simultaneously generated in excess of the equivalent qnantity, due to the unavoidable, and in this case desirable, presence of some free oxygen in the injected gases. The sub-chloride can be reduced by iron to cement copper and the chlorine recovered as cbloride of iron, or to sub-oxide by lime and the chlorine recovered as chioride nf calcium. The precious metals remain with tbe lron oxide in the matte residues.

There has been, however, but little patronage extended to wet copper methods, mainly because we do not possess, within accessible reach of the chemical centers, any large bodies of cupriferous pyrites, whose residues, after the extraction of sulphnr and copper, would possess value as an iron ore. The treatment of the low-grade oxidized ores nf the southwest by lixiviation is awaiting realization.

In tbe past various attempts have been made to employ old and new wet methods but none have proved commercially snccessfnl nor bave any survived till to-day.

Bessemerizing, as a method of concentrating copper matte, is rapidly displacing the older and slower processes; but with us the machinery does not differ notably from that in vogue abroad. Here, as in Europe, attempts are being made, and with more snccess than there, to utilize the heat generated by the oxidization of sulphur and iron, and thus smelt pyrites without fuel, and also to Bessemerize and smelt at one operation, as was essayed by Hollway, in 1879, in cnpolas of special constrnction. Whatever improvements have been made in the electrolysis of copper are kept secret.

Lead.—American practice in lead smelting is distinguished rather by tbe quantity of work got out of a plant of a given size than by any marked departnres from European methods.

The larger lead fornaces, invariably water-jacketed and driven with a higher blast than of old, smelt in some cases more than 100 tons of charge per fornace, and yet, through skillful metallurgical handling and close attention to slag composition, do work which will compare in perfection with the best in Europe.

Onr prominent lead smelters have bronght more accurate scientific training and acumen to bear on their professional labors than perhaps any other class of the fraternity; yet, withal, their science has not dwarfed their inventive faculties or made them slaves to the teaching of the schools.

Reverberatory smelting in the English type of furnace is little, if at all, practiced in this country. In Mississippi and Missouri, a modified Carinthian hearth, known as the air furnace, is credited wlth producing about 10 per cent of the lead from that region, while over 60 per cent of the pnre lead ores of the Mississippi valley are reduced on a hearth, which differs from the typical Scotch hearth in being water-jacketed, and therefore capable of continuons running.

At the Lone Eim Smelting Works the Lewis & Bartlett process of collecting the lead fumes in bags has been adopted and the heavy losses of this system of smelting have been reduced. The fornaces which prodnce 174,626 tons of onr total of 205,626 tons of lead are large cupolas, growing ever larger, originally designed on the Raschette model, then verging toward the Poltz, and finally reverting to the Rascbette type. They are now so modified in essential details by each smelter that no single fornace can be taken as the exact pattern of the whole. A standard size is now 42 by 120 inches. All are built with a bosh and are jacketed within the zone of fusion. Most are provided with an Arents syphon tap, a discharge built into the crucible wall and communicating with the bottom of the lead well; in all, the superstructure is supported on pillars to facilitate tbe removal of defective sections. In most coke and charcoal mixed is the fuel, but in one instance at least uocoked lignite, mixed with very poor coke made from the same lignite, is used very successfully. Most are fed by hand; some throngh thimbles. In most cases only tbe dust and fume that will collect in long flues is saved; in other cases, sheet-iron chambers, with large cooling surfaces, are used, and in more tban one the Bartlett method of filtering the fume throngh woolen bags, as in collecting zinc-white, is applied. Preliminary roasting is doue in some works in the O'Hara and Bruckner mechanical furnaces. Mr. Matheson, of the Pueblo Smeltiug and Refining Company, has, it is believed, at last perfected a tapplog jacket which, attached to the ordinary water-jacket furnace, permits a continuons flow of slag and the maintenance of the liqnid charge at a constant level below the tuyeres. While the arrangement of the newer works is essentially American (excellent examples nf which are Eilers's works at Pueblo, Col., and Great Falls, Montana), the works being laid out with a view to the utmost economy of labor and the utilization of the utmost efficiency of tbe machinery employed, the only points to which attention may be directed as distinct American inventions and suggestions are the water-jacketed walls, the Arents syphon tap, the Matheson slag tap and the Bartlett method of collecting fumes. No notable departure from accepted foreign practices or appliances is generally made in the departments of refining and parting, if we except the use of Moebins' electrolytic process for treatiog dore bars.

Gold and Silver.—In the field of gold and silver metallurgy more originality has been displayed and exercised by American workers than in, perhaps, any other.

The gold-mill, with its series of automatic operations, is another offspring of California ingenuity. Manual labor is almost entirely replaced by ocular labor; for superintendence, and not for work, is the function of the mill hands. The ore dnmped into the breakers falls into large bins, whence it slides into antomatic feeders, whicb supply the stamps with regolated quantities. The free gold is extracted partly by liquid mercury in the mortars and by copper plates attached to their sides, and partly on an apron of amalgamated plates, over which the crushed pulp flows as it issues from the battery screen. Automatic vanners receive the tailings, separate the sulphurets and discharge the waste. When the power is supplied by water and the stream is divided to Pelton wheels, coupled directly to the separate groups or even pieces of machinery, the absence of intermediate runniug gear increases not only the sense hut the reality of automaticity, and makes a skilifully arranged and thoroughly equipped California gold-mill one of the triumphs of modern mechanical metallurgy.

The treatment of the iron sulphurets, which, in deep mines, invariably accompany the free gold, and sometimes lock up all the precious metals, has been confined, practically speaking, to two methods.

(1.) Smelting with either lead or copper, or alone with the production of an iron matte. The general experience has been that an irom matte is a less perfect absorbent than either a copper matte or lead. In these departments we can point to no notable improvements or departures from European practice, unless it be in a nearer approacb to success in pyritic smelting.

(2.) The chlorination of gold ores, as proposed and practically carried out by Plattner, including the roasting of the ores, the impregnation of the moistened mass in leach tanks by the chlorine gas, admitted through a false bottom, the extraction of the soluble gold hy water, and of any silver which may have been chloridized by hyposulphite of soda, is the method used at Grass Valley and other points. But the slowness of the operation in stationary vats led Mears to substitnte revolving barrels, whereby not only the chlorination, when gas was injected, could be accelerated, bnt the ingredients for generating chlorine cnuld be agitated with the ore itself. A difficulty encountered in the treatment of gold ores, of leaching the mass of pulp when discbarged from the barrel, has been met by constructing lead-lined iron barrels provided with a filter, using the barrel when revolving to effect the solution, and when at rest as a filtering vat, and accelerating the filtration by pressure. Such barrels are constructed of a capacity of eight tons per charge.

The cyanide method has been applied in some cases with admitted success, hut it cannot claim American parentage.

A Western silver-mill has no prototype in the older European practice. It was a Nevada outgrowth of the California gold-mill, employing the same crushing machinery, similarly combined, but substituting amalgamating pans for battery and apron amalgamation (on account of the greater resistance to amalgamation of silver than gold) and settling pans, in which the mercury is collected from the pulp. As usually designed and worked, the ore passes from the battery into settling tanks, whence it is shoveled, in charges of suitable size, to the pans. In them it is subjected for hours to mercury under the grinding action of iron mullers revolving in close proxmity to iron dies secnred to the bottom of the pans. Live steam is usually injected, but the Boss pans are jacketed. Chemicals (salt and snlphate of copper) are generally added by rnle of thumb, or no rnle at all. They undoubtedly play the same part as in the *patio*, the Krohnke and the Freiberg barrel processes, yielding sub-chloride of copper, which aids in the decompositiou of the silver sulphides; but it is difficult to distribute fairly the effects on the amalgamation among friction produced hy the grinding of iron on iron, heat and the reaction due to the chemicals.

In the Boss system the pulp flows continuously through a series of pans and settlers, the reactions being, it is claimed, accelerated by the thinner layers under treatment in each pan.

The Nevada mill and the Washoe process do quick work, but not clean work.

Where the silver ore, to use a Western term, is so "base" as to resist amalgamation, it is crushed dry, salt-roasted, and may then be amalgamated in pans and

settlers. Barrel amalgamation is not resorted to in any of the large mills.

But in this case the Patera process is sometimes used. It was first exteosively applied by Ottokar Hofmann (to whom is also due the system of rapid trongh lixiviation) in Parral, Mexico, in 1868, and since then has been widely employed, oftener in small establishments or by miners who have extemporized a plant out of old barrels than in large works. The only important modification in the process itself is that made by Mr. Russel, of the Marsac mill, Utah, which consists essentially in the addition of sulphate of copper to the solution of hypo. Mr. Stetefeldt has brought his engineering skill to the aid of Mr. Russell's chemistry, and the resulting plant, as designed and running in the Marsac mill, Utah, contains economical devices for the discharge of the leach tanks, for accelerating precipitation and for the collection and reduction of the silver sulphide.

Labor in South Africa.

The monthly report of the Rand Labor Bureau, Johannesburg, South Africa, shows the following number of men (white) employed in 67 of the leading companies for August, with rate of wages and hours of labor:

OCCUPATION.	No. employed.	Rate of wages in American coin per week.	Hours of labor.
Shift bosses	129	$25 00@30 00	8 to 12
Miners	801	22 50@30 00	8 to 12
Machine drillmen	267	27 50@30 00	8 to 12
Bankmen	90	22 50@27 50	10 to 12
Engine drivers	383	25 00@32 50	8 to 12
Pumpmen	32	25 00@30 00	10 to 12
Stokers	29	22 50@27 50	10 to 12
Carpenters	864	25 00@30 00	8 to 12
Blacksmiths	277	25 00@30 00	10 to 12
Fitters	244	25 00@32 50	8 to 12
Mechanics and painters	23	22 50@30 00	8 to 12
Masons	116	25 00@30 00	8 to 12
Amalgamators	226	20 00@27 50	8 to 12
Cyaniders	59	25 00@62 50	8 to 12
Vannermen	22	25 00@32 50	8 to 12
Trammers	19	25 00@27 50	10 to 12
Clerks	120	20 00@25 00	12
Assayers	49	20 00@50 00	12
Total	3,250		

It appears from this statement that the opportunities for labor in South Africa are greatly limited. It is true that the wages are high, but the cost of living is commensurate with the scale of wages. There is no inducement for laboring men to go to South Africa.

A Trip to Columbia Hill.

Writing of a trip to the San Juan ridge, Samuel Butler says in the Grass Valley *Union:* Columbia Hill, like all other towns situated on the San Juan ridge, has a history replete with interest and romance. Tales are related by the pioneers of thrilling adventures with ferocious animals while searching the placers and gulches for gold. This town is one of the earliest settlements of the upper part of the county. In the early '50's, when men were flocking to the newly-discovered El Dorado by the thousands, eagerly anxious to find some spot where they could accumulate a fortune and return to the home of their nativity, this mountain town was organized. To a stranger unacquainted with the topography of the country it seems wonderful, indeed, that these pioneers should find their way in and out of these hills and ravines in such a remarkable manner; and there is every probability that many an adventurer lost his life meandering in search of gold. I have heard old hydraulickers state that it was no unusual sight to see a crowd of men enter the embryotic town laden with long-toms, rockers and pans—crude utensils employed in the early days to disintegrate the gravel and extract the gold. Claims were taken up everywhere, and the surrounding country was speedily settled. But these pioneers only worked such places as could be successfully developed by the meager and antique tools then in vogue; and when these were exhausted they had to resort to new and improved methods for the purpose of working the large auriferous deposits known to exist there. This resulted in the construction of the incomparable network of ditches, costing in the aggregate several millions of dollars, which is found in the eastern part of the county. It also resulted in the invention of the monitor, which has proved a boon to large hydraulic companies.

Situated at Columbia Hill is the famous Eureka Lake and South Yuba Canal Company's mine. This mine is one of the largest on the ridge and has produced fabulous amounts of gold. For a number of years it was successfully worked, and then came the crash in the form of Sawyer's decision. Under the Caminetti law this company applied for a license to resume, and, after proper investigation on the part of the Government Commissioners, the license prayed for was granted and hydraulicking commenced. This company has a long and expensive system of ditches which supplies it with a liberal amount of water. There are several other smaller mines in close proximity to this town, but sufficient data could not be obtained to guarantee an extended notice.

But while much time and money have been devoted to the perfection of this system of mining, the different quartz ledges existing in this section have not been altogether neglected. With the suppression of hydraulic mining the people who had established homes there began to turn their attention to the system of quartz mining. In this venture they have been fairly successful. In this district is situated the famous Delhi mine. This mine has been very productive and has materially replenished the treasury of its owners. It is located in a deep ravine and the topography of the country is so arranged that the mine can be worked to a great depth by tunnels. The length of the ore chute is from 350 to 400 feet, the lower tunnel cutting the vein at a depth of 525 feet. Some valuable quartz has been extracted from this mine, but on account of the immense body of water encountered sometimes it has been found impossible to work the mine and operations have been suspended. The Enterprise is another mine owned by the same company and situated about 800 feet westerly from the Delhi. This mine is also opened up by a tunnel which runs northeast for 300 feet and then makes a turn and runs nearly southeast, where a large deposit was discovered. This mine has also produced some very fine quartz.

Mining, Wages and Materials in Mexico.

Regarding the wages of labor at Chinipas, in the State of Chihuahua, Mexico, Mr. E. G. Holtham, in a paper read before the Institution of Civil Engineers (British) gives the following information:

The wages of unskilled laborers range ordinarily from 75 cents to $1 per day; and of lumbermen, $1.25; masons receive from $1.25 to $2.50, according to their experience and skill; good foremen, $3 to $4; quarrymen and stonehewers, $1 to $1.50; carpenters, $2.50 to $3, and smiths rather more than this.

Miners receive from $1.50 per day for ordinary drill hands to $2.50 or more for experienced men who can prepare and set timbers underground. These prices are for outside work or for tunnelling when mines are shut down or slack.

The cost of rock-tunnelling varies with the amount of blasting required. Short tunnels in hard rock, six to seven feet square, can be driven for $5 to $6 per lineal foot; longer tunnels, in which the disposal of the stuff is more expensive, or which are driven from shafts, may cost double as much. On the railway, tunnelling in hard rock, 13 feet by 11½ feet in main dimensions, equal to about 4½ cubic yards per lineal foot, cost from $15 in the short tunnels to $20 and $22 in the two longest tunnels (208 and 315 feet respectively) per foot run. Excavation in the open cost from a minimum of 7 cents (contract price) to a maximum of 24 cents per cubic yard in deep trenches for foundations; hard gravel or rock requiring no blasting, up to 50 cents per cubic yard. The hardest rock cost $1.25 per cubic yard, including explosives; and some work among heavy boulders under water cost as much as $2.50. The highest contract price on any large cutting was 94 cents per cubic yard, all labor, tools, steel and explosives included.

Masonry cost, for all labor except mortar mixing, in the most favorable situation, $2.50 per cubic yard of rubble walling. Bridge abutments and high walling, $3.75 to $4 75, and lofty piers, $8.50 per cubic yard. Brick arching up to 15 feet span, including centering and mortar of a special quality, $12 per cubic yard. Concrete rammed in molds, with large stones interspersed, cost $2.50 per cubic yard; laid in bags under water, $6 per cubic yard. Dry stone building in culverts and retaining walls on the railway, quarrying included, costs $1.60 to $2.50 per cubic yard.

The hire of a mule and pack-saddle averages 50 cents per day; the wages of a driver who can load and attend from four to six animals is 75 cents to $1 per day. Donkeys could be hired, including drivers, for 25 to 35 cents a day, the higher figure being paid for those carrying the "bote" or water bags. In the rainy season of July and August all animals run loose, and it is scarcely possible to hire them at any price.

The native generally labors only when compelled by necessity to do so. His favorite occupation is agriculture, which, if successful in the summer, ensures him an indolent existence for several months. Slavery has long been abolished by law; but the lower classes readily incur debt which practically binds them to service, as they are liable to be prevented from working otherwise than as their creditors may determine. The employer-creditor is in a position during the slack season of agriculture to furnish working gangs to any undertaking that makes it worth his while to do so. These gangs return to their fields in summer, and may not become again available until near the end of the year, though some of them offer service after the sowing season.

Sulphurets.

An Unappreciative Sketch of an Unappreciated Metallurgist.

It was not his proper name, but they all called him Sulphurets because of certain wonderful results which he claimed to have obtained in experimental operations on "rebellious" silver ores, said experiments having been made by the aid of a frying-pan, to which he had adapted some kind of a muller or stirrer. He had "advanced ideas" on many subjects besides metallurgy. His external costume consisted of a cork helmet, a pair of brogans, a ditto of overalls, and a garment of his own design and manufacture which was a cross between a sack coat and a heavy overshirt. He used neither tobacco, whisky, profane language, nor, to any great extent, soap.

I had not been long in conversation with him when something struck his crank and set him going, or, rather, set his tongue going, which was less desirable. He was that most discomforting of beings, an unappreciated genius; at least he was unappreciated, very much so. His voice was characterized by that peculiar style of melody combined with vigor which marks that of a macaw disporting himself, head downwards, on a perch.

Pointing a dirty forefinger at me, he screeched, "You an' me's pardners! You an' me's pardners!" I was the one his soul had yearned for; I was his affinity; my mind was the oasis in the desert of ignorance and prejudice in which his ardent soul had wandered. I was the only one he had met who was capable of appreciating the great truths he had discovered. His delight was unbounded and irrepressible; mine was of a milder character. I had one partner already, but that circumstance did not disconcert him; we were to be inseparable from that moment—he and I. My old partner and I had claimed a stream of water which we were preparing to utilize, and my new "pardner" and I were to put up a water-wheel which a touch of his genius was to evolve from the simple germ of an old wagon-wheel. We would put up a wheel and work silver ore from Cerro Gordo; we would teach the world how to work silver ore. Had not my new friend worked silver ore in a frying-pan, and was genius like his to be wasted for want of a little money so long as I had some? No! We would go in together; he would furnish the brains, I the money, and together we would once more revolutionize metallurgy and make our fortunes.

Sulphurets was a believer in evolution, and one day he worked himself into a state of unusual enthusiasm. Perhaps it was the consideration of the great things we were going to do which naturally led up to the plans of the Almighty; perhaps he, like some of our parsons, had private information on the latter. With fervid eloquence my new "pardner" unfolded to my feeble intelligence the stupendous vista of an impending mighty development of humanity, till, screaming with excitement, the dirty finger again upraised, he announced the glorious climax in these immortal words: "I'll just tell you what it is, my good friend; God A'mighty's a-goin' to make a blamed fine man one of these days, an' that man's a-goin' to be a Yankee!" In about a week he disappeared; where he went none knew, as none knew whence he came.

Some years later I was at Benton, in Mono county, and one day my quondam friend Sulphurets rode into town on a sort of chariot, which he had improvised from the front wheels and shafts of an old wagon. He was perched above the back of his apology for a horse, on a seat constructed on the ends of two spring-poles attached to the carriage, leaving the space between the wheels for his belongings, not a bad arrangement, by any means. He was still unappreciated and his voice was somewhat subdued, but not so his mighty spirit. He had given the metallurgical revolution a rest, and was intent on a new scheme.

This time it was steam which had to give way before the power of genius. He would drive machinery by the power of explosives, gunpowder, nitroglycerin or anything that would "bust." His fundamental proposition was that the result of an explosion was a vacuum, and, as nearly as I could gather, his plan was to propel his piston in one direction by an explosive, while the return stroke was to be effected by atmospheric pressure.

I suggested chloride of nitrogen as a well-known though little used explosive of established reputation for punctuality and dispatch. I was convinced that his engine would go if he should once get it started. I also believed it would create a vacuum at the spot where he would be at the critical moment, so I encouraged him all I could. But there was a hitch. The encouragement he wanted was the kind that bears the stamp of the U. S. Mint, and of that I had none to spare in exchange for a vacuum.

Finally, though he did not explode and create a vacuum, he went off and left a vacancy which suited me as well. I saw him ride away on his unique and ingenious chariot, and have had the pleasure of never meeting him again.

C. H. A.

Scientific Progress.

The Action of the Eye.

It can be taken as a fact, which the theory nf the action of the eye implies, that for each external impresslon, that is, for each image produced on the retina, the ends of the visual nerves concerned in the conveyance of the impression to the mind must be under a peculiar stress or ln a vibratory state, said Nikola Tesla in a paper read before the Franklin Institute. It now does not seem improbable that, when by the power of thought an image is evoked, a distant reflex action, no matter how weak, is exerted upon certain ends of the visual nerves, and, therefore, upon the retina. Will it ever be within human power to analyze the condltion of the retina when disturbed by thought or reflex action, by the help of some optical or other means of snch sensitiveness that a clear idea of its state might be gained at any time? If this were possible, then the problem of readlng one's thoughts with precision, like the characters of an open book, might be much easier to solve than many problems belonging to the domain of posltive physlcal science, in the solution of which many, if not the majority, of scientific men implicitly believe. Helmholtz has shown that the fundi of the eyes are themselves luminous, and he was able to *see*, in total darkness, the movement of his arm by the light of his own eyes. This is one of the most remarkable experiments recorded in the history of sclence, and probably only a few men could satisfactorily repeat it, for it ls very likely that the luminosity of the eyes is associated with uncommon activity of the brain and great imaginative power. It ls fluorescence of the brain action, as it were.

Another fact having a bearing on thls subject which has probably been noted by many, since it is stated in popular expresslons, but whlch I cannot recollect to have fnund chronicled as a positive result of observation, is that at times, when a sudden idea or image presents itself to the lntellect, there is a distlnct and sometimes painful sensation of luminosity produced in the eye, observable even in broad daylight.

Two facts about the eye must forcibly impress the mind of the physlcist, notwithstandlng he may think or say that lt is an imperfect optical instrument, forgetting that the very conception of that which is perfect, or seems so to him, has been gained through this same instrument. First, the eye is, as far as our positlve knowledge goes, the only organ which is *directly* affected by that subtile medium which, as sclence teaches us, must fill all space; secondly, it is the most sensitive of our organs, incomparably more sensitive to external impressions than any other.

This divine organ of sight, this indispensable instrument for thought and all intellectual enjoyment, which lays open to us the marvels of this universe, through which we have acquired what knowledge we possess, and whlch prompts us to and controls all our physical and mental activity—by what ls it affected? By light! What is light?

It is beyond the scope of my lecture to dwell upon the subject of light in general, my object being merely to bring presently to your notice a certain class of light effects and a number of phenomena observed ln pursuing the study of these effects. But to be consistent in my remarks, it is necessary to state that, according to the idea now accepted by the majority of sclentific men as a positive resnlt of theoretlcal and experimental investigation, the various forms of manifestation of energy which were generally designated as "electric," or more preclsely "electro-magnetic," are energy manlfestatlons of the same nature as those of radiant heat and light. Therefore the phenomena of light and heat, and others besldes these, may be called electrical phenomena. Thus electrical science has become the mother science of all, and its study has become all-important. The day when we shall know exactly what "electricity" is, will chronicle an event probably greater and more important than any other recorded in the hlstory of the human race.

Dimensions of the Fixed Stars.

Prof. E. S. Holden, director of Lick Observatory, writes as follows to the *Morning Call* under date Oct. 13th: I desire to give some brief account of a very important dlscovery which has lately been made at the Lick Observatory by Professor Campbell. His paper containing the technical details has just been sent to the sclentific journals, and it is a proper time to glve a more popular account.

Our knowledge regarding the stars has long needed the addition of one fact. One questlon has hitherto remained unanswered; namely, wbat are the actual dimensions of the stars, or of any one star?

The distances of a number of stars are quite accnrately known, considering the difficulties of the determination. The masses of a few stars are known, and these masses are not very different from the sun's mass. They are at least of the same general order of magnitude. The chemical constitution of many of the stars is well known from spectroscopic observation. The motlons of many stars in the line of sight—joining the earth and the star—are also well known from slmilar observations, and their motions in directions at right angles to the line of sight are known from observatlons made with meridlan instruments.

When we consider the enormous distances of stars in general and the comparatlvely small amount of light of each star, it must be admitted that much has already been learned regardlng them. One datum is still lacking. What are their actual dlmenslons? or what is the actual diameter of any one star? This question has been hitherto unanswered, and it is a capital one. As the stars in general are of the same order of mass as the sun, it is to be presumed that they are also of the same order of size. But it is a question needlng solution.

A very ingenious method for doing this has been invented, and it will probably be tried at Mount Hamllton. It is so dellcate, however, and beset with so many practical difficultles that while the principle of the method is entirely correct, success in lts practical applicatlon is very doubtful.

The question has, however, been solved by Professor Campbell for one star in an unexpected way ln the course of his spectroscoplc observations. The principle employed by him has previously been applied with reference to the sun in the same manner. The solar atmosphere contains many different substances so highly heated as to give out light. These substances are arranged in the sun's atmosphere in the order of their densities, the heavier ones lower and the lighter ones hlgher. The length of the spectral lines of each substance tells the height to whlch it extends. This observation is not very difficult in the solar spectrum, but it was entirely unexpected when Professor Campbell found a star (D. M. 30 deg., 3639) with a bright line spectrum surrounded by an atmosphere of hydrogen gas of such enormous extent as to be measurable.

This hydrogen sphere surroundlng the solid nucleus of the star is five seconds of arc in angular diameter. When the distance of the star ls known (and observatlons to this end are in progress) this angular dlameter can be expressed in miles. Then for the first time we shall know *the actual dimensions of one of the fixed stars*. This discovery of Professor Campbell's ls absolutely unique, and it opens an entirely new field of knowledge. It is so important that it should be known at once.

Skin-Grafting at San Diego.

A wholesale operation at skin-grafting has just taken place at San Diegn. About three months ago Mrs. W. Cole was terribly burned about the face, arm and body by the explosion of a gas stove. The left arm lost all its cutaneous covering, the burn extending into the muscular tissues so that from the shoulder to the wrist it was but a mass of raw flesh. The right arm was burned only from the elbow to the wrlst. Another burn covered a surface of over a square foot on her right side from the hlp upward.

The skin refused to grow on the mass of raw flesh, and Drs. H. E. Crepin and P. C. Remondino, who were called in, decided that grafting was necessary.

On October 18th, 40 persons assembled at St. Joseph's Hospital for the purpose of offerlng a cutaneous contribution to the suffering woman. Mrs. Cole was taken to an operating room, where, being placed on the table, the left arm—the only one operated upon that day—was exposed and treated with an antiseptic solution of boracic acid and soda.

The visitors came in one at a time with their arms prepared by an assistant, and Dr. T. L. Magee deftly removed the grafts from their arms. These were from the slze of a grain of wheat to the size of a silver dime, taken only skin deep, the instruments used being an oculist's tissue forceps and a pair of ocullst's curved scissors. The grafts were dropped into a bowl of warm water containing a little of boracic acid and soda borate. The number of grafts taken varied with the endurance and physique of the giver. It mlght also be added with the amount of their Christian zeal and fervor. Several became faint, and the Sisters of Mercy were kept busy administering stimulants to the weak. One, a man, fainted outright and had to be put to bed.

The arm was finally covered from shoulder to wrist, and it was then dressed in molst carbolized gauze. Over these layers came several layers of indoform gauze, then several layers of absorbent cotton prepared in boric acid, then more layers of lodoform gauze, and finally a roller bandage.

Two days later the other arm was likewise treated, the lodge of Elks generously contributlng a number of their members to the needed sacrifice. Among these were Engene Daney, a Past Exalted Ruler of the order, and several of the lay members of the order. James Connell, one of the Elks, and Mr. Fish, also of the same lodge, contributed liberally of the skin over their biceps muscles. Several other gentlemen of the order had previously left their quota of epidermis with Dr. Remondino, who took it to the hospital in a small jar.

Mrs. Cole is resting easy, and her physicians have strong hopes of her speedy recovery. It will take the grafts about a week to become firmly rooted, after which, by a process of pollferation, they will branch out and coalesce so as to cover the entire arm.

The other method of skln-grafting, by planing off a large surface of thln skin from the body, usually the thigh of the patient, was not adopted in thls case, as such a procedure requlres an anesthetic and Mrs. Cole's condition would not admit of its administration. By this method sufficient skin could have been taken from two or three persons—layers several inches square and as thin as a postage stamp—to have covered both arms and sides.

This is the second case of skin-grafting that has been performed at the hospital within a year, another case—an elderly gentleman who had suffered a great loss of skin over the right breast from the ravages of a carbuncle—was successfully treated by skin grafts. One of the physiclans who operated upon the two latter cases says that snch plastic operatlons are naturally very successful in the mild San Diego climate.

Mechanical Progress.

Natnral Gas.

The rapid decrease in the output of gas wells in the different sectlons of the country shows, despite the fact that wells are being drilled, that the natural-gas supply is not lastlng nor equal to the demands. The Indiana gas fields, that were for a time so productive as to lead to the bellef that the regions about the gas-producing belt of that State would soon be a bee-hive of industry through the lntroduction of numerous factories, are rapidly playing out. In other parts of the country the output is decreaslng to a similar extent, and at the present time gas for other than heating and lighting purposes is difficult to obtain.

The era of natural gas has shown the desirability of gas as a fuel to such an extent that it is wlth reluctance that any one who has used this fuel will return to the use of coal, and this leads the *Stationary Engineer* to believe that mannfactured gas having a high heat value will be produced by companies and dlstributed for heat and power purposes to an extent approaching that of the natural product ln favored localities. The amount of gas suitable for heating and steam-making purposes whlch can be obtained from coal generally exceeds the amount suitable for illuminatlng purposes, and for that reason it is altogether probable that producer gas, as it may be styled, will soon be supplled in large quantities. With works establlshed for this pnrpose, there is little question as to the demand for the product, providing it could be supplled at a reasonable price, for with an eqnal heating value to that of coal, when price ls compared, the gas would be preferred on account of its cleanliness and the convenience found in its use.

Treating Stones for Construction.

Architects have lately called attention to the desirability, in the case of stones to be used for lmportant purposes, that it be quarried, stored and seasoned for some time before being hewn and placed ln the walls, the natural sap being by this means allowed to evaporate and the stone tested as to its quality; it is admitted that this method would add to the cost, but the money would be well spent, if this precaution prevented the washing of such stones, by rains, frost or atmospheric influences, whlch, especially in cities, soon act on the surface of a newly quarried stone, says the *Builder and Woodworker*. On the other hand, stone is quarried one day and built the next in a green state, and must be considered unfit for use; that ls, not in condltion—lt is at its weakest—its pores are open and ready to absorb not only moisture bnt the gaseous and disfiguring lnfluences which tend to its destruction. It is well known to every hewer that to get a polished surface on a stone that has lain for some time is very different from what is obtained on one fresh from the quarry—a fact which of itself ls regarded as sufficient evidence to warrant the course recommended, namely, to thoroughly season the stone before using.

A Sand Suction Dredge of 4000 Tons per Hour Capacity.
